Dr. A. Rose, in his *Napoleon's Campaign in Russia* (published by the author, 173 Lexington avenue, New York), gives what he calls a medico-historical account of the invasion and retreat. From the defective medical data available he has gleaned considerable information. He shows that there was a deplorable absence of system as well as a lack of ordinary medical supplies in the Grande Armée. Small wonder that its ranks were ravaged by typhus, dysentery and ophthalmia. The book indicates research, but is badly planned and constructed, and its offenses against the rules of sequence, syntax and punctuation are many and striking.

A Genuine Critic

One of the recent additions to the neat and compact *New Universal Library* (Dutton, 50 cents) is a volume of *Essays on English Poets and Poetry from the Edinburgh Review,* by Francis Jeffrey. This Jeffrey, too, was frequently a hanging judge, but one forgives him all that and more in returning to his criticism from the spineless writing that passes for criticism today. Nor have we any quarrel with the long-winded reviewer because his point of view is less favorable than our own today to Wordsworth and the Romantics. Jeffrey, for all his want of delicate perceptions, is always honest, and he makes a fine halfway house for the traveler along the post-road of our criticism, from Dr. Johnson to Professor Babbitt. He lies between the ancients and the moderns, as Mr. Saintsbury says; pretty thoroly emancipated from Augustan taste, but by no means acclimated in his own generation.

It is true that Jeffrey was fortunate in

his contemporary subjects—poets named Burns, Byron, Keats and Wordsworth; a poet who was the author, also, of the Waverley Novels. But his best pages are not given, exclusively, to geniuses of the first water; and in discussing Campbell and Rogers and Felicia Hemans he was certainly no better off than the modern critic who can find among the writers of the age men like Yeats and Noyes and Watson, and women like Josephine Preston Peabody. Some of Jeffrey's pages are devoted to Shakespeare and his critics—and Shakespeare lives today, and still has interpreters who invite critical discussion on their own account. Possibly Jeffrey is most characteristic in his account of Crabbe, to whom he gives a hundred pages. We of today have John Masefield and W. W. Gibson: who are certainly fully as tempting subjects as the Rev. George Crabbe, author of *The Village* and *The Borough* and *The Newspaper.*

A little unfortunate is the omission from the collection of the 1802 review of Southey's *Thalaba,* which served as the vehicle of Jeffrey's first counterblast to the Lake Poets, and was really a comment in retrospect on the startling *Lyrical Ballads* of 1798. His brusque declaration there that poetry exists under "standards fixt long ago by certain inspired writers whose authority it is no longer lawful to call in question" does much to explain the tenor of his criticism. The well known *This will never do* is reprinted, naturally; the less familiar notice of the *White Doe* is a particularly happy inclusion, for it illustrates to perfection the flippant paraphrase which was so often Jeffrey's weapon.

A Study of the Princeton Battle

The Battle of Princeton, by Gen. Alfred A. Woodhull (Princeton: The Falcon Press), is a twenty-two page pamphlet recounting the engagement of January 3, 1777. It is a detailed acount of the various movements of the battle, and is based upon a careful study of sources as well as a topographical survey of the field, which remains today much as it was 136 years ago. The statements and opinions put forth regarding the still unsettled questions are tentative and are published to bring out criticism and further data. A fuller work is contemplated for the near future. To the author the Princeton battle was one of the most important engagements of the War of Independence, since had Washington been defeated, there would probably have followed a complete collapse of armed resistance to Great Britain. The pamphlet is dedicated to the Society of the Sons of the Revolution in New Jersey.

Literary Notes

Rudyard Kipling loves animals because they are like human beings, and Jack London loves people because they are like animals, but Charles G. D. Roberts, author of *The Fleet of the Furtive,* loves animals because they are animals. This book is a collection of sixteen short stories dealing with animals and the great outdoor (Macmillan, $1.35).

Travel in unknown or uninhabitable regions carries with it the spice of adventure and the excitement of chance. The satisfaction and refreshing change which two women found in such a twenty-days' trip from Cairo to Fayoum and back, as well as the scenery and experiences along the route, are described in a simple and pleasing fashion by Frances Gordon Alexander in her *Wayfarers of the Libyan Desert,* published by Putnam.

The Baird Lectures, by Professor W. P. Paterson, are well worth careful reading by those interested in the present trend of theological thought. *The Rule of Faith* (Doran, $1.50) includes an able and timely discussion as to the most adequate repository of the Christian revelation, and a historical definition of the substance of Christian doctrine itself. There is a remarkable chapter giving a most just and appreciative estimate of "The Genius of Roman Catholicism."

The announced intention of the editors of the Wisdom of the East Series is to publish such translations from Oriental philosophy as will give the West a knowledge of the great ideals of the East. To this end they give us Yang Chu's *Garden of Pleasure* (Dutton, 40 cents), presenting a smiling philosopher whose sole remaining fragment, produced 300 B. C., makes Max Stirner sound old-fashioned. His idea of a perfect world is one in which no one would part with one of his own hairs for the benefit of others, or take the universe as a gift, and he explains himself with a demure and disconcerting sweetness.

Three Comedies, "The Newly-married Couple," "Leonarda" and "A Gauntlet," by Bjornsterne Bjornson, appear in one volume in Everyman's Library (Dutton, 35 cents. The arrangement shows the development of his technique from the conventional comedy of the first to the free naturalism of the play that threw a gauntlet into the face of society in the eighties, and it is said broke off hundreds of contemplated marriages in Norway. But with all their buoyant vitality it is curious to see how these plays already show their age, even in comparison with Ibsen.

Fifty Years Ago

THE COLENSO POETS

The Colenso poetry, thus far elicited, would form a small volume. We give some extracts in advance of any such collected publication:

A bishop there was, of Natal,
Who took a Zulu for his pal;—
Said the savage, "Look here,
Ain't the Pentateuch queer?"
Which converted my lord of Natal.

My Dear Colenso:
With regret
We hierarchs, in conclave met,
Beg you, you most disturbing writer,
To take off your colonial miter,
This course we press upon you strongly.
Believe me.
Yours most truly, Longley.
Lambeth.

My Dear Archbishop:
To resign
That Zulu diocese of mine,
And own myself a heathen dark,
Because I've doubts about Noah's ark;
And feel it right to tell all men so,
Is not the course, for
Yours, Colenso.
Kensington.

You ask why Colenso doesn't like Moses.
Well, between us, the reason, as I suppose, is,
(How rarely human jealousy slumbers!)
They've both of them published a book of Numbers.

From a cartoon by Rollin Kirby in the New York *World.*

SURVEY of the WORLD

Do You Want Elk in Your State?

The long-promised distribution of elk from Jackson's Hole and Yellowstone National Park has begun. Thousands of the animals are now being rounded up by cowboys on the over-stocked winter range in Wyoming and Montana, and are being shipped by the carload to States that have sent in requests for them.

A carload of eighty elk, rounded up on the Yellowstone Park region and shipped from Gardiner, Mont., the northern gateway to the Yellowstone, arrived in Denver the other day on their way to Arizona, where they will be turned out upon a new range. They will be protected from hunters under state laws and will be given every opportunity to increase.

In the last few weeks herds of elk have been sent in this way to Pennsylvania, West Virginia, North Dakota, Washington, Oregon and California. Many other states have put in applications for elk, and will be provided with shipments as fast as the animals can be rounded up. It was prophesied that when this plan was adopted the elk would not stand shipment, but the percentage of loss has been small. Only one of the Arizona consignment died en route. To keep them healthy it is necessary to give the elk a rest every day, so they are unloaded from the cars and put into convenient corrals, to proceed on their journey again after a few hours.

The Government was forced to adopt this plan of distribution to prevent the elk in the West from going the way of the buffalo to extinction. Most of the elk in the Rocky Mountains had ranged north until they reached the Jackson's Hole region south of Yellowstone Park. Here they congregated

THESE ELK CAME TO A SETTLER'S FARM IN WINTER

The Yellowstone Park country is overstocked and food is scanty in the cold months, so the Government Biological Survey is distributing herds to states which ask for them.

HERD OF ELK ON A WINTER RANGE, JACKSON'S HOLE, WYOMING
Thousands in this region were fed by the Government to keep them from starvation.

in vast herds, an estimated total of from 25,000 to 100,000 head. D. C. Nowlin, former Game Commissioner of Wyoming, who is now at the head of the work of transportation carried out by the Government Biological Survey, estimates that the smaller number is nearer correct.

Last year Congress appropriated a considerable sum for the care and feeding of the Jackson's Hole elk, which were starving in the deep snows. Government employees, aided by ranchmen, carried hay to the elk ranges, where in the early spring they found hundreds of calves, as well as older elk, dying of starvation. The lives of thousands were saved by feeding; at the Crawford Ranch 3000 were fed and only twenty grown elk died. It was soon demonstrated, however, that this relief was only temporary. It is estimated that the Government has fed about 1000 tons of hay per season to the elk since the work of preservation started. To continue this indefinitely would be tremendously expensive, so it was decided to distribute the elk among the states applying for herds and guaranteeing transportation expenses and protection to the animals after their arrival.

Many states have taken advantage of this offer. Probably 1500 elk have been shipped, and this number will be trebled before the season has ended. The elk are rounded up in the deep snows and driven to Gardiner by ranchmen, state game wardens, forest rangers, and Yellowstone Park employees.

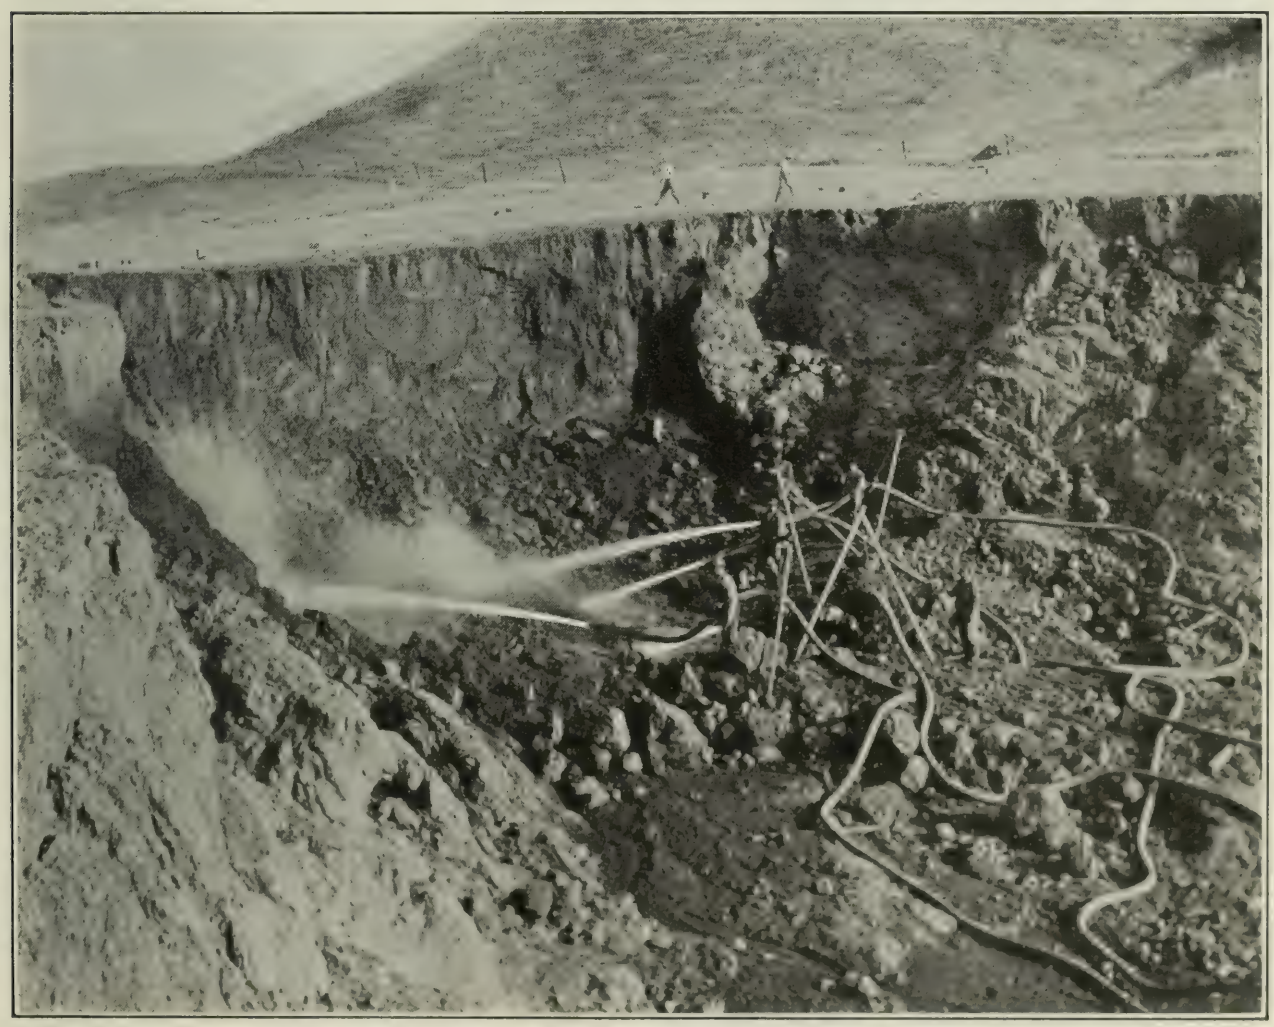
In all the Government has appropriated close to $100,000 for elk protection. The policy is generally approved, as it will replenish the depleted elk ranges of many states, and will give the fast-disappearing species of this country a new lease of life. A few states, which have not had elk hunting for generations, will be enabled to issue licenses for brief periods each year.

The work is unique. Had similar measures been undertaken in behalf of the buffalo, the nation would not now be mourning the almost total loss of those animals, which at one time were much more numerous in the West than are the elk today.

20,000 Leagues Under the Sea

One of the reasons formerly urged against the existence of living creatures in the abysses of the ocean was the supposed absence of oxygen there. It was deemed impossible that any considerable quantity of oxygen could exist at great depths. But discoveries within recent years have shown that there is no lack of oxygen even "twenty thousand leagues under the sea."

The explanation is that the cold water of the polar regions, charged with oxygen from the atmosphere, creeps along the bot-

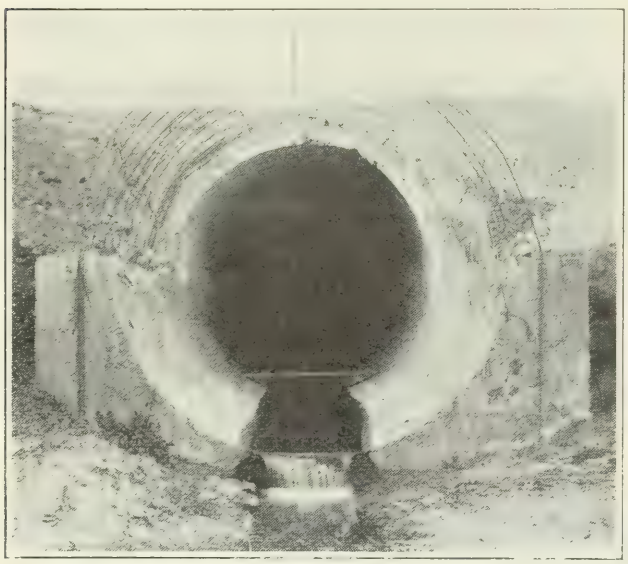


tom toward the equator, from both poles, and thus carries a supply of oxygen over the whole vast floor of the oceans. The surface water moves toward the poles, and so a great system of circulation exists. Were it not for this world circulation, Nutting has pointed out, it is altogether probable that the ocean would in time become too foul to sustain animal life, at least in its higher manifestations, and the sea, the mother of life, would itself be dead.

Making a Dam with Water

The second largest hydraulic dam in the world, surpassed only by the Gatun structure on the Panama Canal, is the San Fernando dam, the most remarkable engineering feat in connection with the building of the Los Angeles aqueduct. The giant barrier has a length of 15,000 feet, is 700 feet wide, and embraces an area of 23,000 acre feet. 2,700,000 cubic yards of material must be placed to hold back the 8,000,000,000 gallons of water, which will be its capacity. It is being constructed by engineers in the employ of the city of Los Angeles, and will be ready for use within a few months.

The dam is being built with steam shovels and pumps. Where the work can best be done by the shovels, these machines are employed, but the greater portion is accomplished with hydraulic monitors and centrifugal pumps. The water is elevated into the aqueduct from the Owens River by a three-stage, direct-connected, electrically operated centrifugal pump, and flows approximately eight miles thru siphons and tunnels to the supply pipe. This has a length of 16,000 feet, is fourteen inches in diameter and composed of riveted steel. Branch pipes extend from the main carrier and deliver to three hydraulic monitors.



The monitors direct their crushing streams of water against the convenient hillsides and wash thousands of tons of earth down to where the centrifugal pumps are waiting. The pumps gather up the water and earth and deposit the earth on the walls of the dam. Four parts of water accompany each part of earth and 400 to 500 cubic yards of material are deposited each hour. As the earth is placed in position the released water flows back to the hydraulic monitors for further use. In addition to the three monitors supplied by the

WASHING DOWN THE HILLS WITH HYDRAULIC MONITORS FOR THE SAN FERNANDO DAM

big pipe, a fourth is operated by water from a pump.

The lower outlet of the dam is ten feet in diameter. Thru this the entire volume of the Owens River will flow—30,000 miner's inches—every twenty-four hours. Four or more pipe-lines will be provided to convey the water to designated points. The aqueduct is intended to supply the city of Los Angeles with ample water for domestic purposes, and also for the irrigation of the San Fernando valley.

OUTLET OF THE SAN FERNANDO DAM

Work for Convalescent Consumptives

The State Forester of Wisconsin, Mr. E. M. Griffith, proposes to put a portion of the State Forest Reserves, comprising some 400,000 acres and lying within the wonderful lake region of northern Wisconsin, at the disposal of convalescent consumptives.

The state is planning to reforest, within the next year or two, 2000 acres of land, and Mr. Griffith thinks that work in the forest nursery and in planting the seedlings is especially suitable to the weakened condition of a convalescent consumptive patient. The legislature is therefore to be asked for an appropriation of $5000 a year, which will cover the cost of building and keeping in repair the wooden shacks in which the patients would live and also the salaries of a doctor and nurse.

At first a patient might not be able to work more than four hours a day, but at 15 cents an hour, he would have earned 60 cents, or more than his board for one day, and all that he earned above the cost of his board would be credited to him, so that when cured he could leave the sanatorium with at least a small amount of money.

Wisconsin already has a splendidly equipt tuberculosis sanatorium at Wales, but the chief difficulty there, as elsewhere, is to secure light outdoor work for patients. Many of them are from cities, and because of their very slender means are obliged to return too soon to their work in factory or office, where the long hours, combined with the lack of fresh air, frequently results in a serious relapse and sometimes death.

For these reasons the doctors of the state have welcomed enthusiastically Forester Griffith's plan.

This is not an absolutely new idea. The State of Pensylvania as far back as 1902 brought consumptives to her forests. Today there is on Mt. Alto a sanatorium of 850 patients under the supervision of the State Board of Health. The Wisconsin plan differs, however, from this, in that Wisconsin will build the shacks and feed the patients, and take only convalescents.

Please Pass the Udo!

Udo salad, udo on toast, udo soup—which sounds most appetizing? The Bureau of Plant Industry of the Department of Agriculture stands sponsor for all of them; for while the epicure's prayer for a new animal is yet unanswered, the United States Government is introducing new vegetables to chef and housewife as rapidly as possible.

The udo comes from Japan. It is not hard to raise. Like celery, it must be blanched.

A SINGLE HILL OF UDO
The drain tile cover has been removed and the shoots are ready for cooking.

UDO SHAVINGS SERVED WITHOUT COOKING AS A SALAD

The shoots, which are the edible part, are grown in darkness, in forcing trenches or frames during the winter, or under some light-tight cover in the open garden. Sections of six-inch drain tile, plugged with boards or cement, small kegs, or large cans may be placed over the roots before the shoots appear in the spring. The shoots are cut and handled like asparagus. The department issues full directions for cultivation.

The flavor of udo is peculiar, with a suggestion of pine. The accommodating bureau gives the formula for cooking: "Peel the shoots and drop them into cold water. Cut them into four-inch lengths. Boil them in salt water for ten minutes, then change the water, adding a fresh quantity of salted water, and boil until quite soft. Prepare a white sauce such as is used for cauliflower or asparagus, put the udo in it and allow it to simmer until thoroly soft. Serve on toast in the usual way. If there is too much of the pine taste in the shoots after preparation, a second change of water will remedy this.

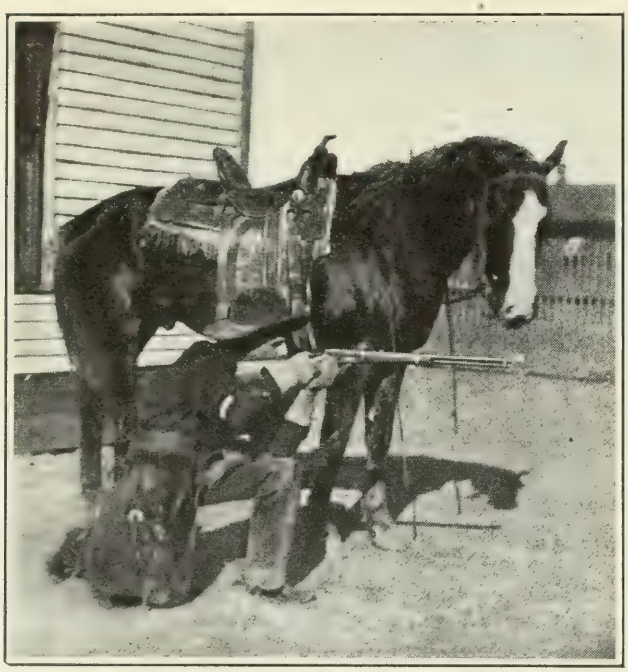
"Those who learn to like the wild flavor of the udo when cooked will want to try it as an uncooked salad, in which form it is most attractive. To do this, peel the shoots, cut into three-inch lengths and then shave the stems into thin shavings, letting the latter fall into ice water as they are made. Allow them to soak in ice water for a half hour or so to remove the turpentine taste and then serve with a French dressing of vinegar, olive oil, salt and pepper. Do not dress the shavings until just before serving, as they become stringy on standing in oil.

"The butt ends and pieces too small for salad can be made into an excellent soup."

The Texas Rangers

When the present uprising in Mexico first began to assume serious proportions, Governor Colquitt threatened to call out the Texas Rangers to put an end to the lawless killing of Mexicans on American soil. This has served to bring again into prominence the most picturesque set of legalized fighting men in the United States.

The Ranger Organization was created about forty years ago, primarily for the purpose of frontier protection. But Texas no longer has a frontier; the Rangers have helped clean it out.



From the time the Ranger Organization was first established its members, forty in number, have every one been picked men, proved experts in marksmanship, at home in the saddle and absolutely fearless in the face of any danger. Most of them were formerly cowboys, and when they leave the Ranger service they usually return to the ranch.

"There are some folks," says Captain "Billy" McDonald, long in the service, "who think that because the boys are always ready to fight like a bunch of wildcats they must be a reckless, rowdy set of men. But they are wrong. The Rangers are just naturally as peaceful and God-fearing a lot of men as you'll find anywhere. There's Captain John R. Hughes, for instance. He's been a Ranger for nearly thirty years, and he's killed a lot of men, but he's a great Sunday school worker."

It may be remarked of Captain McDonald himself that a few years ago he shot and killed four Mexicans who were firing upon him from ambush in a remote locality of the lower Rio Grande border, and the next Sunday he was back in Brownsville and occupied a front seat in one of the churches at morning and evening service.

The conditions existing along the Texas frontier at the time the Rangers were organized in 1876 were peculiar. The cattle raids from the state of Tamaulipas, Mexico, into Texas commenced with what is known as the "Cortina War," in 1859 and 1860, an occurrence without parallel in our history. A single lawless ranchero with a band of friends captured a town of nearly three thousand inhabitants, not only defying, but defeating the forces of the State of Texas, and then carried on a war against the combined forces of Texas and the United States for more than five months.

The whole country from Brownsville to Rio Grande City, 120 miles, and back to the

A TEXAS RANGER READY FOR ACTION

Arroyo Colorado was laid waste. In the entire tract there was not an American nor any property belonging to an American that was not destroyed. Altho cattle stealing was the original object of the raids, the lawless bands were soon engaged in general robbery and slaughter.

Conditions changed, however, as soon as Captain L. H. McNally and his company of Rangers were sent down there to run down the outlaws. It was a fight to the death when he and his men got within shooting distance of the Mexican thieves, and the Rangers won out.

The Rangers have neither tents nor chuck wagon to hinder their movements, but only a blanket under which to sleep, and a small sack or two in which to carry their commissary supplies. When trouble comes it is only a few minutes before they are headed across the trailless country for the center of action.

Our New British Ambassador

James Bryce's successor as British Ambassador to the United States reached New York on his way to Washington on April 28. The new Ambassador is Sir Cecil Arthur Spring-Rice, and he comes to us from Stockholm, where he has served as Envoy Extraordinary and Minister Plenipotentiary since 1908.

Sir Cecil's presence at Stockholm during the Olympic games of 1912 gave him a safe subject for discussion when interviewed at New York. He proved his diplomacy by his praise of the American team, and the methods of training which helped to win its prizes. "The Swedes were astonished," he said. "They had looked upon Americans as persons who go at things in a dashing, haphazard way, and the system and management of your athletes fairly took their breath. It was a new idea to all of us, this military discipline, the bringing over of the whole team in one ship, and keeping a close watch on them. The results proved the efficacy of this strictness."

The new British Ambassador has visited the United States fourteen times. He understands baseball. He hopes to see the boat-races at Poughkeepsie and New London. When his interviewers named Scutari or the Clayton-Bulwer treaty or the Krupps he took refuge behind his interest in sport —which exprest itself years ago when he rowed at Balliol College, Oxford.

Sir Cecil's title was conferred upon him in 1906. He was born in 1859. His public service has included the tenure of clerkships in the War and Foreign Offices. His diplomatic posts have included secretaryships at Brussels, Washington (under Lord Sackville), Tokyo, Berlin and Constantinople. He has served as Chargé d'Affaires at Teheran, British Commissioner of the Public Debt at Cairo, First Secretary of Embassy at St. Petersburg, and Minister and Consul-General to Persia.

Copyright, Brown Bros.

SIR CECIL ARTHUR SPRING-RICE
Mr. Bryce's successor is a lover of sport.

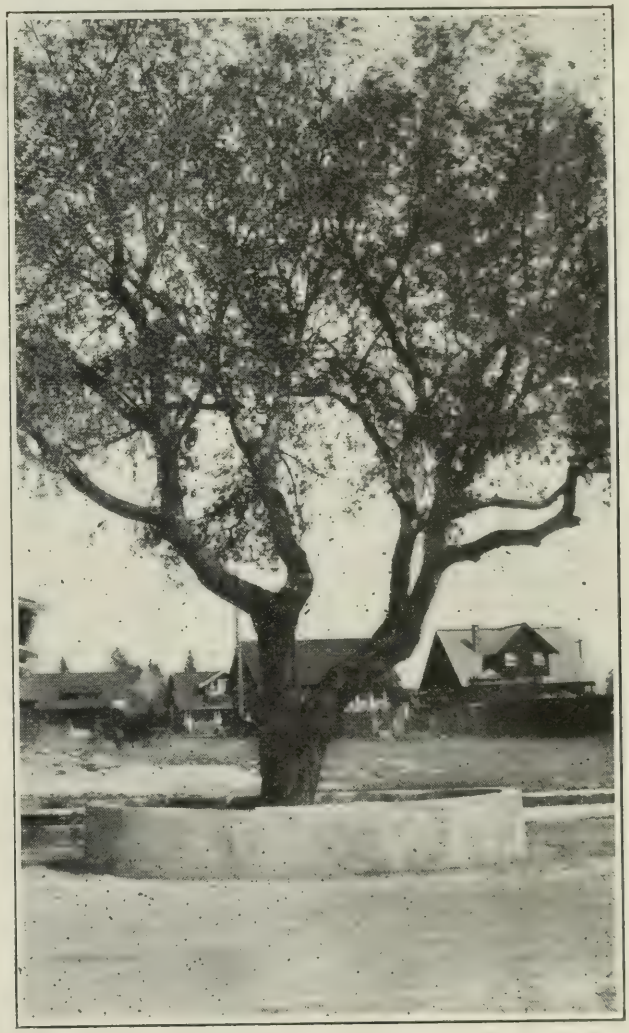
A Swedish Bayreuth in Kansas

Under this title in the current *American-Scandinavian Review*, Ernest Frederick Pihlblad, president of Bethany College, claims that Lindsborg, Kansas, a hamlet of scarcely two thousand souls, is the musical center of the southwest.

Lindsborg is the center of a Swedish colony covering some forty square miles. Its only boast above the neighboring Kansas towns is the presence of Bethany College and the annual musical festivals.

While waging an unremitting fight for sustenance and material prosperity, the sturdy Swedish families of the town have found time to cultivate the higher forms of musical art, until now they have made their town a musical Mecca whither the devotees of the divine art for hundreds of miles about are accustomed to make a pilgrimage to attend the annual festivals. Each Easter Week for more than thirty years Handel's "Messiah" has been given with a chorus of 500 and an orchestra of forty pieces. With the exception of the soloists, who are stars of the first magnitude, imported for the occasion, it is entirely a home affair. Many of its members participated in the first performance, and from the bass section more than one grandfather hears the voices of his daughter or granddaughter singing among the sopranos or altos. One of the unique features is a children's chorus of 300, membership in which is a distinction to which every boy and girl in the community aspires. The repertory of the chorus has now been expanded to include all the standard oratorios.

"The Messiah" is given three times each season—Palm Sunday, Good Friday and Easter Sunday. Each afternoon and evening of the week are given over to musical entertainments by the visiting artists. On the "Messiah" days the railroads run special trains to Lindsborg; this spring a single train brought over 1200 people.



The whole undertaking has about it something of the old-world atmosphere of simplicity bordering on the severely primitive. There is no applause during the program, which lasts about three hours, and the atmosphere is rather that of a religious service than of a concert hall.

The musical critic of the *Chicago Tribune* describes the singing of the chorus as follows: "It attains a tone of surprising unity, and in all matters of rhythmical and intervallic precision it is unsurpassed. The quality of the tone is beautiful. . . . But it is a spiritual attribute rather than that of mere tone and technic that distinguishes the performance of the Lindsborg chorus, as compared with the choruses of larger cities."

The credit for the existence of the Bethany Oratorio Society is due Dr. Carl Swensson, who in 1879 came to Lindsborg, fresh from college, to be pastor of the church.

Fortifying a Tree

Out in Glendale, California, they believe not only in keeping fine trees, but in insuring them against injury. When the land around the tree shown in our illustration went the way of all real-estate developments and was cut up into building lots, the tree was left in the middle of a street.

AN "ISLE OF SAFETY" FOR A TREE

Shade was none too plentiful—it's not one of the "all modern improvements" that you can buy for so much down and so much per month—and the tree was too good to lose. So it was left unmolested, and a protecting wall of concrete was placed around it by the town officials.

The Land of Roses

To think of the Balkan region at the present time in connection with anything but war is difficult. Yet the mountain regions of Bulgaria are renowned for an industry so full of beauty and peacefulness

BULGARIAN GIRLS GATHERING ROSES
Poetry and prices are both on a high level in this industry.

that the simple peasant folk engaged in it would seem to have no place in their hearts for thoughts of war.

From out of this wild mountain country comes the world's principal supply of that expensive luxury known as attar or otto of roses, or simply, rose oil, obtained by distillation of the flowers. An ounce costs at wholesale from $12 to $16.

Bulgaria has been renowned as a rose oil district since early in the seventeenth century. A sheltered situation protects the roses from weather extremes; heavy dews, overcast skies and showers at flowering time favorably affect the oil content; plenty of timber is available for firing the stills, and many streams furnish water for cooling the condensing pipes.

The famous rose district extends along the southern slope of the Balkan Mountains. Its average length is about eighty miles, its width some thirty. The rose gardens cover about 18,000 acres, scattered thru 150 villages, with the districts of Karlovo and Kazanlik in the lead in production.

The damask rose (*Rosa damascena*) of the old-fashioned garden is the kind generally cultivated in Bulgaria for the oil. White roses, yielding an inferior grade, are occasionally seen. A rose garden will produce flowers for about twenty years, but only one crop is obtained in a year.

The gathering of the roses is done mostly by women and young girls. Long before the sun rises, in May or early June, these peasant girls, clad in their bright-colored native costumes, are at work. For miles around the air is heavy with the fragrance, and as far as the eye can reach are thousands of closely grown rose hedges, about the hight of a man. The gathering must be done early in the morning, while the half-opened buds are still wet with dew.

The roses are broken off just below the calyx. A sticky waxlike substance from these calyxes clings to the hands of the girls plucking the roses, and this is scraped off from time to time, to be made up later into a salve that is claimed to be good for sore eyes; it is also used for perfuming tobacco, and for coating metal necklaces.

No wonder the oil is so expensive—about 200 pounds of roses yield a single ounce of the oil. Under the most favorable conditions an acre may produce from 4000 to 4500 pounds of roses; about 300 blossoms to the pound.

As soon as they are gathered, the roses are carried to the distillery, spread out in a cool, shady place and distilled during the same day. Some of the larger establishments have modern equipment, but for the most part the process is carried on in the primitive fashion known to the peasants for ages; most frequently the distillery is merely a covered shed, open in front, under which the apparatus is placed. The rose water obtained from the first distillation is distilled a second time. Floating upon its

PRIMITIVE ROSE OIL STILLS

surface are numerous tiny yellow oil globules—the attar of roses. When all the oil globules (called "butter" by the Bulgar) have come to the surface, they are skimmed off with a queer little conical spoon having a very fine opening thru which the water can run out, but not the oil.

Needless to say, attar of roses, because of its high price, is much subject to adulteration. An attractive souvenir bought at the foreign bazars is in the form of an oblong crystal flask holding about ten or fifteen drops of what may or may not be oil of rose. Sometimes the only oil of rose present consists in a dab of the precious oil on the skin covering the crystal stopper.

ALICE HENKEL.

THE WEEK

California and Japan

In California's Legislature a bill designed to prevent ownership of land by Japanese was passed on the 3d, the vote being 36 to 2 in the Senate and 72 to 3 in the House. This was not the bill which was under consideration when Secretary Bryan arrived at Sacramento. For that bill another had been substituted, but the substitute is not less objectionable to Japan. On the 4th, the Japanese Government instructed its Ambassador at Washington to make formal protest. Unofficial dispatches say that Japan holds our national Government responsible and expects that it will find some satisfactory solution of the problem.

Just before the passage of the bill an amendment was adopted, permitting those ineligible to citizenship to lease land for three years. This provision practically permits continous leases, for at the expiration of the term a Japanese lessee may shift the lease to another representative of his race. But it is admitted that the amendment was adopted in the interest of owners of large tracts of land, who would suffer loss if they were forbidden to lease to Japanese. After the passage of the bill, Governor Johnson said: "We have accomplisht the big thing. We have prevented the Japanese from driving the root of their civilization deep into California soil. The three-years' clause was planned in the interest of our own people, to give them time to adjust their affairs to the new conditions. The big thing we set out to do we have done without swerving."

Mr. Bryan had several conferences with the members of the Legislature in joint secret session. He urged delay, suggesting several ways in which delay could be caused. There might be an investigation by commission, or a referendum. Evidently he realized that the Legislature and the state's executive officers had determined to prevent the ownership of land by Japanese. His arguments and his presentation of the views and advice of Mr. Wilson had no effect. The President sent a warning that passage of the bill would involve appeal to the courts and long and delicate litigation. Governor Johnson and his Attorney General said they could not see how such an appeal could be avoided and that any language defining the purpose of the legislation would be open to the objections raised by Mr. Bryan and the President.

In the Federal District Court at Spokane, Wash., on the 3d, Akhay Mozumbos, a Hindoo, born in Calcutta, was made an American citizen, altho court decisions heretofore have excluded Hindoos. The applicant asserted that his caste was of Caucasian origin, and was supported in this by Judge Rudkin.

The Tariff Bill

General debate on the tariff bill ended in the House on the 27th ult., and the provisions of the measure were then taken up under the five-minute rule. As the debate proceeded there was abundant evidence that no changes would be permitted except verbal alterations proposed by the ways and Means Committee. Schedule after schedule was adopted without difficulty. On the sugar paragraphs the vote was 186 to 88. There was Democratic opposition, of course, from Louisiana, and in a protest from Hawaii it was asserted that the sugar industry there would be ruined and the island turned over to Asiatics. The vote on the wool and woolens schedule was 193 to 74. Mr. Dies, Democrat, of Texas, opposing free wool, predicted that this legislation would defeat the party in the next election. Mr. Murdock, leader of the Progressives, will demand a vote on the creation of a Tariff Commission.

President Wilson gave a hearing to six Senators— Messrs. Newlands, of Nevada; Chamberlain and Lane, of Oregon; Thompson and Shafroth, of Colorado, and Walsh, of Montana—who object to the provisions of the sugar and wool schedules. The conference consumed three hours, and at the end of it the statement was made that Mr. Wilson's support of the proposed legislation had not been shaken. There will be an almost even division in the Senate, and it is predicted that the debate there will continue for two months. Great Britain asserts that the proposed concession of 5 per cent for imports carried in American ships is forbidden by existing treaties. For this reason the commission may be omitted.

The Fourth Peace Congress

The fourth American Peace Congress was held in St. Louis last week, and the leading figure at the meeting was Mr. Carnegie, who made a long address on the first day of the session. In the course of this he predicted that President Wilson and his Administration would win great glory by successful work in the interest of world peace. We refer elsewhere to the argument of Mr. Fairbanks, formerly Vice-President, on the question of Panama tolls. Resolutions urging repeal of the toll exemption, approving the Taft peace treaties, urging the President to open negotiations for a reduction of armaments, and opposing "the insidious effort to extend military training in the schools," were among those adopted.

At the annual meeting of the American Peace Society, held in connection with the Congress, Dr. Lyman Abbott was removed from the list of vice-presidents, on the motion of the secretary of the Chicago Peace Society, because he had signed, it was asserted, the appeal of the Navy League for large naval appropriations.

Railroads in Alaska

Testifying before a Senate committee, last week, J. E. Ballaine, of Seattle, said that when he sought financial support, in 1908, for a projected railroad in Alaska, he was told by George W. Perkins (then associated with J. P. Morgan & Co.), that the Guggenheim interests would not permit any railway development of Alaska's resources until their pending claims to coal properties were approved under Government patents.

Mr. Perkins will be asked to come before the committee, which is considering a bill authorizing an issue of $35,000,000 of bonds for the construction of railroads, to be operated under Government control, from tidewater or existing lines to the great coal fields.

The Panama Canal

By a vote of 13 to 1 the Senate committee on canals has decided that consideration of the exemption of our coastwise shipping from Panama Canal tolls must go over to the regular session in December. There will be no action, therefore, at the present session unless the President asks for it. At the Peace Congress in St. Louis, last week, Mr. Fairbanks, formerly Vice-President, made an address in which he said that our national honor required repeal of the exemption or consent to a settlement of the dispute by arbitration. Professor Reinsch, of the University of Wisconsin, asserted that nothing would more distinctly weaken American leadership of the peace movement than a refusal to accept arbitration or to reach a satisfactory agreement with Great Britain in some other way.

Philippe Bunau-Varilla, formerly chief engineer of the Canal, has written a book in which he urges the United States to begin at once to make a sea-level canal. The lock canal, he says, will not be workable twenty-five years hence. The change should be made because of the increasing size of ships, the menace of disaster at the Gatun Dam, a possible lack of water for the locks and the coming growth of traffic.

Unfortunate Mexico

The revolt in northern Mexico continued to gain territory and strength, last week, except at Guaymas, where the Federal garrison was reinforced by 2000 men who came from the south by sea. Because of rebel successes, 2500 miles of the national railways, are out of commission. Carranza's followers captured Vanegas, in San Luis Potosi, and Matehuala, in the same state. In the latter town they destroyed thirty-three buildings with dynamite and killed the Federal garrison of ninety men. When they captured Santa Rosalia (in Chihuahua) they put to death all the Federal officers there. It was reported that General Trucy Aubert, in Nueva Leon, and General Rabugo, in Chihuahua, had turned from Huerta to Carranza. This was afterward denied, and it was said that Aubert had been recalled to the capital because his service was unsatisfactory. General Salazar, who had led 600 Maderists to Huerta's support, lost two-thirds of his force by revolt, the deserters joining Pancho Villa, the bandit rebel commander. Salazar himself was said to be a prisoner.

Carranza undertook to negotiate a forced loan of $2,500,000 by the issue of paper. It was provided that those who refused this paper should be sent to jail. Therefore many merchants closed their shops. Carranza also increased the local taxes by 20 per cent. In the south Zapata still defied the Government, altho his men were defeated in one battle. Zapatists with dynamite wrecked a train on the Interoceanic road near La Cascade, and fell upon those who survived, slaughtering even the unarmed. They killed 120 persons, including the members of a military escort. Rebels captured four towns in Zacatecas.

There were rumors that Diaz and Huerta had fallen out, and that soon there would be war between them. Diaz, it was said, was collecting his forces at his country

place, thirty miles from the capital. He said to the press, however, that he would never attack the present Government or violate his pact with Huerta. The latter has undertaken to procure a general election on October 26. He denied a report that plans for a sale of Lower California to Americans for $25,000,000 had been completed.

In New York, Mercedes Madero, sister of the late President, was married on the 1st to Señor Antonio Canalizo, formerly a member of Congress from Lower California. The widow of Vice-President Suarez, left in poverty with six young children, appealed to the Masonic order for help. Señor Fuentes, recently Maderist Governor of Aguas Calientes, and one of the imprisoned governors whom Zapeda, Huerta's nephew, attempted to kill, has escaped to Cuba. Great Britain has formally recognized the Huerta Government.

Other Countries South of Us

It was reported, last week, that Great Britain had addressed to Guatemala an ultimatum concerning the payment of that country's foreign debt, and that Guatemala had appealed to our Government for help. The debt amounts to about $10,000,000, and no interest has been paid for several years. Some time ago Guatemala began negotiations for a loan of about $20,000,000, to pay the old debt and to reform the republic's currency, but the negotiations came to nothing. Great Britain says that no ultimatum was sent, but that an urgent demand for payment was renewed. Some think there was an attempt to test the Wilson Government's attitude toward questions of this kind. At a dinner given in his honor by the directors of the Panama-Pacific International Exposition, in San Francisco, on the 1st, Secretary Bryan said: "I glory that we now have an Administration which will bring home to the republics of South America our sense of national honor, and which will herald to them our abandonment of dollar diplomacy."

Hayti's president, Tancrede Auguste, is dead. In August last he succeeded President Leconte, who was killed by the explosion of powder stored in the palace. It is expected that Congress will elect General Bellard.

The amnesty bill passed in Cuba is to be examined carefully at Washington. One that preceded it was vetoed after it had been opposed by Secretary Bryan. Cuba's prisons are crowded with political offenders. Our Government does not object to the release of these.

There has been much disorder in Rosario, Argentina, where a general strike was proclaimed. Shops were closed, and the residences of the city councillors were attacked. Troops fired upon the strikers, killing one of them. A settlement was reached on the 1st, and accepted by all except the street railway men. In Buenos Ayres 4000 taxicab chauffeurs have gone on strike against new municipal regulations.

The Philippine Islands

Major Finley, governor for several years past of that part of the archipelago in which the Mohammedan Moros live, won their respect and confidence. We referred last week to his visit to the Sultan of Turkey. It now appears that the Moros, on his departure, gave him a signet ring, and asked him to urge the Sultan to send to them Mohammedan teachers. He assured the Sultan, it is said, that such teachers would be welcomed. The Sultan was asked to tell them that the teachings of the Koran did not permit them to kill Christians. The Major also sought the Sultan's influence to restrain the Moros from using alcoholic liquors. It is understood that, returning, he bears a letter from the Sultan urging the Moros (who regard him as their religious chief) to obey the laws of the United States, to send their children to school and to learn the ways of the civilized Americans who rule over them.

In the last half of 1912 the foreign trade of the islands amounted to $61,099,878, against $48,529,117 in the corresponding half of 1911.

British Militants

A suffrage demonstration on May 4, at which 30,000 persons assisted, came near to ending in a riot when the police interfered. This occurred in Trafalgar square, London. Incendiaries, supposed to be suffragets, set fire to two London timber yards on the same day, and on May 3 burned the sheds of the Midland Railway at Bradford, England, destroying property valued at $500,000. On May 3, also, a bottle containing nitro-glycerine was discovered at Piccadilly Circus, London, on the same day, and attributed to the militants. Six of the latter were arraigned at the Bow street police court on evidence consisting of letters seemingly referring to the manufacture of bombs, sending in false fire alarms and burning seven London lumber yards, etc. These letters were among the documents seized by the police at the headquarters of the Women's Social and Political Union in Kingsway, raided April 30.

The weekly organ of this, the militant organization, was suppressed, on the ground that it has directly advocated criminal attacks upon property. It is thought that the militant organ—*The Suffragette*—will now be issued from Paris, where one of Mrs. Pankhurst's daughters is residing. Mrs. Pankhurst herself was recently removed to a nursing home, where she is under police surveillance. The London press gravely announces the discovery of a plan to remove the leader by aeroplane, and waft her over the British Channel. "Several prominent airmen have been requested to undertake this criminal enterprise," says the *Standard*. The women continue to make war on sport, burning boat-houses, etc. A plot to burn the hangars, etc., of the military flying school on the upper Avon has, it is said, been frustrated.

Suffragets express themselves variously in condemnation of the Government's "barbarity" and in praise of the Government "playing into our hands splendidly" by its increased vigilance and energy of action. Male suffragists denounce the Government for its responsibility for forcibly feeding one of their number, named Franklin, who was recently released from jail, 114 times. Israel Zangwill, the author, declares that Englishmen live "under a regime of bullies and sharpers." The Government threatens to make persons who contribute money to the militant cause responsible for the way their money is spent. The House of Commons has voted the "cat and mouse bill" introduced by Home Secretary McKenna. This bill provides for the temporary conditional discharge of prisoners whose detention is undesirable on account of their condition of health. Prisoners discharged in this way will have to return to prison on the expiration of the period specified in the order of release, or will be liable to arrest without a warrant. Numerous amendments were proposed but all were opposed by the Government and rejected or withdrawn. The first clause was adopted by a vote of 208 to 30.

Belgium and the General Strike

The recently terminated general strike in Belgium is discussed on pages 1034-1037 of this issue of THE INDEPENDENT. Cable dispatches give its cost to the nation and its industries as $20,000,000. The Brussels correspondent of the Paris *Temps* quotes a manufacturer as estimating its daily cost at two million dollars. Just as the strike closed, the Exposition of Ghent was formally opened by King Albert—on April 26. France makes a better showing in the exposition than any other country. The American Congress appropriated $25,000 to promote exhibits of products of the United States.

To take the place of the Belgian newspapers crippled by the strike, the Central Committee of the General Strike issued a special journal set up and printed in the printing establishment of a Socialist organ published at Lille, the *Réveil du Nord*—"Tocsin of the North." This newspaper was called *Bulletin of the General Strike*, and was sold for one cent. Editorially, it was stated that this sheet was "neither Socialist, Liberal, nor Catholic: but the weapon of all those who, at the moment, are fighting for equality, and justice. . . . It will be the vade-mecum of all the combatants in this formidable and pacific proletarian crusade." One of the contributors to the strikers' fund was Maurice Maeterlinck, whose "modest obol" (as he called it) was a check for two hundred dollars.

While the strike was in progress, Paul Janson, leader of the Radicals, and a deputy representing Brussels, died after a two-years' illness. Janson was born in 1840, and was the grandson of a distinguisht Parisian lawyer who fought in the armies of the first French Republic and settled in Belgium after the fall of the First Empire. A Republican in ideal, Deputy Janson was probably the most popular leader of the Belgian Democrats. He worked in sympathy with the Socialists whenever it was possible for his party to stand on common ground or work for common ends—such as the universal suffrage. An orderly demonstration was made at his funeral by the strikers, thousands of whom paid his remains honor as they were borne to the railway train that was to convey them to Paris for cremation.

Germany and Her Military

The German Army bill was amended by the Budget Committee of the Reichstag on April 30 when three additional cavalry regiments were voted, instead of the six regiments proposed. The vote was 16 to 12. On the 29th the most important features of the new bill were voted.

The German Crown-Prince, Frederick-William, signs the preface to a chauvinistic book entitled *Germany in Arms*, of which he is reported to be the author. He declares in the preface that diplomacy may delay and occasionally avert conflicts, but "the sword will remain the final and decisive factor until the world's end." In another passage he says: "Only with the support of our good sword can we maintain that place in

the sun which is due to us, but which is not willingly accorded to us."

The author of *Germany in Arms* points out Germany's unfortunate geographical position, and warns his countrymen that the German army and navy must be kept continually at the highest point of efficiency. He says that commercialism threatens to destroy the old ideals, since for the undisturbed earning of money one needs peace at any price. "History shows that the nations in which commercial interests have decided their policy have ended ingloriously."

The Crown-Prince is declared by Dr. Liebnecht, the Socialist deputy, to be the leader of a secret organization of army officers engaged in war-baiting. Dr. Liebnecht, who made public the Krupp scandal, now charges that the Vickers-Armstrong firm in England was the originator of the Boer War; that the French armament interests, particularly Schneider and Creuzot, in conjunction with certain banks, have carried on criminal politics in the Balkans, and that German cannon and arms industries sell German arms and weapons to every one so that German soldiers may be murdered with them. The Socialist scored the business morals of the Krupps and declared that among all the armament firms there was none which worked so extensively and systematically with other than ethical means as the Krupps. Moreover, the *Batille Syndicaliste* is endeavoring to connect the German Emperor with the scandal, representing him as one of the largest shareholders in the Krupp corporation.

Switzerland and the Gothard

By a vote of 108 to 77, the Swiss National Council has ratified what is known as the "Gothard Convention." It has done this in the face of widespread and almost violent opposition. Never since the adoption of the federal constitution in 1872 has the nation been so deeply moved. The event strikingly illustrates how economic interests may conflict with patriotism. The most pronounced opposition to the ratification of the treaty came from French Switzerland, altho the ablest speech of the minority was made by Frey, a deputy of Zürich. When a *Landsgemeinde*, or popular meeting, was held at Berne to protest against the proposed arrangement, special trains brought people to the capital from all quarters. A protest with 125,000 signatures had been presented to the government, and the mass meeting was attended by 100,000 voters.

When, in 1869, it was decided to make the St. Gothard tunnel thru the Alps, in order to give direct transit by rail from Germany to Italy, a subsidy of thirty million francs was granted by Germany, and one of fifty-five millions by Italy. In financing the work, these countries demanded that for traffic privileges they should be treated as "the most favored nation." In case the dividend of the railway exceeded 7 per cent, half of the surplus was to go to the subsidizing states. Even at that time the international arrangement awakened opposition in Switzerland. Fears were entertained that neutrality and independence were threatened. And since then the commerce of the tunnel has proved far more advantageous to Germany and Italy than to Switzerland.

In 1897, the ownership of all the Swiss railways, including the St. Gothard line, passed into the hands of the government. Germany at once objected to the purchase of the tunnel, contending that as one of the subsidizing nations it had the right of veto. With Italy, as a result of this resistance, it gained important concessions. Both countries obtained the treatment of "the most favored nation," not only on the Gothard line but on all the Swiss railways; and the Federation, with almost incredible generosity, permitted the Germans to compete with the Swiss for the electrization of the Gothard system, and for furnishing materials in making the improvement. In the Reichstag, the German Chancellor boasted of his success in the negotiations. Italy was less pleased; for it was not difficult to foresee the flooding of the markets of the peninsula with German importations. The arrangement was, of course, badly received at Vienna and Paris. After three years of delay Switzerland has surrendered to Germany and Italy, and has ratified the convention. In so doing, it has to a considerable extent abdicated its economic sovereignty. It has been pointed out by opponents of the convention, that Germany remains free, in the event of a tariff war, to stop all Swiss exportations over the line, by raising the rates; while Germany would continue to send her own products into Switzerland without let or hindrance. It was perhaps more immediately profitable from a financial point of view for the Swiss Government thus to surrender. To have done otherwise would have entailed economic sacrifices, and Switzerland is poor. The Federal Government has, apparently, set economy above patriotism and political independence.

In the Paris *Temps* a well-informed writer compares the economic situation of Switzerland with that of Servia; and in a recent number of THE INDEPENDENT Mr. Tsanoff shows how the latter country is in danger of becoming an economic vassal of the dual monarchy. When, in order to force

Servia to come under the yoke, Austria closed its frontier, the Belgrade Government lowered its railway rates and made its exportations not thru Vienna but by the Black Sea. If Servia and Bulgaria had been bound by such an agreement as Switzerland has made with Germany, they would have been helpless to defend themselves.

The course of events in the settlement of this Gothard convention is thought to support the idea that the Pangermanists have designs upon the northern cantons of the Swiss Federation. No doubt the German Swiss are quite as loyal as those of Ticino, Neuchâtel, Vaud and Geneva; but there are many, particularly in the powerful Socialist party, who are disposed to ridicule national boundaries. A member of the Federal Council (the executive branch of the Government) said, not long ago, that it was a matter of indifference to him whether the French and Germans crossed the frontier and took possession of his country, or not.

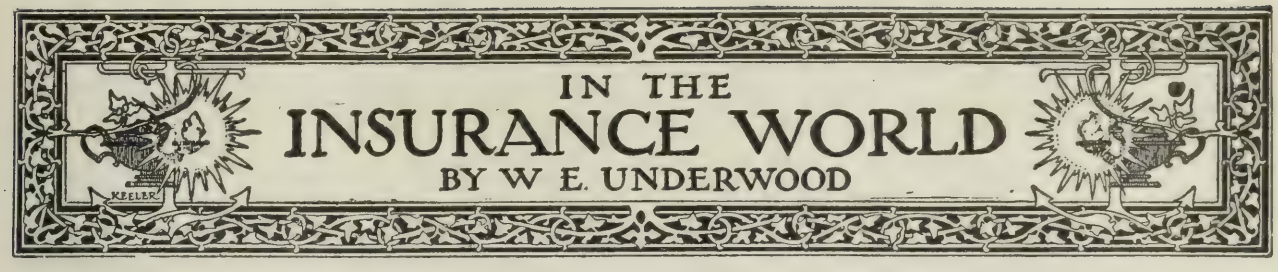
In the Swiss schools the story of William Tell is now regarded as a legend. It is hard to believe that the patriotism which has always been the pride of the little nation is to become a fiction.

The Inflammable Balkans

At a war council held at Cettinje, the capital of Montenegro, on May 3, King Nicholas and his generals decided to yield to the Powers and evacuate Scutari. The matter would be laid before the Montenegrin Parliament on May 8, it was announced. The Cabinet has resigned.

On May 3, also, Italy and Austria were reported to have signed a secret treaty relative to the occupation and partition of Albania, involving military operations. Essad Pasha, the Turko-Albanian defender of Scutari, after surrendering the city to King Nicholas of Montenegro, declared himself Emir of Albania and had himself installed by the Greek Metropolitan of Durazzo, under the suzerainty of Turkey. Anarchy has prevailed in many sections of Southern Albania, the soldiers of this commander and of Djavid Pasha looting and slaying the inhabitants.

Austria continues to make preparations for war, and to mass her troops near the Montenegrin frontier. The Austrian Government has been dissatisfied with the failure of the ambassadorial conference at London to initiate decisive action. All the Powers agree that Scutari must be evacuated. The difficulty is to reconcile their different views as to the method by which evacuation can be obtained.



China

On May 2 the American chargé d'affaires at Peking presented a formal recognition of the Chinese Republic by the United States. Troops lined the streets between the American Legation and the Winter Palace while Edward T. Williams, representing our Legation, drove by in a presidential carriage with an escort of Chinese troops on his way to present President Wilson's message to President Yuan. In thanking President Wilson, Yuan Shi-kai cabled that the former's "expression of greeting and welcome at once testifies to the American spirit of mutual helpfulness and adds another brilliant page to the history of seventy years' uninterrupted friendly intercourse between China and the United States." (This subject is discussed editorially on page 1009.) Mexico also recognized the Chinese Republic on May 2.

Somewhat earlier, on April 29, the Foreign Office at Peking formally notified the legations of the Five-Power group with which the $125,000,000 loan had just been concluded that the Chinese Government accepted responsibility for the loan. This matter was discussed in the Chinese Senate in the presence of 151 of the 274 senators. One hundred and two of the senators present supported a resolution to cancel the loan.

This action represented the opinion of the Kuo Min-tang, the political party dominant in South China.

While there is no break between Provisional President Yuan Shi-kai and the National Assembly, yet reports appear of serious differences. He is credited with demanding that the constitution shall give him the power of creating his Cabinet, as in this country, thus assuring more permanence of administration, while a large part, if not a majority, of the Assembly desire the Cabinet to be responsible to it as in Great Britain and France, and not to the President. This is said to be the position taken by Dr. Sun, the first Provisional President. Indeed one of the reports credits him with planning a revolt against Yuan, but this is incredible. That would involve the division of the Empire into North China and South China. Other demands made by President Yuan, or credited to him, are the right to dissolve the National Assembly, to issue emergency ordinances, as in Japan, and to take extraordinary financial measures. The Republican and Unionist parties in the Assembly have supported Yuan, while the Nationalists are headed by Dr. Sun and leaders of the Kuo Min-tang party.

Life Insurance Taxation

A tax on any interest of any life insurance policyholder is indefensible. It closely approximates a tribute laid upon a cemetery lot. To the vast majority of men a life insurance premium is a sacrifice; in varying degrees it represents extra effort or self-denial. It is a burden, one upon which the unwisdom of legislation lays another burden. This mistake is due to ignorance, to a confusion of ideas. Men are often misled by names, missing the nature of the things the names represent. It is fairly probable that life insurance accumulations would be exempted from taxation if from the beginning they had been called burial funds, or widows' and orphans' funds, or old-age pension funds. That is exactly what they are.

There is prevalent, even among policyholders, an erroneous idea respecting the nature of the vast accumulations held by the combined companies. They carelessly look upon them as great aggregations of surplus wealth. This comes from the fact that they are concentrated and the amount is exceedingly large. And yet, in the usual meaning of the terms they are neither wealth nor surplus. They are, every dollar of them, expense funds—small contributions of hard-earned money, saved up against the time when the universal enemy shall desolate the households of the contributors. Not a penny of the money dedicated to such use should be seized by government.

Sometimes those of us who argue this way are confronted by the word "dividend." The advocates of this form of taxation tell us that there is evidently a profit in the business because there are dividends and, at the maturity of policies written for a specific term, or which may be surrendered then, cash values which often exceed the total of all premiums paid, leaving out of the reckoning the protection enjoyed in the interim. But this is fallacious.

The word dividend as used in life insurance represents no earnings by the premium of the policyholder. It is but an unused portion of the premium which, for the sake of safety, is made larger than necessary. It is a return premium, an unearned premium. These so-called dividends when accumulated for years, added to the reserves which all level premium companies must maintain, constitute the cash surrender values, which in individual cases sometimes exceed the total premiums paid. But that doesn't prove that those policyholders have made any money. They have paid their full share of all the death claims incurred while they were in the company and of all the expenses. That certainly represents money they contributed. In addition to this, all the unused money they paid in earned interest. Even in these exceptional cases the appearance of a profit is deceptive.

Let us briefly consider an average instance: A man at forty takes $1000 of ordinary life insurance at an annual premium of $30.94, and keeps it twenty years. His total premiums during that time will be $618.80. We will assume that his so-called dividends for the whole time will equal twenty per cent of the premiums, amounting to $123.76. The cash surrender value on that policy at the end of twenty years is $383.47. This amount, added to the dividend brings the total return to $507.23. He is, therefore, "out" $111.57, plus the interest on $30.94 (the premium) per year at, say the legal rate in New York, six per cent, compounded, which amounts to $1,206.44. So we see that this man's whole investment was worth $699.21 more than he received from it, leaving the protection against his death out of the reckoning, and that sum represents the actual expense incurred.

The case is plain. There is no money to do anything with in a life insurance company that does not come from its policyholders. There are no other sources from which it can be obtained except from interest, and that is earned by the money furnished by them. There are death claims and expenses. Who pays these?

We return to our first statement: Life insurance is an expense to those who carry it and never a source of financial profit and all the money of all the life insurance companies is but an expense fund—burial, widows' and orphans', old-age pension fund. Call it what you please, but don't overlook its actual character. It is plain that it should not be burdened with taxation of

any kind, either by the states on premiums or by the Federal Government as a species of income.

The Fire Insurance Trust

There can never be a fire insurance trust. This may not sound pleasant to those who believe there is one and that it is the duty of every public spirited citizen, newspaper and magazine to smash it. If such a monopoly did actually exist we would contribute our share to its undoing.

We know that a very large number of intelligent people in this country sincerely believe that the leading fire insurance companies are confederated together for the purpose of imposing their own conditions on buyers of this form of protection, their principal object being to secure inordinate profits for themselves. If the thing traded in possessed a material character, if it were a natural or manufactured product, the supply of which could be controlled, there would be some foundation for the belief in monopoly. The answer to this is that there are associations among these companies, which make rules of practice and premium rates and that they agree to maintain these—that they will not depart from the practices prescribed nor cut the rates. Therefore, the service they are prepared to render is granted or withheld as purchasers comply with or reject the conditions imposed by the organization, and that the thing in which the monopoly exists is service. The existence of the associations for the purposes stated is admitted, but taking the business as a whole for a number of years we will fail to find the exorbitant profits a trust would be certain to yield its membership.

Keeping in mind the idea that these associated efforts are, or should be, directed solely at the acquisition of unreasonable profits, we are confronted with two interesting questions: First, why are the actual profits made during a sufficiently long period to furnish a reliable average, say ten years, so meagre? and, second, Why are capitalists generally, large and small, so indifferent to a business that is capable of producing such rich results? If desirable to do so, it would not be difficult to organize and embark in business one hundred new fire insurance companies in the city of New York within sixty days. Five hundred could be started in the United States within that time. If it were the lucrative business the believers in a fire insurance trust think it is, capitalists would seek it, the number of companies would rapidly multiply, the new organizations would compete with the older ones and the trust would have its backbone broken. It is because new companies can be organized easily and are not, that we entertain no belief in the existence of a trust. When there is one, its existence will be made manifest by a large number of new companies, seeking good profits, at lower rates, on money which is always eager for substantial returns.

As a past worker and a constant student of the fire insurance business, we understand the necessity for uniform rates and practices. The terms of nearly all the policies used are prescribed by one state or another, most of the forms being those of New York, Massachusetts and Pennsylvania. Uniform practices are requisite to the interests of the assured, principally, because as a general thing a risk is covered by more than one company, and in order to make proper settlements of claims the written portions of the various policies should be concurrent—that is, exactly alike. It is also essential to the correct transaction of the business that the rules governing the conduct of a large number of agents, all representing from one to twenty companies each, should conform to one standard. It is more difficult to explain to the "lay" mind the reason for uniform rates. Fire insurance rating should be scientific, but it is not. The nature of the thing seems to defy accurate analysis. Life insurance has attained this state of perfection because the contingency insured against is sure to occur. All men must die. But all buildings will not burn; the vast majority will not. So the companies are forced to take the law of average for a guide. This they do, the average changing constantly. But that combined experience—the average total experience of all—is the only safe thing they can depend upon, and in many cases that fails. When it does, the weaker companies pass out and the stronger ones suffer a loss of surplus or invest more capital. But the uniform rate is the only anchor against disaster.

We have discussed this subject in an elementary sort of way principally for the purpose of illustrating the absurdity of the legislature and state officials of Missouri in compelling, thru an unnecessary statute, unjust and unwarranted in its terms and intentions, nearly two hundred companies to suspend business in that state. There is no such trust as the one they are warring against, and they have sacrificed the business interests of their people without cause. The real victims are the people of the state.

FINANCE & TRADE

Interest on Government Deposits

After June 1, those national banks which are Government depositaries, must pay interest at the rate of 2 per cent on the Government's money which they hold. The total amount deposited with these banks, according to the latest available report, is $42,649,964. There are deposits of $1,918,000 in ten banks of New York City. Secretary McAdoo's order, requiring the payment of interest, was accompanied by one which authorized a transfer of an additional $10,000,000 from the Treasury to the national bank depositaries, and by a concession concerning the bonds to be placed with the Treasurer as security. Hereafter this security is not to consist exclusively of United States bonds or the bonds of provincial Governments (for the full amount of the deposits), but 30 per cent of the deposits may be secured by "high-class state, city and county bonds, acceptable to the Secretary of the Treasury, at 75 per cent of their market value."

No interest was paid on Government deposits prior to 1908. Thereafter 1 per cent was paid, for a time, on certain special or inactive deposits, and the rate has since been increased to 2 per cent, but at the beginning of the present year the sum bearing interest was less than $1,000,000. Mr. McAdoo says that if 2 per cent had been required and paid since 1896, the interest to date would have been $30,610,881. If the deposits be now increased to $52,649,964, the annual interest yield will be a little more than $1,000,000.

It should be understood that the banks in which Government money has been placed have not gained any considerable profit on account of the deposits. The bonds required as security must be purchased at 102 or a higher price. In some instances they are borrowed or rented, for a charge ranging from ½ to 2 per cent. Moreover, an active Government account, especially in a large city, involves the cost of handling many thousand salary and pension checks. Four thousand were recently received by a New York bank in one day. It frequently happens, also, that the account is temporarily overdrawn. New York bankers say that, with 2 per cent interest required, the money must earn 4½ per cent to avoid a loss. It is expected that at least one of the ten designated depositaries in New York will give up its Government deposit because there will be no profit. But there is a demand elsewhere for the additional $10,000,000, all of which will easily be allotted. There is prestige as well as advertising in the name of a Government depositary and in the possession of Government funds. The concession with respect to the security will release Government bonds and these will probably be used for the issue of additional circulation.

Currency Reform

There is evidence that President Wilson earnestly desires that Congress at the present session shall at least begin the work of currency and banking reform. The House Committee on Banking and Currency will soon be appointed, with Representative Glass at the head of it. The Senate committee is already at work. It has prepared a long list of questions which are to be sent by mail to bankers, currency experts and economists thruout the country. A bill will be introduced after the passage of the tariff bill in the House.

There should be a beginning at the present session, even if the work cannot be finished before adjournment. Discussion of the subject upon the basis of a pending bill, will at least save time and hasten enactment at the regular session.

Bond Investment

Lawrence Chamberlain's *Principles of Bond Investment* (Holt, $5) is the most complete treatise on the subject that has as yet appeared. The scope of the work is much more extensive than is indicated by the title. In addition to the general principles of investment and detailed descriptions of all classes of funded obligations, there are chapters on gambling and speculation, on business forecasting, gold supply and prices and other matters of financial and economic interest.

The section of the book dealing with civil loans is the most complete. Mr. Chamberlain claims that "the conditions which

occasion municipal borrowing are sufficiently uniform to make correct generalization possible, whereas no generalizations equally broad are safe for the bonds of most private corporations, especailly of railroads. An unbiased analysis will find much to contradict this assertion. The history of public credit certainly does not confirm the statement that the credit of municipalities is not as subject to changes in management and in policies as the credit of railroads. The very fact that a number of states and municipalities have repudiated and compromised their indebtedness is proof that confidence in policy and management is at the basis of public as well as private credit. Mr. Chamberlain discusses in some detail the repudiation of state debts and concludes that "the ultimate cause of state repudiation is a low standard of business ethics."

Our author neglects to point out, however, that the best available means of preventing the survival of low business ethics in both public and private enterprise is to withhold financial assistance where it prevails.

Banking Reform

Two books dealing directly with the general question of banking reform in the United States have recently appeared. They are written for the same purpose, but from different standpoints. The aim is to emphasize the urgent need of change in the banking system. Prof. J. Laurence Laughlin, whose investigations in currency and finance entitle him to a high rank among monetary experts, upholds the ideal of banking reform as exhibited in the Aldrich plan. This provides for a national reserve association to be created under federal auspices by the banks of the country for the purpose of concentrating their cash reserves. Professor Laughlin, fully alive to popular prejudices against centralization in politics and in industry, denies that the National Reserve Association is similar to the central banks of European countries. He describes it as a co-operative institution, "like an enlarged clearing house association," but under Government supervision and regulation. Professor Laughlin's book (*Banking Reform*) is issued in Chicago by the National Citizens' League.

Mr. Ludwig Bendix, an authority on German banking, considers the European central bank the ideal modern banking institution, *The Aldrich Plan in the Light of Modern Banking*. (New York: Robert R. Johnston.) He admits, however, that the creation of such a bank in the United States "must be considered inexpedient." Changes in banking laws must be in harmony with political and economic conditions.

Since Professor Laughlin's book is written ostensibly as a "document" favoring the adoption of the Aldrich plan, adverse criticisms of the proposed measure naturally are absent. He exhibits the merits of the proposed banking reform over the present inadequate decentralized and inefficient banking system. His style is clear and simple, comprehensible to the ordinary untutored citizen. The chief merits of the Aldrich plan, according to Professor Laughlin, are: (1) Its prevention of money panics and (2) the establishment of a stable money market thru the creation of a rediscounting organization, viz., the National Reserve Association. Incidentally, the advantage of the so-called "acceptance" or commercial bill of exchange as a credit instrument superior to the prevailing promissory note is pointed out.

Mr. Bendix does not give his unqualified endorsement to the Aldrich plan, tho admitting that it is far superior to our prevailing banking system. He regards the measure as a compromise in that "it endeavors to maintain the characteristic development of the American system, namely, decentralized banking." His main criticism of the proposed organization of the National Reserve Association is the restriction of its business exclusively among the banks in the association. This provision prevents the activities of the National Reserve Association from becoming as far-reaching and as extensive as the activities of the European central banks, such as the Bank of England and the Imperial Bank of Germany. These have business relations with governments, with private banking concerns, and with individuals.

There is a great deal of merit in Mr. Bendix's criticism. The existence of banks as members of the National Reserve Association side by side with non-member institutions creates class distinctions and enmities. This is the outcome of the New York Clearing House restrictions, which were lately the object of the "Money Trust" investigation.

Financial Notes

The number of the depositors in our postal savings banks on March 31 was about 335,000, and their deposits, at 12,160 post offices, amounted to $33,500,000.

Owing to the northward movement of business in New York, the Central Trust Company, one of the largest institutions of its kind, has opened a branch at the corner of Forty-second street and Madison avenue.

The Tariff Bill in the Senate

The passage of the Underwood tariff bill in the House, without substantial amendment, was a foregone conclusion. All of its provisions had been considered and approved by a party caucus. Because the party had a majority of about two to one in the House, the action of the caucus was easily confirmed there. There was criticism, it is true, and even opposition, on the Democratic side, but at the end only five Democrats voted against the bill. It now goes to the Senate, where, in the course of a debate that will probably consume two months, some changes will be made.

It may be that some who voted for the bill in the House expected that amendments in accord with their views would be made in the Senate. There are errors which should be corrected and defects which should be removed. There will be an attempt to take wool from the free list and to impose a duty of 15 or 20 per cent. We do not regard the free-listing of wool as an error. The duty on wool should be cut off. We hope that the movement to retain any part of the present rate will be unsuccessful. We shall be glad to hear, however, that the Senate has rejected the provisions of the House bill concerning sugar. We are not supporting a differential for the protection of the refiners, whose sins have been many and great, but the duty on raw sugar should be retained. Our reasons for this opinion were recently set forth in these pages. They relate to the domestic beet and cane industries, the cane plantations of Hawaii, Porto Rico and the Philippines, the preferential for Cuba, the revenue of $52,000,000, and the probability that a surrender of it would not appreciably affect the cost of living.

As it stands, the bill violates many treaties by granting a discount of 5 per cent of the duties on goods imported "in vessels built in the United States, or which shall be wholly the property of a citizen or citizens of the United States." This is merely a disguised subsidy, and should be rejected even if it were not at variance with international agreements. Protests made by several nations have been ignored. Mr. Underwood would give them no weight. It is reported that he said the enactment of this provision would cause several treaties to die automatically, and that the continued existence of them was not to be desired. The agreements in question have clauses like that in the treaty of 1902 with Spain, which provides that goods imported into this country in Spanish vessels shall not be "liable to any other or higher duties or charges whatsoever than if such articles were imported in United States vessels." Our treaty with Great Britain says that the duties paid on goods in British vessels and in American vessels shall be "the same." The binding force of such agreements is recognized in that part of the bill which imposes a "discriminating duty of 10 per cent in addition to the duties imposed by law" upon goods "imported in vessels not of the United States," but with an accompanying proviso that this shall not apply to vessels empowered by treaty to import goods at the statutory rates. That is to say, this discrimination could be effective only with respect to ships of countries with which we have no restraining

treaty. Both of these discriminatory or subsidizing paragraphs should promptly be rejected by the Senate.

There should be no duty on raw materials the products of which are on the free list, nor should the duties on partly manufactured articles be higher than those upon the finished goods of which these articles are parts. If flour is free, there should be no duty on wheat. There should be no duty on cattle, if beef is on the free list. There are several other examples of a violation of this rule. Such defects should be removed by the Senate.

In the long and complicated provisions relating to the administration of the law there is much which has excited protest abroad. France and one or two other European nations complain sharply, and it is predicted that the enactment of these provisions would be followed by tariff retaliation. Among the clauses to which objection is made is one that compels foreign manufacturers to open their books to agents of our Government. There are others which tend to discourage or to prevent importation. A prominent French journal calls them "masked protectionism." They have been attacked not only in Europe, but also by leading importers in this country. The Senate should examine them carefully and reject or amend them.

That part of the bill which imposes an income tax is complicated and perplexing. For this reason it has been sharply criticised by persons who think there ought to be an income tax. Many columns of the daily press have been filled with expressions of their disapproval. We are inclined to think that the income tax sections should be rewritten and thus made clear. This matter should have careful consideration in the Senate.

California Dux

We have had occasion to express great regret that California should by unkindly legislation provoke a kindly nation. We are glad to rejoice that in another very important matter she dares to lead all the states.

We hope our readers will take in the full meaning of the statement made by a correspondent that in its new and progressive legislation California has decided to abolish utterly one of the two great twin evils of modern society, the commerce in social vice. Various cities have of late made enactments, more or less fully carried out, closing all houses of prostitution, but never before has a state done this; and for this purpose California deserves great credit. She may fail in part, and it may take years to achieve the result aimed at, but the standard is set, and the legal machinery is provided for. Even Maine and Kansas have not wholly banished the saloon.

It is a good sign that this social evil and shame to both man and woman, this moral leprosy on the body politic, even more corrupting than the saloon, with its attendant physical diseases, its blacker plague worse than that which Friedmann claims to cure, has at last been brought into the open with all its deformity; and hygiene and morality and religion have all opened their eyes and are combined to find a way to end it. It can slink and skulk no more. Somehow it has been assumed hitherto that it is a necessary evil; we now know better. Our medical commissions tell us it must be suppressed. It is their business to tell the horrors of its spread of disease and its contamination even of the innocent. Morality and religion join in the crusade, shamed at its degradation of the victims of the unholy traffic, while very properly demanding that our pure girls should be protected by the assurance that they wed in safety. Now the city and the state declare and must declare that the brothel must go, but with all charity for the poor victims of vice. In California the good men and women who are engaged in enforcing the law have made provision for introducing those who are driven out into comfortable methods of livelihood.

Out of charity good women are taking everywhere the lead in this crusade; but out of shame the men ought to march in step with them. The crime is men's more than women's. They support it, they find the victims. Weakness succumbs to strength and passion. It is the men that should bear the chief contempt. If there must be supervision and segregation, it is the men who should suffer. Both sexes suffer and both are guilty; and we are not surprised that it should

be a state which gives votes to both men and women that inaugurates this great reform.

The provision for commercialized vice is the greatest foe of honorable marriage. It has been endured on the pretense that it is a necessary evil, that men require it. Accordingly guilty men are excused, who support it, while less guilty women are branded and segregated. We venture to reprint this defense of men taken from a report in the *Medical Record*, written by a physician in charge of a hospital for the cure of venereal diseases in San Francisco. He says:

> In spite of the unjustifiable survival of antiquated dead letter laws, public opinion in the present age does not condemn sexual intercourse among single persons unqualifiedly as a crime or vice. Regardless of the Criminal Code, society recognizes the elementary passion of sexual desire as a natural endowment of the normal red-blooded male individuals and its reasonable satisfaction as a more or less personal matter.

Therefore—that is his argument—let women victims be carefully segregated and medically inspected for the safe gratification of masculine lust. Mormon polygamy is better.

Another Amendment Needed

That one state, or two or three, should have the right and power by their treatment of citizens of other countries to create hostility and to provoke if not occasion war, is a condition simply intolerable. It ought not to exist under our government.

But it does exist. It should be corrected.

It can be corrected by an amendment to the Constitution. The substance and meaning of such an amendment is something like the following:

All legislation affecting the rights and privileges of citizens of other countries residing in the United States, as distinct from and other than the rights and privileges of citizens of the United States, shall belong to Congress exclusively.

Why should not such an amendment to the Constitution be adopted? We suggest it for the approval of intelligent men who love peace and who are alarmed at such hostile discrimination as that which has so greatly disturbed the President and his Cabinet, and has so provoked a friendly Power.

The Police Convictions

Step by step District Attorney Whitman has carried up his prosecutions of police graft in this city until he has reached the upper level and four ex-inspectors have been convicted of being in the ring of conspirators. It was in as dirty and contemptible a business as can be conceived that they were engaged, nothing less than selling protection to gambling houses and houses of prostitution. The men appointed to protect the city protected its thieves, were partners with thieves, for what are gamblers and traffickers in prostitution but thieves? They not only are a disgrace to the Police Department, but have shamed the city before the world; and so clear was the evidence that the jury did not need to take a ballot.

But this is not the end. There can be little doubt that there are others quite as guilty. To reorganize completely the police government of New York requires a mayor of purpose and will. So far as seen, the sympathy and help of the department has gone to the accused. There may well be much more work for Mr Whitman to do.

In Cicero's day there was no method by which a lawyer could so well gain popular renown as by prosecuting some greedy quaestor or pro-consul who had been robbing a province by graft. Cicero, in his letters to Mæcenas, is careful to tell his powerful patron how he, as ruler of a province, bought all the supplies needed for himself and his retinue, and forced the subjects to give absolutely nothing. It was a new and grateful experience for a Roman province in Asia. But these four inspectors of ours had never read *Cicero Against Verres*. That is not seriously against them, any more than it is a reflection against Ireland that each one of the four was of Irish birth or Irish parentage. That only shows how active our Irish fellow citizens have been in governing us, while the Irishmen who stayed at home could not govern their own island.

We do not know any better way to

make our police system all that it ought to be, and what so many of its members wish it to be, than for the people to unite against Tammany and elect Charles S. Whitman as Mayor.

Protestant or Catholic?

Having published two articles—one from an Episcopalian clergyman and the other by a non-Episcopalian, both giving arguments against the proposal to change the name of the Protestant Episcopalian Church, we are glad this week to give similar space to the defenders of the change.

The meaning of the name "Protestant Episcopal" is that the Church, tho episcopal, like the Church of Rome, is yet Protestant, that in its government it depends on bishops as well as on priests; also that, like other Protestant Churches, it protests its own independence from Rome and protests against Rome. This it does not only in its Thirty-nine Articles, but in the writings of all its theologians, even of those who most copy the ceremonies of the Roman Catholic Church. Whatever name it may take, it will remain Protestant, because it will continue to deny and to protest against the authority of the Roman Pontiff.

Why then should it wish to change its name? Simply because the name "Protestant Episcopal" is not an agreeable one. It seems to and does imply and declare a position of hostility. It means a protest against Rome. But why not say what you are, and why insist upon telling what you are not? Because a name should define positively, not negatively; should tell what you are, not burden itself with telling what you are not. To be sure, the name "Protestant" has come to connote fellowship with a large and noble sisterhood of Churches, but it also connotes opposition to the greatest of all the Christian bodies, and that is not an agreeable attitude. We would rather think of what we have in common with it, and not of the less important matters in which we differ from it.

So far as we can see, it would be quite as well if the name "Protestant" had never been assumed, and, therefore, just as well if the somewhat offensive name were dropt. That would leave it "The American Episcopal Church," a characteristic name, and the name by which in fact it is usually called. To drop the name "Protestant" would not make it less Protestant, nor one whit less in sympathy with other Protestant denominations.

But to call it, as many desire, by the name of the American *Catholic* Church, is quite another thing. It would be taking a name which does not belong to it. It is not catholic, but a section, a fraction of the great Catholic Church, which includes the Roman and the Eastern Churches, and all the Protestant denominations as well. It would be an impertinence to Rome to take its usual designation, and an insult to other bodies, such as the Methodists, Baptists and Presbyterians, implying that they are not catholic or Catholic, quite as much as the Episcopalians. The Church of Rome has the prior right to the name, altho it has not half of the Catholic Church Universal, and is therefore sectarian, like all the rest of us, and is not truly catholic.

The only effective defense of the substitution of the name "Catholic" for "Protestant" is to assert that the sympathy and fellowship of the Protestant Episcopal Church is with the Church of Rome and not with the Protestants. Indeed, this is the position definitely asserted by one of our writers this week, who mentions, what we usually forget, that a protestant clergyman who joins the Episcopal Church has to be reordained, as if his previous ordination were invalid, while a priest of the Roman Church joining it does not have to be reordained; and similarly a Protestant layman joining it has to be confirmed, but not if he comes from the Church of Rome. This is an unhappy, if not schismatic position, but it means simply that the Church of Rome and the Episcopal Church both claim to have maintained the episcopal succession from the time of the apostles, while the non-episcopal Protestant Churches have lost it; but that does not make the Episcopal Church any the less Protestant. In one respect it agrees with Rome, in having bishops; but it still protests, whether it keeps the name or not.

But we do not believe there is any dan-

ger that the school in the Episcopal Church which hankers after the name "Catholic," and tries to divide it with the Catholic Church, will prevail in the coming convention. If, however, the name "Protestant" should be dropt, no one need be much concerned over it. It would still be Protestant and still protesting just the same, and still refused fellowship at Rome.

Report on Dr. Friedmann's Cure

It is only a preliminary report which was made last week before the National Association for the Study and Prevention of Tuberculosis by Dr. J. F. Anderson, director of the Government hygienic laboratory, and Dr. A. M. Stimson, who had been detailed to watch the treatment by Dr. Friedmann of the patients under his care at the Mount Sinai Hospital, in this city. Their report is not favorable, but yet not conclusive.

They have not had from Dr. Friedmann the information and aid they desired. He has been secretive as to the preparation and application of his remedy. The reason for this they do not give, but we may guess that it has to do with the rights he has sold to a company to use the remedy. They find that the cure will take a long time, and they are not at all clear that it has given any specific benefit beyond the psychic advantage of hope and faith. They will pursue the investigation, but they are very emphatic in warning sufferers from tuberculosis not to neglect the old and tried methods of cure.

Tuberculosis causes the death of one-seventh of those who die of disease. It has its periods of gain and loss, and is a deceptive disease which gives encouragement even during its progress. We have already said that the Friedmann cure is not yet accepted by the faculty either in Germany or in this country, and the press exploitation of it is not to be taken as assuring its value.

Why We Simplify

We go back, or think we ought to go back, to a simpler life; shall we not also have a simpler spelling?

THE INDEPENDENT has taken a few steps in this direction, not many, for a complete simplification is not so simple. In the first place, a thoro simplification would be phonetic spelling, and that is impossible with only twenty-six letters, of which two are superfluous, while there are over forty sounds. Besides, such a simplification as our alphabet would allow, made all at once, would be too great a strain on the reading public. Even our own readers, who are a progressive and thinking class, would find it too much. Even some of our readers love old ways and do not like the few simplifications we have adopted.

Then why did we adopt them? Not, certainly, because we did not care how they felt. By no means. We would not say with Milton to Salmasius, "*Si non lubeat rumpatur,*" which being interpreted into the vernacular is, "If he does not like it he may lump it," for while we wish to give our readers what will please them, we even more wish to give them what ought to please them.

Of course, nobody ought to like bad spelling, and *though* is bad spelling. Only one of its letters has its own pronunciation. There are six letters and only two sounds. Three letters are a useless burden to the word. The spelling is detestable and ought to be changed, for the benefit of us who write and are used to it, and of our children and of foreigners. We are reformers—it is an age of reform—and let us begin right there and write it *tho.* That is a start; that settles the principle; it pledges us to the reform, and all the rest will come easier some day.

But a journal must not go too fast. We cannot correct our bungling orthography all at once. We have set the principle, with the aid of our readers, most of whom are progressive enough to approve, and we will go a little way, not far: say *tho, altho, thru,* the three radical changes that settle the principle, and then easier ones, such as *program, catalog,* and a few like them, and some other words, whose simple spelling does not offend us, such as *fixt, blest, prest,* with which we are familiar in the spelling of the poets. There may be fifty such words, more or less, which make no great difference in the looks of a page, and which the readers very easily get used to. We have very few complaints; a few, and we

expected them. If any readers are so pained that it gives them the headache and the heartache, let them confine their reading to London journals, and they can then gloat over *honour, labour, storey,* etc., to their hearts' delight, the kind of spelling our fathers learned, but from which Noah Webster delivered us. We are only following in the steps of Noah Webster and dozens of others who have simplified since Shakespeare.

If THE INDEPENDENT has been a leader, we have not gone nearly as far in the reform as pretty nearly all the scholars of English wish. They know how much simplification has been achieved in three centuries and how much more is needed. We would have our dailies, weeklies and monthlies think of the matter, and see what they can do, at least those journals that are progressive, that believe in reform, that would lead rather than follow. To do it is not so hard as it may seem, and the readers will not be offended. It is bound to come. The universities are adopting it, and the teachers' associations. The movement is on the advance, and there is no lion in the way. We are not in the condition of the fox which had lost its tail in a trap and asked other foxes to cut off their tails, for we purposely cut off the tail of *though* and are glad of it. We could put it on again, but we shall not. Simplification is right; the children cry for it, and they shall have it, and more of it. It will do them good, and it is the business of the press to give it. His help to it is one of the good things, like libraries and peace, for which we have to thank Mr. Carnegie.

What Is the Best Thing in Your Town?

Our "Survey of the World" in its present form is intended to include, among other things, whatever is being done anywhere to make life happier, healthier and more efficient. In this we need the coöperation of our readers, and we hope they will respond as obligingly as they did when we asked them who were the most useful Americans. Great movements are not always started by great men, and the things most worth knowing may fail to be widely known. Every town, big or little, doubtless has or at least thinks it has some advantage over all other towns, and these are what we should like to hear about. Just as housewives exchange recipes thru the medium of the family paper, so new wrinkles in municipal housekeeping might well be given to the public. If then you have anything that you are particularly proud of and which you think other communities might profitably imitate, just take the trouble to put it down on paper and send it to the editor of THE INDEPENDENT. If we agree with you as to its novelty and importance, and have not too many other contributions on hand, we shall be glad to publish it. It may be a new-fangled charter or hitching post, a public market or a park, a festival or sewer system, but there must be something that the visitor to your village or city would notice and admire. Don't use more than 400 words in telling about it if you can help yourself, and send with it a good photograph or sketch if needed to illustrate the point.

Meddling Legislation

THE INDEPENDENT has not been led away, either by its own honest desire for social reform or by the popular enthusiasm for upsetting and transforming existing social order. We have desired to go slow in adopting measures which concern the family; particularly child labor and divers forms of pensioning. We believe that it has been wise to hold ourselves in check at this revolutionary point, whatever may be the evolutionary result. It is very clear to a sane mind that vast social changes are imminent; all the more reason that they should be cautiously approached.

The fact stands certain that family government was constituted with good reason. It is with equally good reason that the obligation of the child is toward the parent, and that of the parents toward the child. Social order is healthy and sane only when the whole family is constituted on the basis of obligation. Nature never intended the wife as a burden, or the child as a mere number in the family—certainly not to wear out the parents with added toil.

There are thousands of boys called

upon to support widowed mothers and dependent sisters; by working in the fields, in the factory and the office; by selling newspapers and acting as messenger boys. This obligation is infinitely diverse in form, but it touches nine-tenths of all boys and girls. Very few of them ought to be relieved by statute from doing something toward the relief of the burdens that rest on their parents. The danger of legislating on this subject is illustrated by a child labor bill now pending in Florida.

This bill enacts that no boy under ten years of age and no girl under sixteen years of age shall distribute, sell, or expose for sale newspapers and periodicals in any public place; no child under twelve years of age shall be employed, or allowed to work about any stores or offices or in the transmission of merchandise, or even messages. It goes farther and demands that no child under fourteen years of age shall be allowed to work in or about any mill, factory, workshop, restaurant, bakery, barber shop, hotel, bootblack stand, etc., or in the construction and repair of buildings.

This reads like a myth. It seems impossible that reform should go mad to such an extent. Our social life is altogether too complex for such a drastic bill. It will be impossible to distribute labor, either in the family or in the community, in such a way as to eliminate children from helping. In the home all the results of child help would be subtracted, and the burden that falls upon parents would be intolerably increased. The advantages to the children would in no way compensate for the release from labor. In fact, the tendency would be to ruin the child rather than to raise him.

Going to school, in the view of a common sense citizen, does not consist in sending children to teachers in a public building, but largely consists in the information and the strengthening of character which is secured from work. The bootblack is no fool, if he can neither read nor write, nor pass an examination in arithmetic. The farm boy gathers by far the largest part of his mental equipment in the meadows and pastures and around the barns of his home. The scythe and the ax and the plow are all professors of accuracy, achievement and poetry. We must never for a moment lose sight of the fact that home is school, and that no other school can surpass it. Then again the boy's companionship and opportunity for character building is not likely to be any worse where labor is reasonably overlooked than in the public schools as they are usually controlled.

In fact we are convinced that this subject is running wild. There are wrongs associated with child labor; let them be corrected. But at the same time let us start the whole subject with the understanding that nothing better has ever occurred to any child than to teach him or her how to work, how to achieve, and how to take joy in the accomplishments. There is nothing worse about the whole topic, in its more radical shaping, than the assumption that labor or work is demeaning or injurious. We believe that labor is learning, and that a good deal more than one-half of the education of a farm boy is home education, got in the barnyard and in the plowed fields.

The mother at fifty may be much less able to earn than the girl at ten or twelve. Let Nature dictate; let legislation encourage mutual helpfulness. Work on the farm cannot be considered as entirely exceptional. It is exceptional only in this, that it gives better air as a rule, and supplies sufficient food of a healthful sort. President Finley of the Southern Railway Company urges that the state can do nothing better than save the boy crop to make the corn crop. He shows how recently we are becoming dependent on the youngsters for that sort of progress which makes a corn crop of fifty bushels to the acre take the place of a crop of fifteen bushels to the acre. No wrong has been done to the lads by teaching them to compete with their elders, and surpass them in feeding the people as well as themselves.

Perfect Babies

Dr. L. Emmett Holt and other physicians have had the happy thought of inviting the mothers of New York's most crowded sections to wash and groom their young offspring, and enter them in a new kind of baby contest. Here the

awards are made more scientifically than in such shows as have been featured at our American summer resorts, and the results are edifying. Thirteen "perfect" babies were found among the thousand exhibited. Most of these were boys, but as yet the suffragets have not protested at this sex favoritism.

The first infant given a mark of 1000 on the scale of 1000 was one Abe Idolowitz, three months and fifteen days old, and a resident from birth of Eldridge street, on Manhattan's East Side. His parents are Rumanian Jews, the father a tailor, whose shop and living rooms are *en suite*. Abe's mother is twenty-four years of age and married at fifteen: a representative of that class of "improvident poor" about which we hear much argument. Abe is not a eugenic product, but he has made a fine start in spite of that. The lesson is salutary. Let no one despair of heredity or environment, but rather try to improve the latter and improve upon the former. And it is worth remembering that most of the world's leaders have not even been "perfect" babies, to begin with.

The City of New York, thru its district nurses, its city piers, its day nurseries and the like, offers much free instruction, and it is partly as a result of this that many an East Side mother maintains her children more intelligently than most farmers' wives do. James Russell Lowell once exprest himself as being more interested in his descendants than in his ancestry, and we for our part take more stock in eugenics and pediatrics—even tho the value of these branches of science is at times unhumorously exaggerated—than in all the genealogical societies.

Philippine Independence

There is no question about which the future of the present Administration raises more curiosity than its attitude toward the independence of the Philippine Islands. The Democratic platform declared for it, mainly, we presume, because it was necessary to condemn the policy of the preceding Administrations; but we observe that the President and his Cabinet have been very quiet on the subject. To be sure, a Virginia Democrat has introduced a bill giving independence eight years hence, but that bill slumbers in the House. What will they do?

We presume they will do nothing. It is not likely, for all the platform, that they will throw off our obligation to those islands, and for our judgment we give just one of the reasons.

We do not believe the Catholic Church in this country wishes it. We do not believe they think that the Catholic Church would receive the protection from Aguinaldo and the other Filipino leaders that it gets from the United States. For protection and justice the Catholic Church the world over must look to Protestant nations, not to Catholic.

We observe also that the leaders in the Catholic Church do not wish the American Government to withdraw. Cardinal Gibbons has said so definitely. Archbishop Harty, of Manila, is at the head of the Catholic Church in the Philippines, a very able American, and he seeks no change. He enthusiastically praises American government there. We hear no voice from the leaders of the Church in this country, or from its journals, nor from the American bishops in the Philippines, in favor of independence.

Now, if the Catholics of the United States, most of them Democrats, do not want independence for the Philippines, we may conclude that the present Administration will be very reluctant to grant it. They claim fifteen millions of our population, besides ten millions more in our possessions. Their votes are very valuable. The influence of the American bishops is reorganizing the Church in the islands, whose influence was nearly lost under Spanish rule and in the interregnum. That work these bishops wish to carry on, and it is only American occupation that will give them protection and peace. Were we to withdraw there would be anarchy in thirty days. The Filipinos of Luzon would be in power, and Mindanao hates them far worse than it does the Americans, and would never submit. This is the opinion of all classes of Americans and foreigners in the Philippines, Protestants and Catholics alike, soldiers and civilians. And yet it must be

admitted that nearly all the Filipinos in public life cry for independence. One of them would be President. It might be Aguinaldo, who is now getting ready his adherents; or it might be Señor Quezon, the Philippine Delegate in Congress; or it might be Señor Osmerxo, Speaker of the Philippine Assembly.

But they do not mean actual independence. They believe that if left to themselves Japan would take the islands speedily, and then woe to all that might oppose. There would be no more mercy than in Formosa. What they want is for the United States to withdraw and keep its hands off, but that it should still hold its army and navy outside to protect them from foreign attack. We should thus guarantee their liberty to rule or fight as they choose, and also guarantee their independence against other nations. That is an entangling alliance which we should be so slow to accept that it may be dismissed as impracticable. We will wait and see what President Wilson and Congress will do, being pretty confident that they will hesitate much to destroy the good work which we have done, having accomplished more in a dozen years than Spain had done for the islands in three centuries.

Slighting Southern Literature

One of the duties which the Daughters of the Confederacy are still carrying on, half a century after the Confederacy ceased to exist, is to maintain in the public schools of the South the righteousness of its cause and the grandeur of its heroes.

Mrs. T. Randolph Leigh is the state historian of the Daughters for Alabama, and she has come out in a protest against the use in the high schools of the state and of the South of an "Introduction" to the study of American literature, by Prof. Brander Matthews. She complains that he has done no justice to Southern writers. The book, she complains, contains twenty-eight portraits of literary men, of whom but two, Poe and Joel Chandler Harris, are Southerners, and Poe, says the author, was born in Boston. Too much space, she says, is given to Northern writers. Professor Matthews says that Benjamin Franklin and Jonathan Edwards were the first American writers to attract attention abroad, but, says Mrs. Leigh, he does not mention Captain John Smith, of Pocahontas fame, nor the scientist William Longstreet. Cooper, she tells us, is no greater than Sims, Irving than Cooke, Bryant than Wilde, Emerson than Beverly Tucker, Hawthorne than James Lane Allen, or Longfellow than Father Ryan. On the space given to Whittier she vents her scorn:

> Seventeen pages are given to that plebeian, Whittier, whose clumsy pen so often stumbled and fell as he mixt indifferent verse with abolition dribble with such rancor that his own fellow-citizens rose up as an indignant mob and sacked and burnt his printing office.

Certainly let the Daughters write their own history of literature, and on this showing it will be interesting, if not informing. A really fine history of Southern literature could be written, in which the major names would be of Poe, Lanier and Chandler Harris, with sufficient of the second rank to fill a fat volume. As the old fable suggests, let the lion paint the picture.

In Brief

When King Alfonso of Spain praised to M. Poincaré the big Norman bay horse provided for him as a mount at a military review at Fontainbleau, the President of France presented the animal to the King. This graceful action was truly in the Castillian spirit. The traveler in Spain knows how dangerous it is to praise anything belonging to one's host. The object praised is very likely to make its appearance next day at your hotel—with a card of presentation signed by your generous host. Such are the manners of the olden time.

Dr. Manning, of Trinity Church, New York, gives as one reason for changing the "cumbersome and ugly legal title" of the Protestant Episcopal Church, that "it puts the Church in the light of a modern denomination instead of in its true light as a part of the ancient, historic Catholic Church." But are not all these denominations parts of the ancient Catholic Church of Christ?

We lately said that we did not recall that any American archbishop had, like Archbishop Delany, of New Zealand, exprest himself in favor of woman suffrage. But

this much is true, that Archbishop Riordan, of San Francisco, has issued a letter to all the priests in his diocese, bidding them point out to their people, women as well as men, the importance of the suffrage. He says: "In California woman's suffrage is now an accomplished fact. Women ought not, therefore, to permit their traditional love for the virtues of the home, their innate dignity and becoming reserve, to prevent them from discharging the chiefest of civic obligations."

The Episcopal diocese of Pennsylvania voted last week to ask a change in the constitution of the Church so as to allow proportional representation, instead of the present rule which allows a very small diocese to just as large a vote in the Convention as one as large as New York or Pennsylvania. But it is hard to make such a change, as Connecticut knows, where the lower house of its legislature is based on township rights.

General Huerta, President of Mexico, by right of seizure and the murder of his predecessor, complains because our Government does not give him official recognition. Why should we? When King Alexander and Queen Draga, of Servia, were murdered, and King Peter was called to the throne, did not all the Powers of Europe refuse to recognize him for years, thus expressing their horror of the crime? And Peter was not responsible for the murder; he was only its beneficiary.

If it was a cunning trick of President Taft putting fourth-class postmasters under civil service rules, and thus protecting them from removal by another Administration, the new Administration has found a trick worth two of it. It says these postmasters have never past an examination, and they must stand it, with other applicants, and may be replaced. That is a new scheme, and sounds plausible enough to work.

Our valued correspondent, Mr. E. P. Powell, celebrated, at Sorrento, Fla., last Friday, his eightieth birthday. The menu for dinner at 12 M. included Chinese Petsai, Dasheen, Passiflora Edulis, Loquat canned, Kumquat, and seedless grape-fruit, sugar oranges and five sorts of sweet potatoes; and on show were eight sorts of guava, forty sorts of alfalfa, nine sorts of spineless cacti, Natal and Rhodesia grasses in bouquets.

The United States cannot compare with Great Britain in the rate in which it is reducing its national debt. While the annual budget with which Mr. Lloyd George has to provide is nearly one billion dollars, out of this $60,000,000 is put aside every year to reduce the debt. Fifty years ago it was $4,100,000,000, while now it is $3,300,000,000. At the present rate it will take fifty-five years to extinguish the debt, if there is no war.

An item published in the Survey of the World, March 20, referred to the delicious taste of the Chinese tungshu. From the Department of Agriculture we have a communication telling us that its edibility is not proved, and that it is an oil-bearing tree, and its fruit is considered dangerous if not poisonous. We would not have our readers feed on it, for the Department has sent out many trees and will send out thousands more.

By a small majority Cambridge University allows divinity degrees to be given to those not of the Church of England; and by an overwhelming majority Oxford University refuses, altho such men as Drs. Scott Holland, Driver and Sanday supported it. This is the last refuge of privilege at the British universities.

With the virulent outbreaks of the militant suffragets it is not strange that the British House of Commons rejected a woman's suffrage bill on the first reading, and that the Irish contingent voted against it because they wished to take no chances for carrying thru in this Parliament Home Rule for Ireland.

While yet carefully guarded by his physicians, Pope Pius X is on the road to recovery and has given an audience to the Cardinals. That vision of his sister who prophesied his recovery, and said he had yet to finish his work, will now be made a miracle.

The Arizona bill forbidding aliens who do not declare their intention to become citizens to acquire land would seem to be mere buncombe. As reported in the press it would be easily declared by the courts to be unconstitutional and invalid.

Senator La Follette is out in a signed editorial in his weekly strongly condeming the removal of Mr. Durand as Director of the Census, and the replacing of him by a man utterly inexperienced in statistical work.

It is not wholly surprising that in leaving Scutari under compulsion, after having captured it, some soldiers set the city on fire. Even so Columbia, S. C., suffered from our Northern soldiers in the Civil War.

Danger Ahead in the Balkans

A Discussion of Present Conditions in the Conquered Country

By H. A. Gibbons

[With the capture of Scutari by the Montenegrins the allies have completed the task they set out to do. Now arises the question of the division of the spoils. This is the last of the series of articles which Professor Gibbons, writing from Robert College, has contributed to THE INDEPENDENT giving an inside view of the war. The other articles were published on September 26, 1912, November 7, 1912, and February 6, 1913.—EDITOR.]

As I am writing on April 9th, at Roumeli Hissar on the Bosphorus, I can hear the thunder of the Bulgarian cannon shelling the Turkish defenses at Tchataldja. It is not an unfamiliar sound. When we first heard it during the memorable days of November before the armistice, the Bulgarians had Adrianople in their rear. The Greeks were held in check before Janina. The great fortress of Tarabosch on Lake Scutari defied the Montenegrins, and was costing them a thousand lives a week. The Servians had not been able to cut off the retreat of the army they defeated at Kumanova.

But today things are different. The Turks have been driven out of Thrace, Macedonia, Albania and Epirus. All that is left of their empire in Europe is the city of Constantinople and the peninsula of Gallipoli. These two last footholds are threatened by the strong, victorious and confident armies at Tchataldja and Boulayir. Turkey is crying quits. She wants to make peace speedily. Her prestige has disappeared, her power is broken, and if the Allies succeed in getting their indemnity, as seems probable at this writing, she will not have the money to recuperate her army. Turkey will never again be a factor in Balkan politics. All who are on the ground here realize that the abasement of the Ottoman Empire is complete and final. So there is no danger ahead in the Balkan peninsula from a recuperation of the power of its erstwhile master.

The Great Powers are of course scolding. They are far from pleased that the Balkan States, whom they had become accustomed to regard as so many pawns to be moved upon the diplomatic chessboard as they willed, have carried on a successful war without their aid and in spite of their exprest wish. In grappling with the Albanian question, the Concert of Europe is showing the same ineptitude, irresolution and impotence as in the Macedonian and Cretan questions. My telegrams today tell me that the "international fleet" is making a "demonstration" before Antivari, the port of Montenegro, to coerce the Allies into giving up the attack upon Scutari. This latest move of European diplomacy will certainly prove as futile as all those which have preceded it during the past thirty-five years when it came to tackling the Eastern Question *in concert*. It is a pure bluff which will come to nothing because the union of the Powers is on the surface only. The Allies know this, and are paying no attention to "joint notes" of the chancelleries. If King Nicholas gives up Scutari it will be only in exchange for an excellent *quid pro quo*—some territories which the conference of ambassadors at London had decided solemnly not to give him.

Austria still feels that she ought to intervene in the Balkan settlement. When the Balkan War started, I explained in THE INDEPENDENT why Austria might be forced to this step. But what was conjecture on my part is now certain. Austrian intervention would bring today war with Russia. Against Russia alone Austria might hold her own. But now that Bulgaria, Servia, Greece and Montenegro have demonstrated the valor of their armies and have several hundred thousand trained soldiers in the field, and have proved that they could unite to wage war, Austria will hesitate much longer than she would have done before. Turkey's "million bayonets" no longer enter into Austrian calculations, and she would have both Russia and the Allies to face.

The danger ahead in the Balkans does not come from the Great Powers. It comes from within.

Astounding as were the successes of the Balkan armies against the Turks at every point in which they came into contact, they were not more astounding than the fact that the Allies have been able to go on month after month and preserve even the semblance of unity among themselves. I have already told the readers of THE INDEPENDENT that every man who knew the Balkan States and their armies and also the Turkish army was unprepared for Kirk Kilisse, Lule Burgas, Kumanova, Salonika, Janina and Adrianople. It is equally true that everyone expected that the Bulgarian, Greek and Servian armies would come into armed conflict with each other in Macedonia. Everyone who knows the history of the rival propagandas in Macedonia during the past ten years regards the preservation of the Balkan alliance after the rapid successes in Macedonia as one of the greatest miracles of history. Is the capture of Salonika as wonderful or as startlingly incredible an event as the peaceable joint occupation of that city by Greeks and Bulgarians?

There have not been lacking indications to show how difficult has been the keeping of the peace between the Allies. Until Bulgaria definitely gave up all pretentions to Salonika the week before the armistice was denounced, it seemed as if the war could not be reopened. The newspapers of Sofia and Athens were full of a futile discussion as to whether the Greeks or Bulgarians had really been responsible for the fall of Salonika. After the surrender of Adrianople, the same unedifying newspaper duel was opened between the Belgrade and Sofia press. Did the Servians capture any of the forts in the sector of Adrianople, the piercing of which led to the city's fall? While the Servians were claiming a rather undue share of credit, the Bulgarians were denying them any at all. The Greeks of Cavalla and Dedeagatch have raised a cry of the opprest against the Bulgarians. The Bulgarians of Monastir have sent out heartrending appeals to King Ferdinand to protect them against the Greeks and Servians.

I have the very highest authority for stating that the Young Turks, in making their *coup d'état* of January 23d, which drove out of power Kiamil Pasha and nullified the decision of the Great Divan of the empire to accept the terms of peace laid down by a joint note of the Great Powers, were counting upon the dissensions existing among the Allies. They hoped against hope that the "thieves would fall out," as it was exprest to me by a prominent Young Turk, and that they might thus still secure the boundaries of the Treaty of San Stefano. I am equally certain that the Austrian Foreign Office was expecting the same thing. Her journalists (I speak whereof I know) had been working strenuously to sow dissension among the Allies, and they thought they had succeeded. Every conflict between Servian, Greek and Bulgarian in the difficult question of military zones in Macedonia had been exaggerated, and secret emissaries were at work to poison the minds of the common soldier and officer. Has the devil ever any easier tares to sow than those of jealousy? Is there ever any field in which it is easier to sow such tares than the battlefield?

Had it not been for the wonderful power of M. Venizelos and the splendid spirit of M. Gueshoff, in whom their respective sovereigns had placed implicit confidence, and who had secured by their magnetism and success in diplomacy the respect and admiration of the higher army officers, I am inclined to believe the war could not have been reopened. Bismarck, beseeching the King of Prussia to veto the proposition of his victorious staff to enter Vienna after the battle of Königgratz, accomplished no more memorable and empire-building feat than M. Venizelos, when he triumphed over the chauvinism of his fellow Greeks at Salonika in the last week of January.

It is now certain that the accord among the Allies will last long enough to seal the fate of the Turk in Europe, and to prevent the creation of an exaggerated and artificial Albania. But when the treaty is executed which leaves to the Ottoman Empire in Europe only Constantinople, a narrow Sea of Marmora littoral and the peninsula of Gallipoli, what then? Austria has waited patiently. She may feel that she can afford to wait a little longer until the Allies begin to discuss among themselves the boundaries of the ceded territories. Will

their inability to agree among themselves give the European Powers the opportunity to step in and dictate the disposition of the Turk's lost provinces? This question cannot be answered today.

If the men who so admirably preside over the destinies of the Balkanic peoples at this critical period in their history can maintain the ascendancy which they have gained thru a successful war, they may be able to make their people listen to reason and work out an equitable division of the spoils. If they can do this *by themselves*, they will find themselves strong enough to resist, as they have resisted up to the present, the by no means disinterested counsels of Europe.

But their task is so difficult and so complicated that when we work it out on paper we almost despair of their succeeding.

When the Turks conquered the Balkan Peninsula they submitted to the Turkish rule a confused mass of races, none of which had a national existence in our modern understanding of the nation. The Servians, Bulgarians and Greeks had no well-defined political organisms. The "empires" of which their historians speak were merely the ephemeral conquests of individuals. In the Balkan Peninsula affairs were in the same transitional stage as in the rest of Europe. The growth of nations as political entities, where geographical and economic interests, and not dynastic ambitions, were the predominant factors in deciding what peoples should live under a common flag, was not noticeable in Europe until one hundred and fifty to two hundred years after the Balkan Peninsula had been incorporated in the Ottoman dominions.

Under the Turk, the Christian peoples have had a totally different development from the rest of Europe. For centuries their idea of a nation is the union of people of common race and religion under their religious head, enjoying certain well-defined privileges of autonomous government. Mahomet the Conqueror, realizing that he could consolidate his conquests only by winning the support of the Christian elements, granted this form of government to his Christian subjects under the headship of the Church. As the Moslems are governed entirely by the religious laws of the Koran, which cannot in all matters be applied to Christians, this was the only possible *modus vivendi*.

In the case of the Greeks and Armenians and Syrians and Copts in Asia and Africa the system worked excellently, for each race had its national church. But in Macedonia, Bulgaria, Servia and Rumania (then the two provinces of Moldavia and Wallachia) there was one religion, altho different races. The Greek Patriarch of Constantinople, from his palace at Phanar on the Bosphorus, controlled the destinies of all the Balkan races. The Turk did not differentiate between these races. They were all called the Greek *millet*. When the spirit of nationality made itself felt a hundred years ago, the Greek hierarchy opprest and held under the non-Hellenic races, regarding their demands for the use of their own language in the ritual, and even in schools, as an ecclesiastical heresy. The result has been a century-old struggle between the races of Macedonia, which, owing to the Turkish scheme of things, found recognition only thru ecclesiastical separation. The Servians and Rumanians, and later the Bulgarians, had to form autocephalous churches, altho their creed always has been and is one with that of the Greek Orthodox Church.

When Servia and Bulgaria became autonomous provinces, and then practically independent states, they realized that some day Macedonia would have to be given up by the Turks. So a religious, racial and political struggle began between Bulgaria, Servia and Greece to gain the inhabitants of Macedonia to their side. The struggle started in every village in an endeavor to get control of the local church. It was fostered by an elaborate system of rival schools whose purpose was to awaken patriotic feelings by exciting and keeping alive racial animosity, and it finally degenerated into a propaganda of violence, in which the poor villagers have suffered for years from the "bullying" of bands of desperados. Many villages became Greek, Servian and Bulgarian in turn, according to the "band" which was most powerful or which they most feared.

One can readily see how both Turkey and Austria looked with favor upon this situation, Turkey because it enabled her to treat the Balkan States with contempt and keep the unhappy Macedonians under her yoke, and Austria because a Macedonia torn with internal strife was a favorable omen for her coveted territorial advance to Salonika.

It would be impossible to find words strong enough to condemn this fratricidal strife and to depict its horrors. The "bands" were managed directly from Athens, Sofia and Belgrade, with governmental connivance if not support. Begun with the intention of freeing their Macedonian co-nationalists, this propaganda only riveted more firmly the chains of servitude to the Turk. A generation was brought into the world and raised with inborn racial hatred. The hatred of Christian for Turk is nothing, Moslem fanaticism is nothing, in comparison with the feeling of the Macedonian for his fellow Christian of another race.

This is the generation which now inhabits the redeemed provinces which must somehow be divided among the Allies. No race lives in one locality adjacent to the present boundaries of the mother nation. Greeks, Bulgarians, and, to some extent, Servians are mixed up like a checkerboard in Macedonia. Greeks and Bulgarians have no well-defined limits in Thrace. Many thousand Bulgarian-speaking people are claimed by the Greeks as Greeks because they never separated from the Orthodox Church! The Greeks predominate in every seacoast town, and the Bulgarians and Servians in the interior. To add to the confusion, there are the Albanians in large numbers far outside the limits of any possible independent Albania; and in different places, as a sharp thorn in the flesh, Wallachians or Rumanians. Fully 20 per cent of the Macedonians have been so terrorized by the "bands" and have changed their nationality so often that they do not know to what race they really do belong!

In advocating division of territory, the most absurd arguments are being brought forth. The Greeks go back to Alexander the Great, and where he does not convince, to the Byzantine Empire. The Servians cite the empire of Stephen Dushan, and the Bulgarians that of John Asan. As all Macedonia was once in the dominions of Alexander the Great and the Byzantines, and as most of it was successively conquered by Servian and Bulgarian kings, a division along historical lines is impossible. It is absurd to conjure up memories of ephemeral dynasties which have not the slightest relation with our modern conception of a state or nation. Next to the historical argument is the ethnological. Here, as I have indicated above, we come also to debatable ground. The Greeks call for a plebiscite to show the *free choice* of the people in the territories *occupied by their armies*. But the shades of the plebiscites of the two Napoleons rise up to mock at this suggestion.

Of course, the boundaries of the Balkan States will be settled by political, geographical and, above all, economic considerations. But, across the haze of racial rivalry, it is going to be difficult to work out a scheme which will receive the loyal support of the Balkan parliaments. A great danger lies here.

The greatest danger, however, is in the attitude of the populations who will be compelled to bend to the inevitable, and find themselves denationalized. For, whatever arrangement is concluded, Bulgaria will have her hundreds of thousands of Greeks, and Greece her hundreds of thousands of Bulgarians. Under any circumstances such a situation would present difficulties. But when we consider how these Macedonians have been educated, and realize that hatred of the rival race has been a part of their daily life and religion from infancy, we may well have grave forebodings.

As in the case of the United States with its negro problem, the Balkan States will have to reap what they have sowed. Only the most consummate skill in statesmanship can prevent the danger ahead. Unless the Balkan States can produce in large numbers men of a rare type of leadership, a war between Bulgaria and Greece, delayed perhaps until after recuperation, can hardly be avoided.

Constantinople.

Why the Protestant Episcopal Church Should Change Its Name

[The article by the Rev. G. Monroe Royce on "Repudiation of a Church Name" in our issue of April 10, 1913, aroused, as we anticipated, considerable criticism and discussion. In accordance with our policy of presenting various sides of pending questions we sent the article on publication to representatives of the opposing opinion requesting them to answer the author. Besides this many of our readers were kind enough to favor us with replies and comments. To publish any considerable proportion of these interesting communications would be impossible, so we have selected the following as typical, altho we have been obliged to curtail some of them in order to get them in and to avoid repetition. Comments on the proposed change of name of the Protestant Episcopal Church from the outside standpoint will be found in the article by Prof. Benjamin W. Bacon, of Yale, in THE INDEPENDENT of April 24 and in our editorials of April 10 and the present issue. This is all the space we can devote to the controversy at present.—EDITOR.]

The Reasons for the Change

In the interests of truth and justice the hospitality of the columns of THE INDEPENDENT is craved for a reply to the article on "The Repudiation of a Church Name," by the Rev. G. Monroe Royce, which appeared in the issue of April 10.

No fault can be found with the good-natured vigor with which the proposal to change the name of the Protestant Episcopal Church is assailed in the article in question. It has excited considerable opposition thruout the country and Mr. Royce is entitled to express his view. But the gravest exception can very properly be taken against a presentation of the subject, in a magazine so influential and so widely read as THE INDEPENDENT, which is at one and the same time, inaccurate and inadequate. And possibly the rejoinder may come with the more grace from the pen of one who not only has taken no part in the agitation, but who also believes that the time is not ripe for the suggested change.

In the first place, some facts are not correctly stated. The article opens with the explicit statement that "The diocese of California . . . has, according to the public press, adopted a resolution expressing a wish that the name of the Church may be changed to The Holy Catholic Church of America." It is quite possible that the daily newspapers did so misrepresent the action of the California diocese, but an accurate statement of what action was taken at that convention appeared in the church papers of February 22. From those reports it would appear that Mr. Royce has unwittingly, but most gravely, misrepresented the action of the Pacific churchmen. In justice to them it may be well to summarize their memorial to the General Convention. They asked:

1. The dropping of the word Protestant from the title of the Church, so that it would be known simply as The Episcopal Church in the United States of America.

2. The revision of the title page of the Book of Common Prayer so as to read:

> The Book of Common Prayer and Administration of the Sacraments and other Rites and Ceremonies of The Holy Catholic Church, according to the Use of that Branch thereof known as the Episcopal Church in the United States of America.

3. The appointment of a Joint Commission to bring the standards of the Church into harmony with this action.

4. To prepare a statement to be embodied in the "organic law" of this Church which "shall set forth the continuity of this Church, thru the ancient Church of England, from the historic Church founded by Christ himself; its loyalty to the principles established by and thru the Reformation of the Church of England as enshrined in the Book of Common Prayer; and its catholic and comprehensive character."

The California Convention did not therefore express a wish for the name of "The Holy Catholic Church in America"; they asked for "The Episcopal Church in the United States of America"—a vitally different thing. So far as the suggested change in the title of the Prayer Book is concerned all that was asked was the recognition of the unquestioned fact that the Episcopal Church is a branch of the Church Catholic. And, lest this change should be misunderstood, it was accompanied and safeguarded by an expression of unswerving loyalty to the principles of the Reformation.

Secondly, Mr. Royce emphasizes the statement that "the leaders of this movement appear to be for the most part alien clerics, who are Americans neither by birth nor citizenship; hence the total absence of any feeling of loyalty for the birth-name of the Church and its historic associations."

In proof of this statement he instances three men; the editor of the *American Catholic* on the Pacific coast; the editor of

The Churchman in New York, and a former priest of the Church in Philadelphia. It is true that each of these men was ordained outside the United States, but the implication that any one, or all three combined, is responsible for this agitation for a change of the name of the Church is without foundation. So far as California is concerned, the vote of the convention was unanimous, and the Philadelphia clergyman labored in America for thirty-five years. So far as the accomplished editor of *The Churchman* is concerned, he has only occupied the editorial chair for four months and has only written one editorial on this subject (March 15). I have just re-read that editorial. It frankly recognizes that the present name is open to grave objections; with equal frankness it recognizes the fact that many are opposed to the proposed change and pleads for the waiting until "some great religious impulse will make it clear that we can serve God and advance His Kingdom most effectively if we renounce the present name, from which so many shrink as sectarian, and assume some other designation which connects us more obviously with the Universal Body of Christ, the Church in which we believe: One, Catholic and Apostolic." In this connection it is worth while adding, that of the five clerical directors of *The Churchman,* four have signed a letter to the presiding bishop of the Church protesting against any change. The fact is that this proposal to change the name has been before the Church for more than forty years. Officially it has been before the General Convention for thirty-six years. In the year 1877 memorials were sent forward asking for this very thing. And at every General Convention since that time the project has been before the supreme court of the Church. To imply, as Mr. Royce does, that this idea has sprung from the brain of men who are not American citizens and were not ordained here, is contrary to the facts. The able and militant leader of the movement today is the son of an American bishop.

No one could possibly judge, from the statement in THE INDEPENDENT, that this proposal has grown steadily in the favor of the Church. When the diocese of Wisconsin, in 1877, petitioned the General Convention for the change of name, the vote was overwhelmingly against the proposal. In the House of Deputies the only votes cast in favor of it were those of two clerical deputies from Wisconsin. Not a single lay vote was cast for the change, and even the clerical vote of Wisconsin was divided—two in favor, and one against. The official record of the vote is as follows: Of the clergy there were 44 dioceses voting—noes 43, ayes 1; of the laity there were 39 dioceses voting—noes 39.

Compare with the foregoing the vote of the last General Convention (1910) on the proposal to strike out the word "Protestant," making the name "The Episcopal Church." In the clerical order the vote was, ayes 42 dioceses, noes 15; of the laity, ayes 31 dioceses, noes 24. In addition, the clerical vote of 10 dioceses, and in the lay vote 8 dioceses were divided.

Such a remarkable change of sentiment is not adequately explained either by the suggestion of a party triumph for the High Churchmen or the persistent agitation of a few foreign clergy. It has a deeper and more serious meaning. The fact is, a most interesting development has been taking place in the mind of the Church. In the beginning, and for a long time, the proposal to change the name was purely a party question. It was born and nurtured in the Middle West. In that section there is a group of comparatively small dioceses dominated by High Churchmen of whom the late Dr. De Koven was the distinguisht leader. They were advanced both in ritual and doctrine, and made up for their fewness in numbers by their persistence in agitation. Year by year these men brought forward this proposal, which was regularly defeated by a strict party vote. Now, this situation has completely changed. It is no longer a party question. Men of all schools of church thought are to be found in favor of some change, tho no common agreement as to what the new name shall be has been reached. What has brought about this change?

1. A deepening desire for unity both within and without the Church. There is no division quite so acute, and certainly none so grievous, as ecclesiastical and doctrinal division. The pages of the book of the history of the Protestant Episcopal Church are stained with the bitter strife of party. Members and ministers of one flock fought each the other with a zest worthy of a nobler cause. That day has gone, never to return. The split which resulted in the formation of the Reformed Episcopal Church could not now happen. The party spirit which refused confirmation to the election of Dr. De Koven to the episcopate in 1874 has spent itself. The protest against the consecration of that great modern saint, Phillips Brooks, would be impossible today. Comprehension has dethroned intolerance. Broad, Low and High Churchmen differ ecclesiastically and theologically still, but with this difference—they are willing to serve the same mother, realizing that each has a vision of the truth tho from a different angle. The Broad Churchman realizes

the value of an historic and corporate Body of Christ; the High Churchman recognizes the vital necessity of subjective religion, and the Low Churchman has a profound sense of the supremacy of truth. There are still parties—or schools of thought—but the partisan spirit is dying. Hence the interesting fact that the plea for a change of name is no longer the watchword of a party within the Church; no longer an effort to achieve a party triumph; it is the plea of men who passionately desire the Church to be catholic in name and in spirit.

As men have thus drawn closer together there has come to be a profound sense of the inadequacy of the name of the Church. It is true it is an ancient name; it is also true that it has a sectarian flavor. It is inadequate because it selects two aspects of the Church—Protestant and Episcopal—and rejects all others. The Church is Protestant and she is Episcopal, but she is more—she is the Body and the Bride of Christ; the Pillar and Ground of Truth; Apostolic and Catholic. What is asked for is some designation which will link her with her founder and Lord and mark her historic continuity. The Episcopal Church is a body which has the episcopate; the Protestant Church is a body which protested against the errors of Rome at the Reformation, but the Church of God is larger than either or both.

To this consideration must be added the fact that the present name has proved itself to be a very serious handicap in the mission field. Of late years the missionary work has greatly developed in countries where the term "Protestant" is incapable of meaning and translation, whilst in Latin countries it is an almost insuperable hindrance. So much so that on the recent organization of a native corporate Church in China both designations were omitted and the new body received the name of the Chinese Holy Catholic Church. . . .

But for one fact there would be no difficulty in agreeing on the name, "Catholic Church." That is, the fear that the dropping of the word Protestant would mean a repudiation of the essential principles for which the Church suffered and bled in the days of the English Reformation. Once the rank and file can be convinced that the proposed change of name is consistent with loyalty to the Reformation it can be effected without disquietude. It should therefore be noted well that the leaders of the movement are at one in their loyal adherence to the Reformed Anglican Church and that they have again and again exprest their loyalty in terms which admit of no misunderstanding.

Nor must it be forgotten that many devout men feel that the time has come when possession of the great word "Catholic" should be wrested from the Roman branch of the Christian Church. Just so long as we are content to call ourselves Protestants, will the Romanists arrogate to themselves the term Catholic, and in proof thereof will point to the name we are content to use. Men feel that they must claim their Catholic heritage and emphasize their historic continuity. If, for centuries, we have taught our people to say in the Apostles' Creed, "I believe in the Catholic Church," why should we shrink from the name?

E. Clowes Chorley
Rector of St. Philip's Church in the Highlands, Garrison, N. Y.

The Objections to "Protestant"

You will perhaps not be annoyed if I speak candidly with reference to the article in question, and your own editorial comment on page 793. In the first place, let me assure you that Mr. Royce does not represent the point of view of the larger and more central membership of this Church. Our Protestant friends are misled by the fact that conservative Episcopalians do not often appear in the general press in the expression of their views concerning ecclesiastical controversies. It is certain, however, that a large majority of our members, including various groups usually called moderates, conservatives, *via media* Churchmen, high and ritualistic Churchmen, are one and all opposed to the standpoint which is now conventionally signified by the word "Protestant." As you no doubt know, our people consider that that name has acquired a meaning which it did not have in its use by English Church people of the Reformation period. Whether rightly or wrongly—it is a historical question—we hold that the meaning of the term "Protestant," so far as it appears in English state documents and in our legal name, has reference solely to the rejection of papal claims, and of principles peculiar to the Roman Church. Today it conventionally stands for a rejection of even the mildest form of belief in the priesthood and in that group of doctrines which is popularly symbolized by the word ecclesiastical. In short, it is used as the antithesis of the word "Catholic," in its use up to very recent days.

Owing to this change of conventional meaning, the name "Protestant" in our legal title has, in the estimation of a very considerable majority of Episcopalians, come to mislead the world at large as to our position. This Church never has been what you signify by your use of the word "Protestant"—that is, when you are not discus-

sing our affairs. The widespread desire among us to get rid of the name "Protestant" does not signify a fling at those who cherish Protestant principles in the present use of that word, but a desire to have our name truly represent the historical position of this Church.

In spite of the wide range of opinion which this Church permits, and which is in fact found among us, it is even laughably out of accord with fact to describe the general sentiment of Episcopalians as "Protestant." Without debating that matter, I venture to offer one practical proof. It would obviously be impossible for any gathering of "Protestants," in the modern sense of that term, to produce and adopt a book of Common Prayer which would not omit many elements in our Prayer Book—I mean those which have again and again been scorned as "Romish" by Protestant controversialists.

The present discussion of the change of name has received its bitter element chiefly from the East and from a very limited group of Churchmen—Churchmen who happen to represent a good deal of wealth. Allowing for some militant exceptions, those who are pleading for correction of our name are engaged in an educational campaign for the purpose of convincing the minority, but with no design of forcing the change until the minority have learned more correctly to interpret the movement and have had their fears of Romeward tendencies removed. The promoters of the change are accused of designing to force out the type of Churchmen to whom the adoption of the name "Protestant" was due. This is certainly a mistake. . . . It is exceedingly unlikely that any actual legislation on the subject will be forced thru next fall. Even if such a thing should occur, the change must be referred to the dioceses for consideration, and must be ratified in the exact terms of its original enactment at a second General Convention, three years hence, before it can go into effect. You can see how absurd scare headlines on the subject are.

In conclusion, let me say that a clearer assertion of our historical position—Catholic but not Roman—cannot justly afford cause of offense among our Protestant brethren of other Communions. Indeed, it does not in the slightest degree affect the strong movement among us toward a more friendly attitude and a clearer mutual understanding. And the motive for participating in the proposed World Conference is not to constrain Christians to conceal and to compromise their differences, but to ascertain their precise nature, and to deepen the spirit of brotherly love in the pursuit of truth. It should be evident, therefore, that a change of name which has the effect of making our position more clear should not be regarded by Protestants as otherwise than in line with the purpose of that Conference, or as a reason for lessened interest on their part in its success.

Professor of Dogmatic Theology, Western Theological Seminary.

A Charge of Cubism

It is worthy of remark that the Rev. G. Monroe Royce's article, "The Repudiation of a Church Name," appeared in THE INDEPENDENT a short time after the art exhibit of the "Cubists and Futurists." Mr. Royce evidently has been a close student of their methods and has applied them with such remarkable success to literature in the above-mentioned article that even those who have watched most carefully the rise and growth of the "Change of Name Movement" in the Episcopal Church fail to discover a single point of resemblance between the thing itself and Mr. Royce's representation of it.

The controversy rages around two words—Protestant and Catholic. Those who desire a "change of name" are all agreed that the name Protestant should disappear from the title page of the Prayer Book. Some would be content to let the matter drop there, or perhaps to insert the words "Holy Catholic Church" on the title page in such wise as to proclaim the Episcopal Church a part or portion thereof. Others would drop the "Episcopal" along with the "Protestant," and insert the name American Catholic where Protestant Episcopal now stands.

Now, why do all these people wish to rid the Prayer Book and the Church of the name Protestant?

Because they believe that Protestant is a name which speaks of strife and division and keeps alive the memory of past dissensions and hatreds; because it stands today for the centrifugal forces in religion, and because as applied to the Episcopal Church it is inaccurate and misleading.

Those who desire the adoption of the name American Catholic believe that it does truly describe this Church, that it will enable her to do her work at home and abroad more effectively, and that, in the long run, it will best subserve the interests of Christian unity.

They believe that, altho the name Catholic is generally and loosely applied to that Church which acknowledges the supremacy of the See of Rome—it is understood by intelligent people to be applicable to other

Churches, such as the Greek and Russian Churches and the Old Catholic Church; while the phrase "Holy Catholic Church" in the Apostles' Creed is a witness to all Christians as to the older, historic and accurate use of the word. They think, therefore, that any misunderstanding of that word would be short lived. The name American, moreover, limiting the word Catholic in the title, would save us from folly of claiming to be the whole Catholic Church of this country (nobody thinks of calling the Church "The Holy Catholic Church of America"—that is merely a "Cubist" impression), and would indicate clearly its position as a National Catholic Church, owing allegiance to no foreign ecclesiastic, and unhampered by alien traditions or foreign alliances.

Are these positions tenable? I think that they are. The Episcopal Church in her official documents reveals her Catholic character. She re-ordains Protestant ministers coming to her, and receives, without reordination, Roman or Greek Catholic priests. She ordains her deacons, priests and bishops not as "Episcopal" ministers, but as ministers of the Church of God. She confirms communicants of Protestant Churches before receiving them as her own communicants; she receives Roman and Greek Catholics without confirmation. Her accredited historians assert her continuity from the early ages of Christianity, and her true Catholicity. These things are usually passed by unnoticed in the arguments of those who desire the retention of the present name, for the very good reason that it is clearly absurd to call a Church of which these things are true, Protestant, except in the forgotten sense of non-Papal or anti-Papal.

Therefore, many of us are asking, "Why, when undoubted Protestants are shrinking from the use of the name and deploring its 'divisive' and subdivisive tendencies; why, when none of the genuine Protestant denominations think it necessary to parade the name in its title, save only the Methodist Protestants—who use the word in the sense of "pro*test*ant"—and the Moravians from whom we borrowed or stole the name Protestant Episcopal outright; why should we keep a name that misrepresents us, and, moreover, belongs of right to somebody else?"

"Why not," we ask, "take a name which tells what the Church is, a name which ought to make it the rallying ground for all Christians who, rejecting the infallibility of the individual, or of a single bishop, believe in the Church as the divinely created, divinely guided family of God, taught by His Spirit, and imparting His Life to men—a true and real Extension of the Incarnation?"

To these questions we receive answers such as that of Mr. Royce. The main issues are avoided. Etymological fancies, innuendoes, personalities, threats and reckless assertions are made to do duty in the place of arguments. There are but two things in Mr. Royce's paper which are worthy of serious consideration, and both tell against his own position. He refers to the Schism of '73. One might infer from his mysterious reference to it that it was caused by a Catholic uprising.

As a matter of fact, some clergymen—including a bishop—and some laymen, finding themselves unable to use certain un-Protestant phrases in the Prayer Book, and rebelling against the thoroly un-Protestant polity of the Church, were honest enough to secede. We respect them, and thank them for their testimony to the Catholic character of the Church. If, however, all who believed (and now believe) as they did, had been as sincere as they were, and had not tarried among the "flesh-pots," the name Protestant Episcopal would have gone from our Church long ago.

The second point which Mr. Royce makes against his own position is made in trying to show the great injustice in the method of voting in General Convention.

Those who are "stand-patters" should be the last to complain, since but for that method the "Round Table" resolution, dropping the word "Protestant" and inserting the words "Holy Catholic" on the title page of the Prayer Book, would have prevailed.

Is it quite "American" for Mr. Royce and his friends to cry out "unfair"—when they see possible defeat ahead—against rules by means of which they themselves have been victorious more than once?

Nevertheless these men do well to dislike this method of voting. It is a witness against their theories.

It may not appear democratic, yet, in the truest sense, I think it is. It is without doubt a witness to the Catholic character of our Church. In the Catholic family the diocese is the unit. The bishop of the smallest diocese and the bishop of the greatest diocese have equal rights and the representatives of the smallest diocese and the greatest stand on a footing of equality.

Here the weak and the strong, the rich and poor members of the family are of the same importance. That is the Catholic theory, and it is, I believe, truly democratic and truly Christian.

It is because we are a Catholic Church that we have inherited this method.

Those who wish us to appear a Protes-

tant sect, do well to dislike it. Their difficulty really is that they cannot understand the spirit of our Church, and the reason is plain. Their minds are Cubical and not logical. They do not possess the hight and breadth of the thing that is "square," but only the distinguishing quality of the cube—thickness or density. "Which things are an allegory."

Two Ways of Reading

How to Cultivate Eye and Ear for Different Kinds of Literature

By Harry Lyman Koopman

[Since his graduation from Colby College Mr. Koopman has been connected with the libraries of several universities and colleges. He has been librarian of Brown University since 1893. He serves, too, on the advisory council of the Simplified Spelling Board. He has published both verse and essays.—EDITOR.]

Looked at from the mechanical rather than from the intellectual side, reading includes two opposite methods, corresponding to the two great divisions of literature itself. Charles Lamb indicated this twofold character of printed matter when he divided it into "books" and "books that are not books," showing by his illustration of the latter class, catalogs, that he meant by "books that are not books" those that contain mere information. De Quincey popularized, tho he did not originate, the classic names for the two divisions—the literature of knowledge and the literature of power. Now we find that reading on its mechanical side actually has, as theoretically we should expect it to have, two distinct methods of procedure in attacking these two classes of books. The one is the eye method; the other is the eye method plus motor and auditory associations.

When we first learn to read we identify a printed word with a muscular effort to produce a sound that stands for a certain meaning, and as long as we practise reading aloud this association continues. Thus we make our passage from print to meaning in three flights, stopping at speech and sound on the way between. Later, when we have ceased to read aloud, we may become conscious of only a single flight, utterance and the sound being neglected. So, in rapid reading we exclude not only all matter on the page that does not pertain to the subject in hand, but also the words themselves as sounds or even separate carriers of meaning. This method, assuming that one can command the art of carrying it out, may be called the ideal one to use in the case of the "biblia abiblia," books of mere information. Here is no question of tracing the words with the finger, or of moving the lips, much less of spelling the words. The recognition is instant, and it is accompanied by no conscious motor or auditory reactions, moreover it is a recognition of meaning rather than of form or of sound thru form.

Very different is our reading process when we have before us a "book that is a book," a copy of *Paradise Lost*, for instance. Here we are interested in far more than the meaning, important as that may be. The form is here a part of the substance. If we open to the fifth book of the poem and read the first fifty-five lines beginning "Hail, holy light," we may be said not really to have read them at all if we have read them only as we read a paragraph in a dictionary. This is indeed a case that frankly calls for reading aloud, but as this is not always feasible, we must be able to read silently, it may be without motion of the lips, yet with inward hearing of the vocal organ music that is pouring from the page before us. This inward ear is a familiar possession of musicians, who, with a score before them, can hear and enjoy, criticise and admire the music which it records. It should be equally at the command of us all when we turn from books that instruct to books that inspire, whether prose or poetry. This power is often curiously lacking, particularly in college students, who have

been called upon, during all their school life, almost exclusively for the results of eye reading. Such a student, when asked to read aloud a simple paragraph from a newspaper, will read it no better than he would when ten years old, if indeed so well. Words that are in merely literary use he is very apt to mispronounce, showing that he had allowed their printed appearance to develop false motor reactions, or none at all, and that when he was suddenly called upon for a pronunciation the false one came to the surface, or he snatched at what the Germans call the "first best." Moreover, not only will he be faulty on the low level of mere pronunciation, but his voice will be quite lacking in all interpretative skill, a proof that his silent reading had been accompanied by no motor reactions upon this higher level. The demands of modern college courses for taking lecture notes at high pressure and for doing a large amount of collateral reading, also under high pressure, with a frequent demand for summaries, mental or written, all put a premium upon exclusive eye reading. This is, of course, a most valuable acquisition, and, as a tool or knack of the scholar or literary worker, can hardly be overestimated. Ability to use books is almost identical with the ability to read them with the greatest possible rapidity and with the least possible intrusion between the reader's mind and the writer's thought. So, the extent to which a reader can achieve pure eye reading is almost the measure of his mastery of books; and, if the student comes out of college with this attainment in a high degree, he has achieved a large portion of his equipment for the intellectual life. But this power is often accompanied by a serious defect, the inability to appreciate the art element in literature. So thoroly has the boy's literary training been ocular that, tho he has read Homer and Sophocles, Vergil and Horace, to say nothing of the English and other modern classics, they have never meant to him anything auditory, there never broke on his ears what Andrew Lang calls "the surge and thunder of the Odyssey," or what Tennyson calls Vergil's "ocean roll of rhythm." To such a student Spenser's *Faerie Queene* is a piece of delicious fancy and quaint spelling; it has never occurred to him that it is one of the greatest word symphonies in all literature. In fact, he would be quite shocked at the idea of respelling Spenser to bring out the sound; and you may safely count on finding him in the ranks that oppose spelling reform as a tampering with the language, for in some things none are so blind as those who cannot hear.

We seem to have worked out two incompatible demands; but in practice the mind seems able to satisfy both, and not by a compromise between the two methods, but in letting each work its perfect work. The eye reader need not in his informational reading cultivate motor and auditory associations in order that he may have them when he wants them, nor need the voice-and-ear reader slur his literary reading in order to gain facility in reading for information; but rather they should recognize the two great divisions of printed matter and cutivate for each the style of reading most appropriate to it to the highest possible degree of perfection. Success seems to lie in this direction rather than in any golden mean, which in this case would be rather a falling between two stools. What we really need for successful reading is two taps in our brains, one of which we can turn on with or without the other. Then, even if nine-tenths of our reading is for substance, the precious one-tenth will not be cheated of its rights, neither will it intrude to hinder our reading of the commonplace nine-tenths.

If the question is asked how we are to attain this twofold skill, the answer will vary according to the psychological disposition of the reader. In any case we should remember that it is no easy task to break up long established habits or to form new habits involving complicated associations, especially as we grow older. Let us suppose that our first case is one of exclusion, that we have to advise a voice-and-ear reader how to overcome his auditory and motor associations. The first thing for him to do is to keep his lips shut and to force his associations of speech and hearing to go on "up in his head," as the phrase is. He should, of course, practise on material that does not invite to such associations, like pages of statistics, descrip-

tions of machinery and mathematical discussions. He should also, in easily comprehended matter, try to read so fast as to outstrip his troublesome accompaniments. There is another type of association, the mental, consisting of suggested pictures or thoughts, with which it is not our present business to deal; this also tends to slow up one's reading, but it may greatly enrich it, and it should not be suppressed, except in hasty reference reading and otherwise as far as it tends to become a distraction.

But suppose our help is asked by some one who is convinced that he has been missing a great and essential element of literature, an eye reader who wishes to acquire motor and auditory associations. His case is simpler if not easier. His cue is to open his lips, and where possible to read aloud. He should practise upon the most sonorous types of literature, the violin of Swinburne, the 'cello of Webster. He should make it a point to hear literature well read—if he can find it—and to read it over silently to himself, trying to hear in memory the voice of the reader. It will be a great advantage if he can hear the Bible well read, for this represents the music of both prose and poetry; but it will not pay him to be too critical; and, of course, so far as the associations are concerned, poor ones will work as well as good, only they will not be so pleasant. It will be particularly useful for him to practise silently at reading aloud as if he were playing on a dumb piano. But, when the eye reader has taken on inward hearing, how can he, in reading for information, shut out his inner voice and attend only to the meaning before him? He will very likely do so without difficulty; but if he finds himself landed in confusion, he has only to submit to the inhibitory training of the ear reader, without the need for the eye training undergone by the latter.

The great point for the reader to keep always in mind is that the problem has been solved a thousand times, and can be solved more or less perfectly by every one. The most successful solution awaits him who can most perfectly perform the two opposite acts; if he needs but one facility, he need cultivate but one, but most readers need both and cannot afford to let either interfere with the other. When we consider the infinite pains that the artist or the sportsman takes to acquire skill of hand, which is really skill of brain, we ought not to expect that we shall master the mechanics of reading in a week or a year; rather should we expect slow progress and find encouragement in slight gains. For the problem may be solved by any one who will take himself in hand and never give up short of success, no matter how slow to learn he finds his pupil.

Providence, R. I.

The Apartment House

By Joyce Kilmer

Severe against the pleasant arc of sky
  The great stone box is cruelly displayed.
  The street becomes more dreary from its shade,
And vagrant breezes touch its wall and die.
Here sullen convicts in their chains might lie,
  Or slaves toil dumbly at some dreary trade.
  How worse than folly is their labor made
Who cleft the rocks that this might rise on high!

Yet, as I look, I see a woman's face
  Gleam from a window high above the street.
This is a house of homes, a sacred place,
  By human passion made divinely sweet.
How all the building thrills with sudden grace
  Beneath the magic of Love's golden feet!

Mahwah, N. J.

The Last Day of the Paint Creek Court Martial

By Cora Older

[The coal-mine strikes in Western Virginia are among the most serious known in American history; and yet the public has known very little about them, because the sources of information have been in the hands of the operators. It has been also notable for the fact that a woman eighty years old, Mother Jones, has been the most prominent leader. There has been violence on both sides, and as a matter of course the militia were called in. One man having been killed by strikers, fifty strikers and their leaders were arrested or convicted by court martial. Governor Hatfield liberated all but eight leaders, including Mother Jones, who are still imprisoned. The strikes have been called off and the miners have gained the recognition of their union. The latest news is of the suppression of the leading Socialist paper and the arrest of the editors. The quick impressions of this article are those of the wife of Fremont Older, the fighting editor of the San Francisco *Bulletin*. They are the impressions of a woman who comes from a state where popular government has been adopted to one where, without a jury, a military court can jeopardize the lives of its citizens. These are the impressions of a California woman—a radical—of a day in West Virginia.—EDITOR.]

Mother Jones and forty-eight men were on trial before the Military Court at Paint Creek Junction, W. Va. They were charged with conspiracy to murder Fred Bobbitt, the bookkeeper of a mining company, in the "battle of Mucklow," which occurred on February 10.

On February 7 Quin Morton, the largest operator in the Kanawha Valley, the sheriff and some guards drove the Chesapeake and Ohio armored special train carrying gatling guns thru Holly Grove, where strikers with their families lived. The men on the train opened fire with rifles and gatling guns, killing one striker, Francesco Estop, and wounding a woman. No one has as yet been arrested for what in West Virginia is called the "shooting-up of Holly Grove." Three days later fifty or sixty strikers set out to capture a gatling gun from the guards near Mucklow. The strikers and guards fought. Fred Bobbitt was killed and another man, Vance, wounded. After the battle of Mucklow scores of strikers and sympathizers were arrested. Martial law was declared. Mother Jones and forty-eight men were brought before the military commission charged with murder.

I reached Paint Creek Junction the last day of the trial. The moment I arrived I realized that the strike was no longer a strike; it was war. Soldiers guarding bull pens carried Winchesters on their shoulders. Gatling guns thrust their noses out of doors. A bright flag floated over all. It was civilized civil war.

Court was being held in Odd Fellows' Hall, the largest room in town. The hall occupies the second floor of a two-and-a-half-story green building, in the basement of which is a general merchandise store. The doors of the stairway leading to the abode of justice were guarded with Winchesters. Upstairs in a room filled with empty benches, a stack of rifles at his back, emblems of fraternity at his side, alone at a table sat Justice in the person of Provost Marshal Bond. The provost marshal was not only the ruler of Paint Creek Junction; he was the Associated Press correspondent. He had the divine gift of creating darkness. The outside world does not know what went on in the Kanawha Valley during the strike. The provost marshal was so weighted with authority that he could not rise. I was glad he could speak.

"The trial will go on at two."

Two days previous, Judge Littlepage of Charleston had issued a writ of prohibition enjoining the court from proceeding with the trial on the ground that a military court had no jurisdiction over civilians. The judge's decision was not to be handed down for two hours, but already the provost marshal knew its contents. I suspected that he was a mind reader.

He was. At two o'clock the telephone bell rang. The judge had dissolved his own writ of prohibition.

Section 12, Article 3, of the constitution of West Virginia says:

"The military shall be subordinate to the civil power, and no citizen, unless engaged in the military service of the state, shall be tried or punished by a military court for any offense that is cognizable by the civil courts of the state."

Judge Littlepage's decision suspended the constitution. The prisoners were sent for.

While waiting for the court to be called to order, my acquaintance was sought by a dark, oriental looking young man, whose mind seemed filled with underground passages and trap doors. He had a noiseless step, an enchanting foreign voice and an ingratiating manner. He was the "Dearest Friend of Everybody," the provost marshal, the president of the military court, a New York reporter and myself. He explained to the reporter the rifles stacked in the room. He fetched me water and a newspaper. The judges in uniform took their seats round the table covered with blue military blankets. "Everybody's Dearest Friend" was not far from the judges. Apparently he had no authority; and yet he was all authority. I wondered what was his occupation.

There was tramping of feet upstairs. The prisoners were coming. A man in uniform opened the door. The first accused murderer appeared. He was a pale, fair boy of sixteen, with feverish eyes and lips. Forty prisoners followed him. For the most part they were under twenty-five. Few miners in West Virginia live to be old. In boyhood their backs are bent by crawling thru dark holes to work; their cheeks are chalky, as if they lived in cellars; their eyes blink in sunlight. Two score human bats filled the benches and faced the well-fed, flabby, white-handed, confident man, their judge.

Presently there came into the court room the rebels among the prisoners, the six who refused to acknowledge the jurisdiction of the court by a plea. Paulsen and Batley, two rugged organizers for the United Mine Workers, appeared first. After them was Parsons, a fiery-eyed local Socialist speaker. Tall, lank John W. Brown, the best known Socialist soap-box orator in the United States, and C. H. Boswell, the editor of the *Charleston Labor Argus,* entered together. Boswell, the man most hated by the mine operators in West Virginia, has the eyes and mouth of a girl.

Alone and last came Mother Jones, aged eighty, the strongest man of them all. Yet Mother Jones wears a neat feminine black alpaca dress and has prettily curled white hair. She sat in the center of the front row of benches, her keen, alert eyes losing nothing that transpired. Double the age of any man present, so splendidly has she conquered time that hers seemed the most alert mind in the room.

The attorneys for the defense, Littlepage and Matheny, employed by relatives of the forty defendants, and two officers appointed by the military court, sat at the table with the judges. The prosecution tried first to establish that Mother Jones, in speeches made before the "battle of Mucklow," fomented the trouble ending in the death of Bobbitt. A witness was called whose memory had been refreshed, he said, by consulting a notebook. He began to quote Mother Jones' speeches. I expected something blood-curdling. Mother Jones was mild as a Progressive. In comparison, at times President Wilson almost seems an undesirable citizen. In West Virginia, for his speech about hanging disturbers of public credit, he would find himself in a pen.

Another witness freely gave hearsay testimony. The attorneys for the defendants got to their feet in protest. The judge advocate answered: "Oh, let it all go in. It will save time. This court isn't going to pay attention to hearsay testimony."

The attorneys for the defense objected that a higher court might be prejudiced by hearsay testimony. The court overruled the objection. No one seemed to think anything unusual had occurred.

In reading the records of the case, I found admission made by a mining operator that he had erected machine guns on his property. This statement had not gone to the outside world. I offered it to the New York reporter as news. "No," he said, shaking his head; "the real story down here is that the mine owners are downtrodden." He took the next train. His paper gave the discovery to the world—the mine owners are downtrodden!

During the recess I had a few minutes' conversation with Mother Jones. Her eighty years were as nothing—she became a rollicking, irrepressible girl. She liked everyone, even the military court. She told me she was not against the

judges, but their jobs. As for the young officer appointed against her wishes as her counsel, like an affectionate mother she said, "He's a nice fellow, only, you know, he's not my attorney." She turned to one of the judges who was passing: "Don't dare find against me. If you do, I'll——" she shook her fist with a touch of revealing coquetry.

When I returned for the evening session, already a crowd had gathered in the street before the court room. Prisoners' wives with shawls over their heads, leading children, had walked a mile or more. They knew there was no chance to enter the court room, but they stood in the streets, hoping to catch echoes of speeches thru the open windows. One woman flung at a soldier: "Scabs at a dollar and a half a day." In West Virginia, women fight side by side with men.

Eight or ten sympathizers of the prisoners had already filled the benches in the gas-lit hall. "Everybody's Dearest Friend" had preceded me. Again he gave me water and a newspaper. The prisoners filed into the room.

"A bad-looking lot of fellows," he offered.

"Badly dressed," I answered.

"No, bad men. You ought to know what these miners are. If you had seen and heard what I have."

A sympathizer with the strikers seated on a bench behind me touched my arm. "Do you know you are talking with Smith, a Burns detective?"

Mr. Smith conferred with the provost marshal, also Associated Press correspondent. Word was sent to the judges' table. The judge advocate rose and advised all women except me to leave the court room. The women obeyed. A smile played round the lips of Mr. Smith, flirted in the provost marshal's eyes, and lighted up the table where the judges sat.

The smile died when M. F. Matheny, an attorney for the defendants, rose and said: "These women are friends of the prisoners. They are as much interested in the trial as the men themselves. This man Smith has no right in the court room. He should be excluded if the women are. The court has ruled that no witness after testifying shall remain."

The court blithely overruled itself and then went on dealing out justice to "criminals." I was proud to know Mr. Smith. He had invented a new misdemeanor; to mention his name was *lèse-Smith.* This great court he dominated. William J. Burns was his visible employer. I speculated much about his invisible employer.

I was not to speculate long. An attorney's speech disclosed that Smith, the gentle overlord of the room, was in the employ of the mine operators. The attorney also revealed that Smith was an excellent detective. He had gone to the strikers, pretended to be in need, had eaten their bread when they had only strike rations. On one occasion his life had been saved by one of the prisoners. The detective had recorded the many violent words uttered and had become chief witness for the state.

While the first speeches were being made, Mr. Smith, the mine operators' representative, unrebuked by the court, noisily used the telephone. Apparently the judges and Mr. Smith agreed that it was a noble duty to interrupt a dull speech. The prisoners watched Smith with more perturbation than they followed the judges. As the hour grew late, they moistened their lips; their eyes were glassy; even Mother Jones seemed about to faint. Back of Smith was the specter, the guard system, peonage, gatling guns.

Early in the evening the speeches lacked not only power, but sincerity and vision. Yet these last hours were momentous. Not Mother Jones and forty-eight men were on trial, but liberty. For a thousand years civilians had had the right to jury trial. If forty-nine persons could be denied that right, it was in the minds of all that the end of strikes had come and industrial war had begun.

Until M. F. Matheny, of Charleston, spoke, it seemed that the case must go to the judges not only undefended but unargued. He talked briefly of the testimony, which consisted largely of the statement of Smith. He passed quickly to the causes back of the trial, to the crime of low wages, bad living conditions, peonage, the brutal guard system. Mr. Matheny insisted that the real case had never been before the judges. It could never be tried till the causes that led to the murder were brought into the

court room. The death of Bobbitt came from war, industrial war. Armed bands of men had been going up and down the creeks. So long as there was industrial injustice, there would be industrial war. The war was not in the North, South, East or West, but in the mountains of West Virginia. The judges might think they could bring about peace by sending the defendants to prison. They couldn't. Somewhere else the war would break out. The case would never be settled till it was settled right.

The judge advocate, a tall, slim-necked man, with a high, intellectual head, replied. He pinned his faith to facts. Mr. Matheny was somewhat comic because he talked about causes. What had causes to do with murder? The judge advocate, wearing the uniform that compelled him as a supreme duty to be ready to take life, thought that murder was murder. The judge advocate made an excellent plea for the widow of Bobbitt, and warned the court against confusing causes with facts. At midnight the case went to the judges. The Associated Press correspondent was the only writer present to record what had happened. He was an officer of the court. The longest account of the last day of the trial was a third of a column published the next morning in a Charleston paper.

We followed the prisoners downstairs. A crowd of friends and sympathizers still waited in the dark street. The women ejected from the court room had stood five hours to hear the result. They seemed to consider their ejection a martial law joke, a part of the bitter industrial fight. They waved their hands at the prisoners as they passed on their way to the bull pens. Then the women and children set out on foot for the neighboring towns.

"Halt!" called a picket, flashing a lantern. "Who goes there?"

The women gave their names.

"Advance and be recognized!"

Charleston, West Virginia.

Novel Lawmaking in California

What the Legislature Has Been Doing in Its First Bifurcated Session

By James A. B. Scherer, Ph.D., LL.D.,

President of Throop Polytechnic Institute.

It is nothing against it that there is no other like it. Neither is there any other statesman like the author of this novel plan of a divided, or "bifurcated," legislature—Senator Caminetti of Amador, the indefatigable and fiery, but able and lovable leader of the Democratic minority in the California Senate. He can evolve ideas out of his inner consciousness with the facility of a spider spinning silk, and weave them into the fabric of the code with a deftness that defies all complications. This is the first time that he or the rest of the world has seen his novel legislative plan in action, and he says that it is good. Caminetti proposed it as a constitutional amendment two years ago, and the people promptly ratified it, together with a score of other amendments that really accomplished, under Governor Johnson, a wholesale political revolution: including the initiative, referendum and recall, a new system of local government, an effective railway commission, and the conferring of authority on future legislatures to create an employers' compensation act.

The Caminetti plan is very simple. It provides that the legislature shall convene biennially for the month to January to receive bills, take a recess of another month, and then reconvene for the consideration and passage of bills, it being impossible to introduce new measures into this second convention except under stringent restrictions. The object is publicity. During the recess the legislators go home and study, the searchlight of the press is turned on, and the people are informed as to proposed laws. Thruout the second half of the session there is a lobby that helps rather than hinders,

because it must work in the open, and cannot introduce "rush" measures. Any bill that runs such a gauntlet ought to be fairly representative, whether it is wise and needful or not; for there is the amplest opportunity to ferret out "jokers" and expose all the well-intended fallacies of radicalism.

That is the way the plan was intended to work, and that is the way it is working. If there has been more publicity than ever, it is because this publicity was provided for and invited. If "freaks" have been widely advertised, it is because of the perfect machinery for their exposure. And the larger lobby is present to retard, rather than advance, dangerous measures. That is my opinion after spending the month of April at Sacramento.

Some very freakish bills were introduced: one for regulating the size of canary-bird cages, another for regulating the length of hotel bed-sheets. Any elongated person who has ever been stretched upon a procrustean bed in the average village hotel and then tried to cover up his neck and his feet at the same time must sympathize with the hundreds of "drummers" who deluged legislators with letters in behalf of the sheet bill, but he may nevertheless question whether a state legislature had not better "resolve that this bill do sleep." That is what the committees have done with a large majority of measures.

Out of the live and restless measures, however, a few may be selected for discussion. Whether they seem freakish or not will depend upon the personal point of view. To me the most amazing thing that happened was the resuscitation of a radical eugenics bill after it had been put to sleep by vote of the assembly itself. This bill, formulated and urged by women, orginally provided that both parties to any proposed marriage should undergo successful examination to show freedom from certain specific diseases in order to obtain the marriage license. By request of assemblymen themselves it was amended to apply to men only, and properly so, when one duly considers; whereupon it was promptly rejected by a vote of 34 to 36, on the ground of discrimination of sex! However, the health lobby clenched its most resolute jaw, secured a speedy reconsideration, exposed the inconsistency of negative voters, and the other day the bill went thru the assembly by a vote of 50 to 21. It must still face the senate, but the chances there are far better than they seemed to be in the other house. It took clean grit to pass such a bill, and a very high order of intelligence. The act not only requires a health certificate for marriage, but also provides a "division of marriage and child welfare" in the bureau of vital statistics. The passage of another bill, providing for the asexualization of certain criminals and lunatics, seems assured.

Great interest was shown in the question of penitentiaries and prisons. An elaborate investigation proved that the administration of San Quentin and Folsom has been made much more humane within the last few years, without sacrifice of the necessary discipline. At San Quentin the use of the strait-jacket has decreased from 7911 hours on 270 prisoners in 1905 to 28⅔ hours on 7 convicts in 1912, while the number of paroles has increased from 29 to 275 during the same period. Equal improvement is recorded at Folsom. Nevertheless it must be apparent to thoughtful observers that our treatment of criminals, even in relatively good prisons, is still itself criminal, tending to brutalize and harden the inmates instead of to help them. It is based on the single principle of protecting society thru exclusion, instead of combining with this a scientific effort to reclaim the defective.

A step in this direction was taken by the legislature in passing the indeterminate sentence act, providing that in all convictions for crimes punishable by fine or imprisonment the court shall not fix the exact period of sentence. This is to be determined by a commission within the limits of the minimum and maximum periods provided by law, on the basis of the prisoner's behavior. A judge is but human, and he stands in the common danger of prejudice and partiality and losing his sensitiveness thru constant routine. It is enough for him to secure an impartial trial and pronounce sentence, without fixing the exact period of punishment. From caprice or overwork or a bad breakfast he may, on the im-

pulse of the moment, determine to load a trivial offender of unprepossessing appearance with a ten-year sentence instead of six months, whereas a guiltier culprit of more delicate demeanor may get off with the minimum. Under the new California system the ultimate sentence will be determined by a commission on the basis of the prisoner's good behavior, thus providing a powerful incentive for improvement. It is to be noted that the most serious crimes are not included in the operation of the act.

A sweeping measure for moral reform, introduced by a new senator for San Francisco, and already signed by the Governor, is popularly known as the Red Light Abatement Bill. It declares all places of lewdness to be nuisances, and empowers any citizen to secure temporary injunction against them, altho the court will assess costs against the citizen if it discovers no reasonable ground for the action. Should existence of the nuisance be established, an order of abatement is issued, directing the sale of all furnishings, and the effectual closing of the building itself against all uses for one year, except—in some cases—under heavy bond that it shall not be employed further for lewdness. The Red Light "moralists," or vice segregationists, are already busy with the circulation of referendum petitions against this measure of drastic reform, while the purveyors of vice in certain communities are literally taking to the water—in house-boats, on the theory that the state cannot interfere with the federal freedom of rivers and harbors! Another measure of moral reform is designed to prohibit prize fighting.

Besides these bills for the protection and conservation of morals, various measures for the conservation of natural resources met with determined opposition in the lobbies. California has suffered more from the wasteful exploitation of its public domain than any other state in the nation, has most at stake even at this eleventh hour of opportunity. A forestry board and a water board, having large powers and effective administrative machinery, are proposed, together with measures for the conservation of the soil. Paid representatives of capital were constantly present in the lobby, not necessarily for the exercise of improper influence, but in order to protect investment and ward off the menace of radicalism.

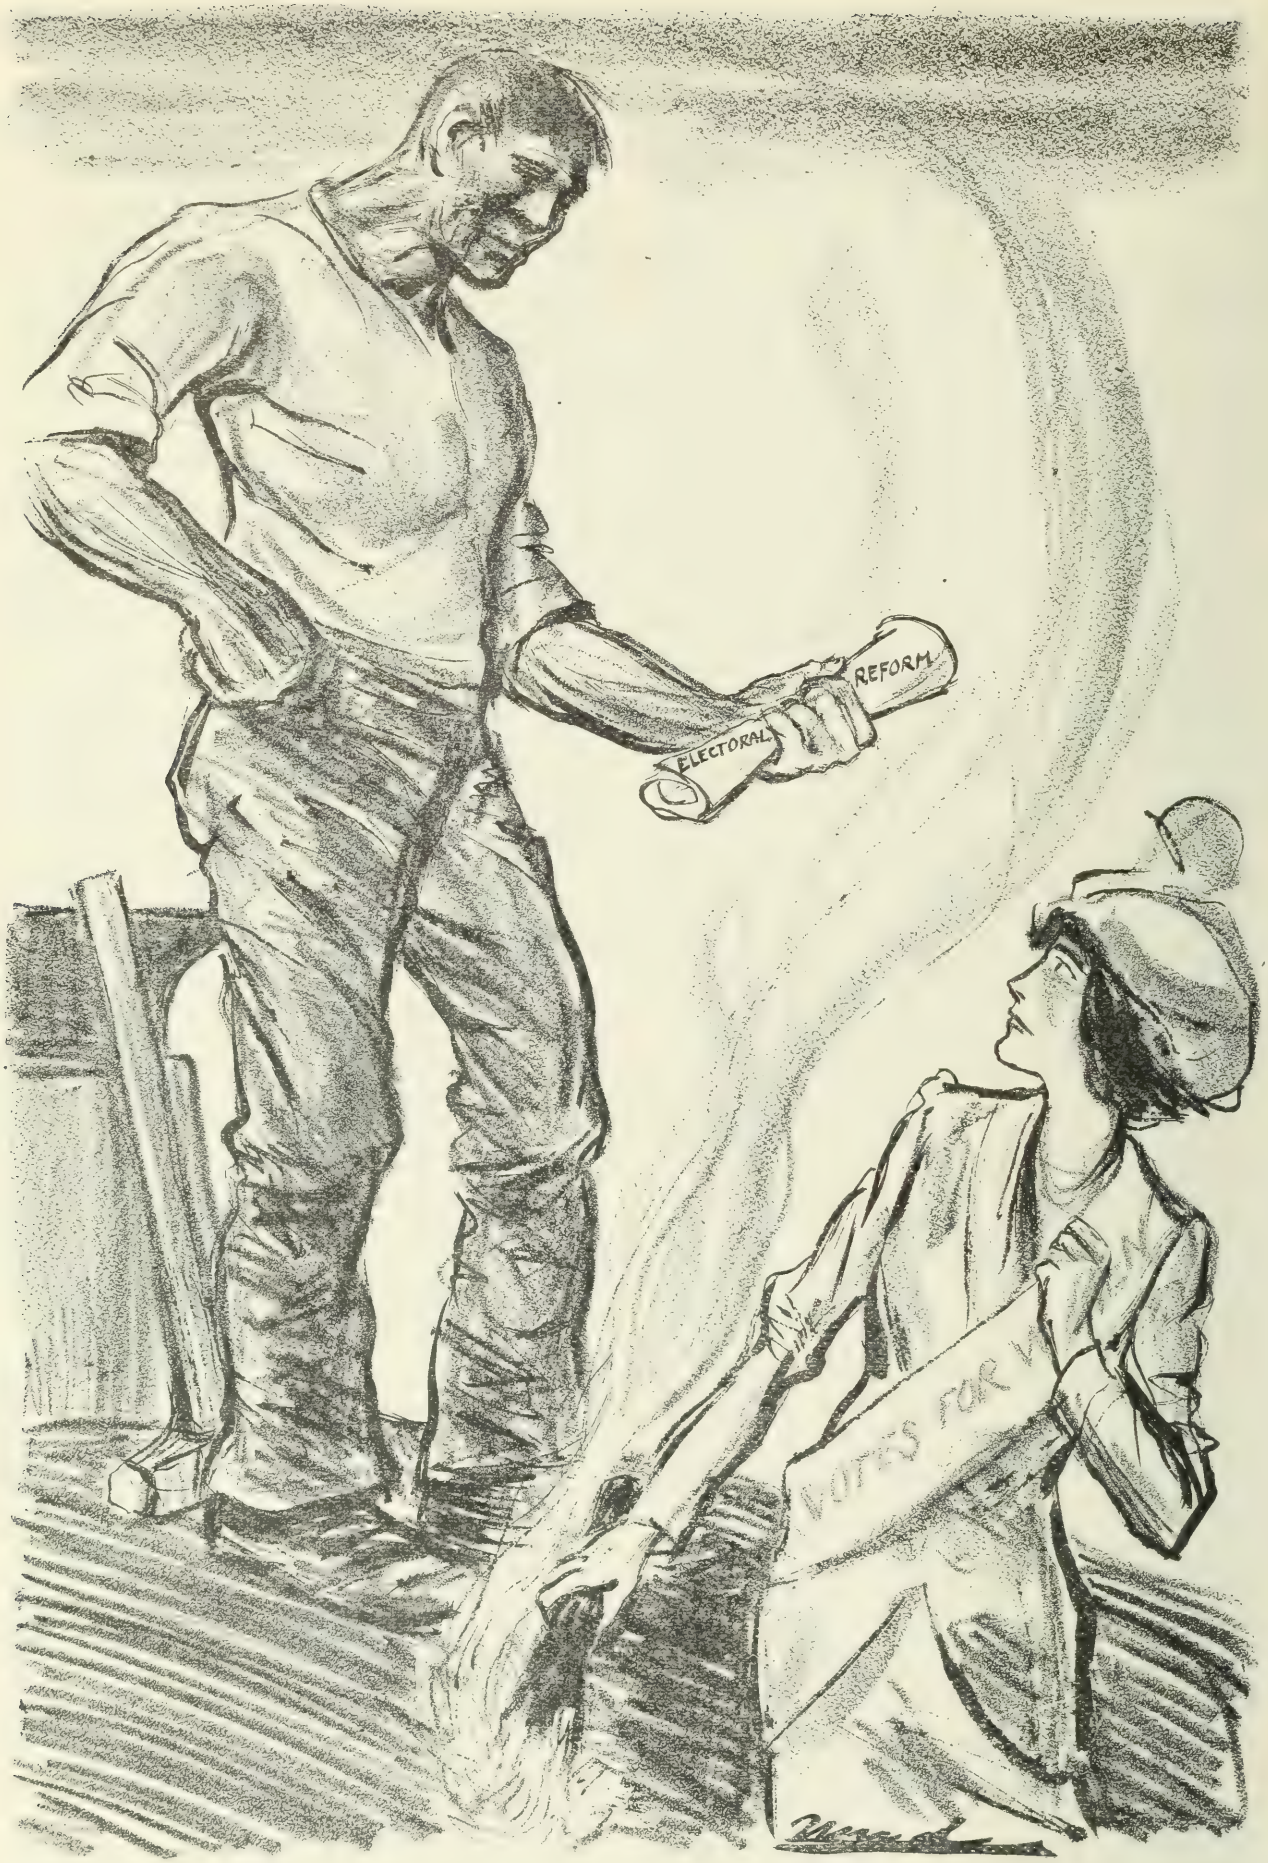
Labor was also well represented in the lobbies, impressively and otherwise. Carl Brown, son-in-law of the once famous Coxey, marched an army of twenty unemployed men from San Francisco to Sacramento, with picturesque tattered banners, and addressed a curious audience one night in the palatial senate chamber. His followers distributed hand-bills in the capitol grounds, demanding "the immediate abolition of poverty, hunger and decay." Indeed, Brown got as far as to secure the introduction of a measure "for the abolishment of poverty, providing for the appointment of a commission to receive contributions, and a commissioner for the abolition of poverty to serve without pay," but authorized to employ a clerk or clerks at $4 a day each. "He shall carry out the purpose of this act, which is to secure to every citizen his inalienable right, which is to eat, to work, and to be recompensed for enforced idleness." This bill has not passed.

Strangely enough, organized labor combated measures introduced for the benefit of workers, such as the cement bill and the minimum wage bill, believing that effective labor organization may be impaired by legislative regulation; while the minimum wage bill meets with the further objection that a minimum wage would tend to become the standard wage. The cement bill, which sought to protect stevedores from injurious inhalation in the holds of ships, by requiring the use of dustless containers, as in Europe, was stubbornly fought by labor interests and defeated.

The alien land bill, which has received the attention of the world, has its origin in the demands of labor organizations, represented chiefly by the Asiatic Exclusion League, with Olaf A. Tveitmoe as president. Secondary support comes from certain isolated communities where the Japanese own large tracts of land and have Eurasian children, thus introducing a new race problem. The third influence in favor of an alien land bill directed chiefly against "Mongolians" comes from those imaginative persons who foresee, in spite of the Panama Canal, the orientalization of the Pacific

Coast and the consummation of a gigantic "yellow peril."

But there is strong opposition in California to discriminatory legislation, not only on the part of commercial interests —such as banks representing British investments, and the directors of the San Francisco Exposition—but also on the part of many fair-minded communities. My own city, for example, has conveyed to the Legislature its strong disapproval of any measure directed chiefly or exclusively against Japanese.



Here is the crux of the matter. The Legislature is between the horns of a dilemma. The "square deal" people unite with the Federal Government and the Japanese in demanding a non-discriminatory measure or none at all. An impartial enactment, directed against all aliens alike, incurs the hostility of the banks in behalf of large British and European investments. Between these two horns the Legislature must almost certainly fall. It is clear to my judgment that if Mr. Bryan had not come to California the Legislature in the final issue would have passed either an impartial measure or none at all, and more likely the latter. Probably the time will come when the state will deny to all non-citizens the right of unqualified land tenure. It must not seek to discriminate, however, by taking advantage of the phrase *ineligible to citizenship,* any more than Congress in the case of that other convenient Federal statute which permits only American vessels to carry our coastwise trade. The two casuistries are exactly alike. Some Congressmen say that the bill granting free tolls to vessels carrying coastwise trade thru the canal does not discriminate against England, because English vessels are already ineligible to carry coastwise trade. Some California legislators say that the Birdsall bill does not discriminate against Japan because Japanese, as "Mongolians," are ineligible to citizenship by Federal statute. Both measures are discriminatory; both are tainted with subterfuge. You cannot get something for nothing. If California wants an alien land law it must pay the price and forego European investments.

There is, however, a deal of buncombe on the other side—notoriously in the Japanese claim that their Government permits aliens to hold realty. The Imperial Diet in 1910 passed an ordinance declaring that aliens may hold land in Japan provided the Emperor promulgates the ordinance (which has not yet been done); and provided that, in the case of an individual, he be actually resident during the period of ownership; provided further, that in the case of corporations the Home Secretary must specifically approve; that the nation where the alien or aliens may hold citizenship grants Japanese the right to hold land; that permission shall not in any case extend to the Hokkaido, Formosa or Saghalien (the only places where there is any room); that permission shall not apply to any district which may at any time be imperially proclaimed as necessary for the national defense; and finally, that in case of the violation of any of the terms of this many-headed law, the property shall escheat to the state.

There are 96,000 farmers in California, of whom 630 are Japanese. The coming of thousands of Europeans after the Canal is opened will turn this mountain of "orientalization" into a mole hill —an aspect which it would present now except for the legislative influence of certain groups of organized labor, backed by three or four farming communities with a real problem. Meanwhile it is well for Californians to remember that upon us especially rests the obligation of fair play to Japan, since it was for the avowed benefit of this state that President Fillmore sent Commodore Perry to Yedo just sixty years ago and forced open the channels of intercourse. It seems to me bad grace for California to give biennial bother to the Government on account of Japanese intercourse, because the Government forced the Japanese people, against their will, into terms of trade and comity with us, for California's express benefit and betterment.*

BELGIAN STRIKER TO BRITISH MILITANT: "*I* wanted to show I deserved a vote."

("Nothing has been more remarkable during the Belgian suffrage strike than the good order maintained." "The damage to property caused by militant suffragets during the last three months exceeds five million dollars."—*Cable Dispatches.*)

THE NEW BOOKS

The Human Slaughter House

The Human Slaughter House, in its English translation, makes a book of but 97 pages.* Yet it is one of the most remarkable and powerful indictments of war ever written. In realism it ranks with Zola's *The Downfall.* In its appeal to the conscience of mankind it can only be compared with Baroness von Suttner's masterpiece, *Lay Down Your Arms.*

The author is a school master in Hamburg, Germany. Until last year he was unknown to the world. He awoke overnight, however, to find himself famous. As a schoolmaster in the Fatherland is primarily a state official, one can imagine the paradox of such a man daring to strip war of its pomp and circumstance. Naturally he was "relieved" of his duties. Tho he has since been reinstated, he has continued until the present moment to be the object of a most vehement attack by the German press. "A peril to the public safety," "an hysterical neuropath," "a morbid phantasy," are only a few of the milder epithets applied to him.

Of course, the public promptly responded as it always does in such cases. Over one hundred thousand copies of the book have been sold in Germany, and it is being translated into eight foreign languages.

The Human Slaughter House is a description of the going to war, the fighting, the death and the resurrection of a common soldier, recorded by himself. The main purpose is to show that there is no such thing in modern warfare as a soldier's glorious death on the field of honor. "We can no longer go on pretending that war is what it used to be. . . . War today is nothing but senseless automatic slaughter by machinery. . . . We are being hustled from life to death by experts—by mechanicians. And just as they turn out buttons and pins by wholesale methods of production, so they are now turning out the crippled and dead by machinery."

The Human Slaughter House is a photograph of Hell, inspired of Heaven. It cannot be adequately reviewed. It must be read. HAMILTON HOLT.

**The Human Slaughter House.* By Wilhelm Lamszus. New York: F. A. Stokes & Co. Fifty cents.

M. Rémy de Gourmont†

A contributor to one of last fall's issues of THE INDEPENDENT did M. Rémy de Gourmont a great wrong. In writing of Anatole France this contributor said: "He is not only the complete nihilist; he is, also, of all living authors, the most delicious and the most sterile." M. France remains the most delicious; but M. de Gourmont incontestably transcends the other in sterility.

For France's irony is certainly purging and—at times—almost tonic. The atmosphere in M. de Gourmont's pagan cell is closer, laden with heavier perfumes, in all ways more equivocal. The Latin authors on his bookshelves are all late-Latin. And there is no humor in his echoes of the literary decadence of all ages, tho there is the same deadly nihilism that one finds in Anatole France. Finally, the deity to whom one is introduced in *A Night in the Luxembourg,* translated from De Gourmont's French by Arthur Ransome and issued by a Boston publisher, is much more dilettante than godhead. He hasn't even the courage of his bad ways, but fumbles at evil counsel as a country minister might in giving good advice to a summer colony communicant.

A Night in the Luxembourg is a philosophical romance in which Voltairean skepticism is warmed over with the sensuality left in a symbolist poet's cookshop. In our opinion the book deserves short shrift on literary grounds, even

†A Night in the Luxembourg. By Rémy de Gourmont. Boston: John W. Luce & Co. $1.

leaving morality out of the case; and it only annoys us the more for the translator to urge: "M. de Gourmont is perhaps more likely to be attacked for blasphemy [than for prurience], but only by those who do not observe his piety toward the thing that he most reverences, the purity and clarity of thought. He worships in a temple not easy to approach, a temple where the worshippers are few, and the worship difficult." It would be a comfort to hear what Dr. Johnson would say about this "critical" drivel: Dr. Johnson not being our ideal of a profound philosopher, yet an excellent exponent of sound morality and British common sense. Mr. Ransome, also, is an Englishman——

In so far as the present volume expresses a philosophy, it is the philosophy of change and of chance. The book includes a few passages that merit quotation—tho they rarely call for acceptance as doctrine. The wholly human superintelligence which plays at divinity here says of God, his alleged Father:

> He is not dead, but he is old. The gods end by growing old. He has retired into the eternal silence of disabused intellects. He still gives advice, he alone is capable of explaining certain human evolutions, but the indifference of age has dried up his heart.

Pilate asked, What is Truth? And the godhead of M. de Gourmont makes this reply to the eternal question:

> Humanity has never lived but in error, and, besides, there is no truth, since the world is perpetually changing. You have acquired the notion of evolution, which, within certain limits, is correct, but you have wished at the same time to preserve the notion of truth; that is contradictory. If you were to succeed in constructing, in your intellect, a true image of the world, it would be already untrue for your grandchildren.

The termites, we are reminded, were at one geological stage the earth's most highly developed creatures. The lowering of the temperature checked their evolution—and man's chance came. Man raised himself above his fellow animals in discovering the art of fire:

> Fire, in giving you a constant summer, also gave you leisure. Thence your civilizations, proud daughters of idleness, who deny their mother. It is from idleness that everything has been born among men. Leisure is indeed the greater and the most beautiful of man's conquests. But . . . after conquering leisure, you disdained it, and slaves, ashamed of the inactivity of their domesticated hands, set themselves to preach among you the sanctity of labor.

The key to Rémy de Gourmont is, perhaps, found in his make-believe deity's observation: "Ah, well, you shall know that I could have told you the exact opposite, and that also would have been the truth." M. de Gourmont is probably too sage a person to take himself seriously —as does his Boswellian translator. In justice to Mr. Ransome let it be added that he is more efficient as a translator than as a critic.

France's Second Empire

For some years past the French public has been eagerly reading the long procession of volumes in which M. Ollivier, Napoleon the Third's liberal minister, has related the dramatic downfall of the Second Empire. His narrative is always vivid, eloquent, personal, and it is like a cake well compounded with just the right number of plums in the shape of new documents and revelations of diplomatic secrets. It culminates with the account of Ollivier's ministry and its downfall under the disasters of the war with Prussia in 1870.

Mr. Ives has performed a useful service in putting together, mostly from volumes XIII and XIV, and with the assistance of the author, a considerable number of passages from the *Empire Libéral* that makes a well connected book in English form, justifying its title, *The Franco-Prussian War and Its Hidden Causes.*[1] We advise him, however, if he reaches a second edition, to correct the frequent French forms he uses for German names. The American public has undoubtedly long been under the impress of the German view of that great event, and has failed to realize that there was a French side to be considered. Ollivier is a special pleader, of great forensic skill, who accumulates data before the court that amply prove the accepted German version to need revision, but who also occasionally obscures the fact that alongside of the routine of French policy and diplomacy there were much greater

[1] *The Franco-Prussian War and Its Secret Causes.* By Emile Ollivier. Translated from the French with an introduction and notes by George Burnham Ives. Boston: Little Brown & Co. $5.

questions before Europe. He may be justified in believing that his government was pacific, unfortunate and a little unfairly dealt with, but the greater fact still stands that the fall of Napoleon III was largely due to his selfish obstruction of the course of German nationalism. We strongly recommend the book to those interested in modern history.

A very different note is struck in *Memories* of Lillie de Hegermann-Lindencrone, formerly Lillie Greenough of Cambridge.[2] Here we have the Second Empire in the way of amusing glimpses of court life and of famous persons; and all very brightly. A good sample of their quality is the following set of replies by Napoleon III to the author's indiscreet album questions:

Which is your favorite quality? Gratitude.

Your favorite author? Tacitus.

Your favorite occupation? Trying to solve unsolvable problems.

Whom would you like to be? My little boy.

Whom do you most detest in history? The Constable of Bourbon.

For what faults have you most indulgence? Those from which I profit most.

In Dr. Barthez's *Empress Eugénie and Her Circle*[3] we have a volume comparable with this last rather than with Ollivier's. The book really consists of letters written by the physician of the Prince Imperial to his—the physician's—wife. The details offered here are frequently minute to a degree. Page after page is devoted to discussion of the Illustrious Infant's health, and to other matters equally unimportant. Yet many readers will doubtless be entertained by the particulars which Dr. Barthez offers of life at Biarritz and at Paris. He admires the Empress and regrets the Emperor's infidelity to her. His point of view is always that of the bourgeois in the midst of great folk, trying to maintain a due balance between worldliness and indiscretion. Perhaps he exaggerates his love of virtue, however; remember that he is writing these letters to his wife in the provinces, and from the most frivolous of imperial courts. Here is one of his accounts of Eugénie:

I have seen her in every kind of costume: in her simple, ugly bathing-dress; in her dressing-room when her maid was undoing and brushing her long, lovely hair—it is a deep blond, with golden lights here and there; I have seen her in morning and evening dress, in city clothes, in ball dresses—and everywhere and always I have admired her. But certainly her town frocks and hats suit her less perfectly than anything else.

The New International Yearbook

The New International Yearbook, edited by Frank Moore Colby and Allen Leon Churchill and published by Dodd, Mead & Co., may be regarded as an annual supplement to the *New International Encyclopedia,* or as an independent volume giving a comprehensive survey of the world today and of recent progress in art, literature, science and industry. The new volume maintains the former high standard of the work for scholarship and accuracy. It includes the complete record and statistics of the year 1912, both American and foreign, which the yearbooks and newspaper almanacs printed in December or January are not able to do. The leading article on the "Presidential Campaign" occupies nearly fifty pages and gives the party platforms in full as well as extracts from the speeches and the incidents of the campaign. In the foreign field, Turkey, China, Persia and Mexico are treated at length with maps in color.

A Boy in Greece

George Demetrios is a Bostonian—but he was born a Greek. He has told his boyhood experiences to John A. Huybers, an artist, who has improved the opportunity afforded in preparing the material for publication by including a large amount of historical information. The boy, altho a Greek, lived in Macedonia; what he tells of life in that country is of special interest just now. The boy's childhood in his mountain village, his schooling in a larger town, the games that all Greek boys play, his schoolroom tasks—these fill the early chapters. George Demetrios has a bright and active mind. From the experiences of his relatives and friends, a running commentary is given on the race conflicts in Macedonia, the sympathy between the Balkan States, and the universal hatred of the oppressor. An uncle of the boy lived in Constantinople and thru this relative the family in Macedonia were informed of the rise of the new party called the "Young Turks." Anecdotes of a personal flavor tell the story of the arrival of the Greek troops.

Not the least interesting part of the book

[2] *In the Courts of Memory,* 1858-1875. From contemporary letters. By L. de Hegermann-Lindencrone. Illustrated with portraits, facsimiles, etc. New York: Harper & Bros. $2.

[3] *The Empress Eugénie and Her Circle.* By E. Barthez. Translated by Bernard Miall. With 31 illustrations. New York: Brentano's. $3.

is a letter, added as a postscript, which was written to the Greek boy by his sister after his arrival in America. The envelope itself was a bearer of good tidings; it bore for the first time a Greek stamp. Reflected in the letter is the enthusiasm of the loyal villagers over the entry of the Greek troops. *When I Was a Boy in Greece* is a book not lacking in appeal to young or old, and interesting for its timeliness. (Boston: Lothrop, Lee & Shepard Co., 60 cents.)

The Happy Warrior

It takes no small skill in letters to blend Victorian and modern fiction into one satisfactory mixture, yet that is what A. S. M. Hutchison, the author of this English novel of pathos and humor, has done with the utmost success. *The Happy Warrior* is another story of the open road and its haphazard adventures, of gypsies and of prize fighting—there is a memorable set-to with bare knuckles in the bout with Foxy Pinsent—of an unrecognized heir to a noble house and his struggles with the problems of life and honor. There are characters and scenes one might assign to Dickens—the horsebreeder, Hunt, even Dora herself at times—yet the note of the book is essentially modern.

The characters, on the whole, are of that order known as "loveable," and the dearest of all the happy warrior himself, who achieves his noblest victory in the sacrifice of love and life for his boyhood chum, the usurping heir. His death, tho necessary for the novelist's purpose, will wring many tender hearts to whom the heroes of fiction are flesh and blood friends. This is a work of real worth and charm, couched in inviting English in spite of mannerisms. To read it, retire into seclusion, be yourself, and laugh and weep to the heart's content. (Little, Brown & Co., $1.35.)

Socialism

The subject of Socialism has two excellent contributions in Morris Hillquit's *Socialism Summed Up* (H. K. Fly Company, $1) and in Allan L. Benson's *The Truth About Socialism* (B. W. Huebsch, $1 and 25 cents). Mr. Hillquit treats of the causes that make for Socialism and the aims, methods and acomplishments of the movement. A final chapter gives an account of the growth of the Socialist party in the United States. Mr. Hillquit is one of the leaders of the international movement, and he speaks with ample knowledge of his subject. It is a brief book, but sententious and weighty. It is an explanation by one busy man for another of what the Socialists are doing and trying to do.

Mr. Benson's treatment of the subject is at once expository ond argumentative. The tone is colloquial and the style simple, clear and forceful. In a direct heart-to-heart talk he explains all the main points about Socialism, and then asks his auditors what they have to say for themselves. There are few writers, if any, whose wares come before the public, so gifted with the ability to explain things with clearness and vividity as is Mr. Benson.

Why I Am Opposed to Socialism, compiled by Edward Silvin (published by the author, Sacramento, Cal.; 75 cents and 50 cents), is a collection of some seventy brief statements by persons more or less known to the public, giving their reasons for opposing socialism. Among the better known contributors are Prof. J. B. Clark, Louis F. Post, Ex-Gov. L. F. C. Garvin, Prof. G. L. Raymond and Prof. George Trumbull Ladd. It is an interesting collection, which will well repay reading both by pros and by antis. A companion book, *Why I Am in Favor of Socialism,* is also announced by the author, at the same price.

The Bend in the Road

It is good that city men yearn for the land, and sometimes don overalls and attack farming with an earnest purpose—aided by willing and well-paid "hired men." Truman A. DeWeese has written a book about this impulse to return to the land. and inhabit a country place that lends itself to the cajolery of modern methods and ready money. *The Bend in the Road* (Harpers, $1) is a pleasant succession of naïve chapters, a half-sophisticated *journal intime,* recording the several phases of the writer's bucolic adjustment. The reader tastes something of the John Burroughs flavor, breathes the atmosphere of "Ik Marvel," and now and then gets a whiff of Thoreau, inarticulate as these resemblances mostly are. Mr. DeWeese is an advertising man, with a record of success, and was formerly a newspaperman. We note the flat perspective of newspaper style, and the sharpened note of the advertiser; yet we somehow feel the genuineness of the point of view and the man, and the enjoyment of a porch twilight chat with a neighbor worth while.

Hindu Philosophy

It is some thirty years since Prof. Paul Deussen's *System of the Vedanta* (Open Court, $3) appeared in the original German. During this period it has easily maintained its place as the clearest and fullest exposition of this phase of Indian thought. The authorized translation by Charles Johnston

now makes this great classic accessible to the English reader.

Professor Deussen's work covers the philosophical side of the Vedic system and is based on the Vedanta of Bâdarâyana and the noted commentaries of Sankara. The author is not only a recognized authority in Vedic literature, but a student of philosophy as well, and his expositions are given in Western terms and clarified by the comparisons he makes with developments in European philosophic systems. Some of Professor Deussen's peculiar views, e. g., that which looks for the root meaning of *Brahman* in prayer, have not been generally accepted by other scholars, but on the whole his work may be regarded as an authoritative and profound presentation of the Vedic philosophical system.

The Loeb Classics

Of that series of exquisite 16mo volumes, the Loeb Classical Library, we receive five new issues, one from the Latin division, *Cicero, Letters to Atticus,* and four from the Greek, volume one of *Sophocles,* the *Argonautica,* of Apollonius Rhodius, *Appian's Roman History,* and *The Greek Bucolic Poets,* including Theocritus, Bion and Moschus, and the anonymous remainder. We do not need to tell our classical readers the value of the Greek and Roman literature, but we do need to call attention as often as may be to the advantage of having, in the most convenient form possible and on thin paper, the Latin or Greek on one page and the translation on the page opposite, and the two occupying no more room than either does alone in most editions. It is a delight to read the English, but an added pleasure to be able to turn the eye to the original with no bother of dictionary. It will be a pity if any library misses one of the volumes, even if they should run to hundreds, for it is intended that this series should include the entire body of classical literature. (Macmillan Co., each $1.50.)

Literary Notes

A monument to four of the South's poets, Sidney Lanier, Father Ryan, James R. Randall and Paul Hayne, was unveiled toward the end of last month at Augusta, Georgia.

The main principles of the teaching of Laotzse are given a rambling theosophical interpretation in the fifteen lectures on *The Inner Life and the Tao-Teh-King* (Theosophical Publishing Co., $2), by C. H. A. Bjerregaard, of the New York Public Library. The author emphasizes simplicity as the central feature of the mystic life, and puts Rousseau beside the famous Chinese teacher as guiding geniuses to better things: "In my opinion the new ideas for our age, ideas we all long for in the name of religion, philosophy and social organization, lie slumbering in the teachings and methods left us by Laotzse and Jean-Jacques."

John S. Sargent is painting a portrait of Henry James, who is his friend as well as a fellow expatriate. The portrait will be presented by English friends in commemoration of the novelist's seventieth birthday.

Messrs. E. P. Dutton, the publishers, have removed from Twenty-third street, New York City, to 681 Fifth avenue, near Fifty-fourth street. Northward the booktide rises; and in only a few weeks the Messrs. Scribners will desert lower Fifth avenue for a new building near St. Patrick's Cathedral.

Mr. Leonard Stuart in a moralizing vein declares that "religion has been opprest by the pagan phantasmagoria for centuries," but now *The Great God Pan* (New York: The Tudor Society, $1), who is made to typify the worship of nature and its sacrificial systems, is dead, and the long-expected gospel of Humanity has arisen to claim the world's attention.

The Duc de Montpensier, who, before being invited, has declined the throne of Albania, "prizing his French citizenship too highly to sacrifice it for any foreign crown," has written an account of French Indo-China, published by Perrin with an introduction by M. le Myre de Vilers under the title *Notre France d'Extrême Orient* (Paris; 5 francs). Tho the ducal author is a sportsman, he pays less attention to that side of the country than to economic conditions and possibilities. But that he is not wholly commercial in his point of view is strikingly illustrated by the fact that his chapter on touring is given up to a discussion of native art and letters.

The founder and first editor of the *Poetry Review* of London, Mr. Harold Monro, announces the issue of a quarterly periodical, *Poetry and Drama,* which he describes as "the representative organ of the younger movement in English literature." The first number contains, among other things, articles on the Greek Genius, Shakespeare and Granville Barker, and Ella Wheeler Wilcox; also reviews of books and plays by Henry Newbolt, Richard Buxton and Gilbert Cannan, and verse by Maurice Hewlett, Lascelles Abercrombie, J. E. Flecker and Michael Mecredy. The new quarterly is published at 35 Devonshire street, Theobolds road, London, W. C., at 10/6 a year.

Fifty Years Ago

From **The Independent**, May 14, 1863

AN AFFECTING INCIDENT IN PLYMOUTH CHURCH

—On Sunday morning an incident occurred in Plymouth Church, Brooklyn, which suddenly drew tears from the eyes of nearly all the great congregation. The ceremony of baptism of children had been appointed for that morning. . . . Mr. Beecher carried up to the pulpit a little girl about five years of age, of sweet face, large eyes, light hair, and fair as a lily. Pausing a moment to conquer his emotion, he sent a shiver of horror through the congregation by saying, "This child was born a slave, and is just redeemed from slavery." It is impossible to describe the effect of this announcement. The fact seemed so incredible and so atrocious, that, at first, the spectators held their breath in their amazement, and were then melted to tears. We give the story in Mr. Beecher's words, which were spoken in a tremulous, broken voice: . . .

"Look upon this child—tell me if you ever saw a fairer, sweeter face? This is a sample of the slavery which clutches for itself everything fair and attractive. The loveliness of this face, the beauty of this figure, would only make her so much more valuable for lust. While your children are brought up to fear and serve the Lord, this little one, just as beautiful, would be made, through slavery, a child of damnation. The whole force of my manhood revolts and rises up in enmity against an institution that cruelly exposes such children to be sold like cattle. Look upon this child, every one of you!—look upon her, every young man and maiden in this house!—and, by the memory of this scene, and for the sake of such little ones as these, and for the sake of Christ, let your souls burn with fiery indignation against the horrible system which turns into chattels such fair children of God! May God strike for our armies and the right, that this accursed thing may be utterly destroyed!"

SURVEY of the WORLD

The Pops

"A look of mirth from underneath the brow,
A stein of beer, a plate of pretzels, thou
Beside me, list'ning to *Die Fledermaus*,
Ah! summer's Pops are Symphony enow."

Thus saith the bard of the *Boston Transcript* last Tuesday afternoon in commemoration of the opening of the twenty-eighth season of Boston's famous popular spring concerts.

The "Pops" are given at the end of Boston's severely classical musical season, and just at the time the young man's fancy is turning. They continue every evening except Sundays for more than eight weeks, thru the early part of July.

At the "Pop" concerts an orchestra of sixty-six pieces, containing about two-thirds of Boston's regular Symphony Orchestra—than which there is no better in the United States—plays each evening a program of twelve numbers, mostly of the better grade of light music. Popular overtures, songs and medleys from the operas, especially the light operas; snatches from the better known symphonies; Vienna waltzes, Sousa and Herbert marches, and even Wagner arias; in fact all sorts of things for the vast army of those who go about saying, "I don't know much about music, but I know what I like."

These good people and many others turn out in large numbers to the "Pops." The regular seats in Symphony Hall have been taken out and chairs and tables placed inside.

The audience may smoke and eat and drink at will. The lower balcony is reserved for those who are averse to smoking and they have their own restaurant nearby. The leader of the orchestra this season is Mr. Urack, who took Dr. Muck's place last midwinter during the latter's illness.

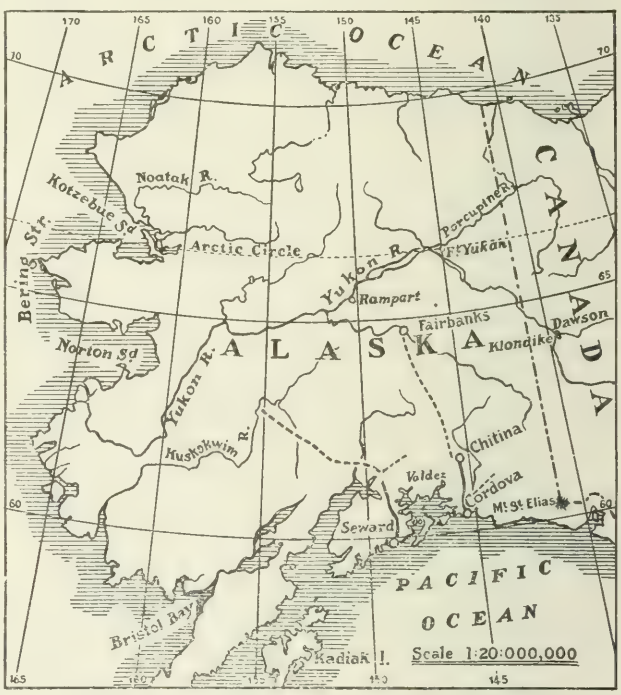
If Mr. Urack has shortcomings as a conductor of symphonies, the *Transcript* bard informs us he becomes a "glorified prodigy" when the lighter stuff of the "Pops" is in hand. "On the opening night he carried 'Madame Butterfly' with a sensuous sweep and a rich and beautiful curve that the Opera House seldom gives it. He whirled thru 'The Mikado' and lent it a hundred new touches of color, beauty and whimsy. And he swung into 'The Blue Danube' with a swirl of rhythm and a volley of tune that seemed to sweep the orchestra off its gray platform and round and round the hall with the fury of the dance."

Excellent is Mr. Urack. Thrilling is the orchestra. Ubiquitous are the waiters in cubist scarves and Bulgar blouses. Alluring are the "soda-water kissed tables." Clean and decent and informal and happy are the "Pops." How long before all our progressive cities will have their equivalent?

To Develop Alaska's Resources

What are the best routes for railways by which Alaska's enormous deposits of coal can be reached and great tracts of agricultural and grazing land in the territory be made attractive to settlers? For this question an answer was sought by the Alaska Railroad Commission, appointed in August of last year by President Taft, and composed of the following persons: Major Jay J. Morrow, of the Army's engineer corps; Alfred H. Brooks, of the Geological Survey; Leonard M. Cox, civil engineer, of the Navy; Colin M. Ingersoll, consulting railroad engineer. They started northward from Seattle on September 3, examined Alaska's ports and existing railways, laid out new routes, returned to Seattle on November 17, sought additional information at Ottawa and elsewhere in Canada, and then submitted an elaborate report of 172 pages, which has been sent to Congress.

Alaska's coal deposits, mainly in the Bering and Matanuska fields, lie not far from the southern coast. The two great inland waterways, the Yukon and the Kuskokwim Rivers, flow westward to Bering Sea. The navigable waters of these streams are 5000 miles, and in the river basins are extensive tracts of agricultural land. The climate there is favorable to permanent settlement and industrial development, but the rivers can be used for transportation in only three months of the year, and even then the route from the Pacific Coast States is so long and circuitous that freight charges are very high. Only by railroads from ports on the southern coast can these river basins be opened to the homesteader, or the coal deposits be utilized. By such roads also mineral wealth of various kinds may be brought to light.



Alaska's mineral output already amounts to $229,000,000, but untold riches remain to be developed because exploration and production have been retarded by lack of transportation facilities.

At the beginning, the commission says, two independent railway systems should be constructed from the southern coast northward, one extending to the valleys of the Yukon and its tributary, the Tanana, and the other reaching the basins of the Kuskokwim and Susitna. The best route for the first begins at the port of Cordova. Alaska already has 466 miles of railroad, and one of the lines extends from Cordova to Chitina. To this the commission would add 313 miles, prolonging the road to Fairbanks, and would build a branch to the Bering coal field. If a satisfactory traffic agreement with the existing Copper River and Northwestern road cannot be made, the new line should be brought down to the coast at Valdez. For the second system the best available route is from Seward around Cook Inlet to the Iditarod. Here again is an existing road. The commission would prolong it by building from Kern Creek (the present inland terminal of the Alaska Northern) to the Susitna River, 115 miles, with a branch to the Matanuska coal field, and another extension of 229 miles to the Kuskokwim River.

The commission's recommendations involve the construction of 733 miles of road, at an estimated cost of $35,000,000. Ought the Government to build and operate the roads? The commission was not required to answer this question, but it submits estimates of cost of operation following Government construction and ownership, as compared with cost if private capital is used. In his message to Congress (February 6) Mr. Taft said the inference to be drawn from the report was that in the judgment of the commission its recommendations could certainly be carried out only if the Government should build, or should guarantee the cost of, the roads in question. He thought that the Government should own the roads, if it guaranteed the principal and interest of the construction bonds. But he opposed operation by the Government, holding that Government ownership, with private operation under lease, was the proper solution of the problem.

If the road to Fairbanks should be built with private capital, the commission shows, upon the assumption that this capital must earn 6 per cent, that the passenger rate must be at least 7 cents a mile, and the freight rate 8 cents per ton-mile. These rates would be high enough to defeat the immediate object of the railroad, namely, the expeditious development of the interior of Alaska. The rates should not exceed 5 cents for freight and 6 cents for passengers. On the other hand, a fixt charge of 3 per cent on the investment is assumed, if the Government builds the road. This charge would permit a passenger rate of 6 cents, and a freight rate of 5½ cents. Similar comparisons are made for the other roads recommended.

Altho Alaska's coal resources are so great, it is shown that thus far only 40,000

PROJECTED RAILROADS IN ALASKA

The solid lines show existing railways; the broken lines the routes recommended by the President's commission. Both new roads will tap coal fields at present undeveloped.

tons of her coal have been produced and marketed. But 1,500,000 tons have been imported, at high prices. Failure to utilize the coal deposits has stimulated the substitution of California oil in the Pacific States, and even in Alaska oil is supplanting coal because of the high cost of the imported mineral. The commission says there is a market in the territory for at least 150,000 tons a year, and probably a market in the Pacific States for 1,500,000, altho there is some doubt as to the quality of the Alaska product. This coal, however, would surely displace the 200,000 tons now used on the Pacific Coast for coking. The navy in Pacific waters needs 300,000 tons a year, and is now supplied by coal brought around Cape Horn at a cost, in San Francisco, of from $7 to $9 a ton. If coal of suitable quality were mined in Alaska, it could be sold at San Francisco for about $6.

Railroad construction in the territory

was halted, and now has virtually been discontinued, by the controversy about coal lands. For this reason the territory's development has been checked. Construction of the proposed railroads, the commission says, should be undertaken at once and prosecuted with vigor.

Grapes and Sawdust

Your choice California grapes are now coming to the dealer packed in redwood sawdust. Another waste product has thus been turned into a wealth producer.

The sawdust, which accumulates in such large quantities about lumber camps as to be a positive detriment, is now found to be worth money to the fruit men, being considered as efficient in protecting grapes as the powdered cork in which Spanish grapes are packed. The luscious bunches are placed between layers of the sawdust, which settles about each berry, keeping them from rubbing against each other and acting as a cushion to preserve them from jarring.

This is the second season in which the new packing has been used to any extent in California, and the test has now passed the experimental stage and is declared to be a commercial success.

From the county of San Joaquin alone there are shipped more than 2500 carloads of table grapes every year; in the past the loss from decay has been so great as to cut largely into the profits. By the new method this loss is minimized and "top-notch" prices are obtained because of the perfect condition of the bunches.

Recent New York market returns mention a price of $2022 for a carload of Emperors. Fourteen carloads of redwood packed grapes brought $24,453.67 this past season, and a large part of this handsome sum must be credited to the despised redwood sawdust.

The Last Boundary Monument

Alaska, "the great country," as the Indians named it, is still comparatively unknown, but the boundary line between it and the Dominion of Canada has at last been determined and appropriately marked, thus ending a long dispute which at one time threatened the friendly relations between the Dominion and the United States. The part of the boundary line upon which the two countries failed to agree was that extending southward from Mount St. Elias for about 650 miles, but the dispute was finally settled by reference to the Alaska Boundary Tribunal. American and Canadian surveyors afterward accurately surveyed the boundary agreed upon by the Tribunal and marked it by monuments. The latter are of bronze and, according to instructions, placed at a distance of not more than four miles apart and intervisible.

Naturally, the surveying of this southern boundary, together with the growing importance of Alaska and the Canadian Northwest, made it desirable that the 141st meridian, or rather that part of it which forms the international boundary, should also be accurately determined. In making this survey, which has extended over several years, the starting place at the south was at a point where the boundary meridian intersects a ridge running westerly from Mount St. Elias. The determination of this part of the international boundary line was a work of much difficulty owing to the fact that it runs thru a wild and in some parts the most desolate and inaccessible region of the continent.

It was in 1906 that a treaty providing for the survey and demarcation of the 141st meridian was signed. The work has been progressing ever since as rapidly as conditions allowed. Usually it has taken the entire season when such work was possible (about three and a half months each year) to survey from fifty to seventy miles of the boundary line. Where the bush was not thick one party made a record of 100 miles in sixty days.

There was no formal ceremony connected with the planting of the last boundary monument near the bleak and lonely shores of the Arctic. This last pillar occupies a site only twenty-one feet above the ocean, which is here dotted with floating ice even in midsummer. It will be seen by few except hunters and trappers and occasionally, perhaps, by the crew of a whaler in these desolate northern seas.

Tricity House

The proverbial slowness of the average English city is fast fading away; ten English towns have already caused a reduction in the cost of electricity, for cooking purposes only, by fixing a rate at one cent a kilowatt-hour.

Naturally enough, with this great reduction in price there has been a corresponding increase in the use of the current in the kitchen. At Torquay an all-electric restaurant has been working on a practical basis for nearly a year; at 48, Oxford street, London, "Tricity House" has been in operation for six months. All the cooking at this London restaurant is carried on by electricity, and the variety of dishes is greater than anywhere else. Four hundred and twenty meals are supplied daily, with a steady increase every week. The prices are

about the same as in the other restaurants, the cooking tasteful and hygienic.

The kitchen is comfortably small and placed at the top of the building. It is only twelve by fifteen feet in size, and is free from the dirt, dust, dinginess and darkness of most kitchens close to the street. Not only is it bright, but it is cooler and therefore pleasanter than most kitchens. Unlike the "cook with gas" kitchens, the air is pure and fresh. There is plenty of space, for the paraphernalia and utensils necessary for gas and coal cookers are not needed.

Four 1000-watt extension plates with four rings above them are part of the equipment for grilling. The top plates can be changed in size and tilted at various angles. This allows just the right amount of cooking to suit the taste of any diner. There is also a hot cupboard for plate warming fitted with two extension units of 200 watts each. Fats are fried with a 1500 watt utensil. Fourteen other extension plates of 900 watts each can be used with any ordinary kitchen vessel made with a flat bottom.

Two double metal ovens are employed for roasting meats. Hot water for washing is supplied by an eight-gallon urn, with five 1200 watt electrodes each with a distinct control. All the electric devices in the kitchen are interchangeable.

In addition to the electric equipment, there is on every floor of Tricity House a little pantry or service counter where electric cookers of an auxiliary type are found for making tea, coffee, chocolate, toast, and other minor dishes, practically before the eyes of the diner.

The freedom from odors is no small feature of the electric restaurant. That of itself would make the example of our British cousins worth following, for the cost of fixtures is not great. The real obstacle to the general adoption of electricity for cooking in this country is the excessive rate per kilowatt-hour for current. If the service companies can be made to realize that there is money in it, as the English companies have undoubtedly discovered, they may be expected to arrange a special cooking schedule even tho a higher price is maintained for purposes of power and light.

In the writer's family of six, during the years 1904 to 1908, coal was used for cooking. The average cost of the extra girl and the fuel was $16 a month. From 1908 to 1913, gas was used for cooking. At once there was a reduction to an average expense of $9 a month. We have been using electricity for only three months and the average is about the same as that of gas. But the cleanliness, lack of odor, convenience, and ease make cooking with electricity actually cheaper.

What Flowers Can Be Blue

The Burbanks have their limitations, popular wonder to the contrary notwithstanding. Mendelian gardening cannot produce flowers of any unnatural tint that suits the fancy of the experimenters.

Only such changes of color in blossoms are possible as the chemical constitution of the plant experimented with will permit. A gardener may think it would be good business to produce a true-blue rose or sweet pea, but he would waste his time to try it. The blue-furnishing sort of aromatic hydrocarbon in the series of organic bodies to which flower colors are due does not exist in the rose family, nor in that of leguminous plants. It does qualify the chromogen in veronicas, salvias, pentstemon, etc., and in all the groups allied to the gentians and composites.

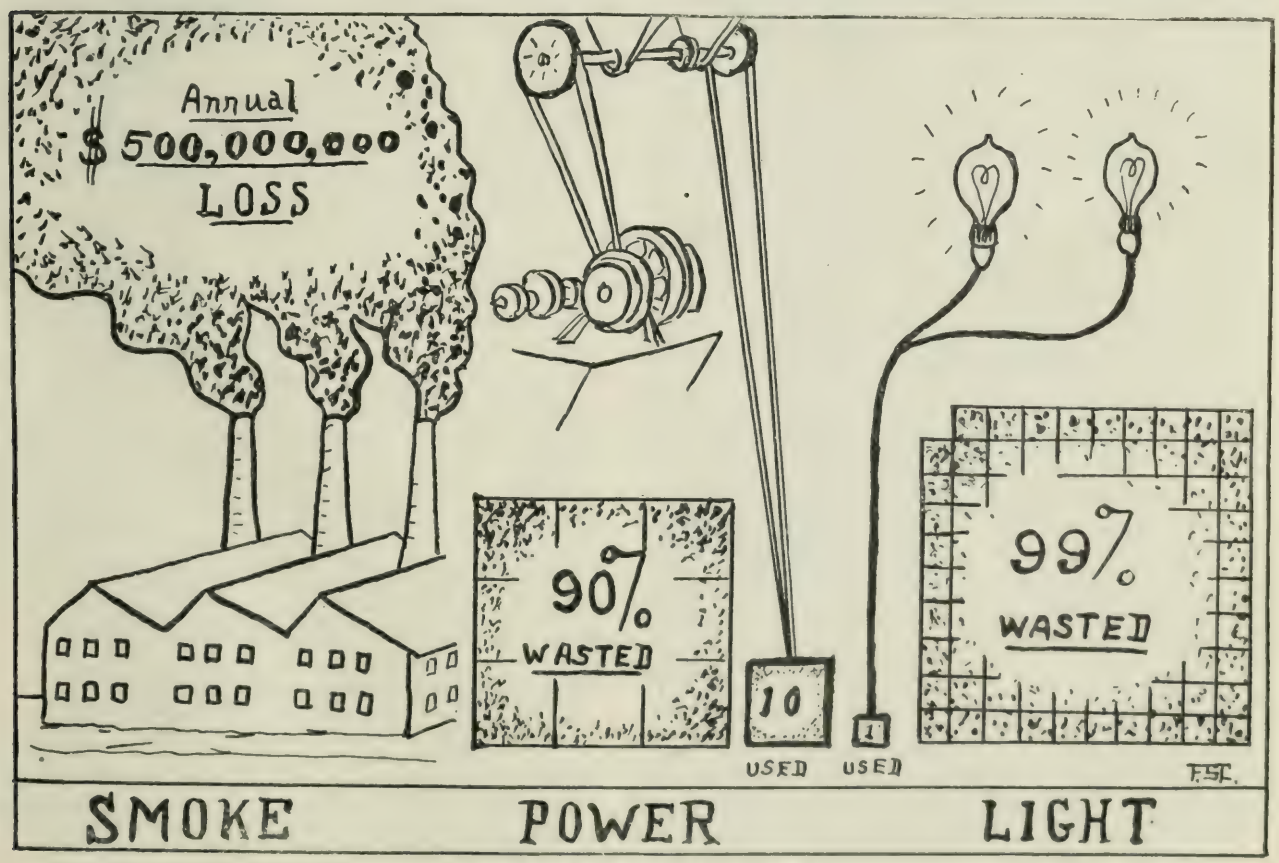
That particular chromogen (six HO groups) which is the parent of blue in blossoms is identical with the tannin which distinguishes coffee (whereas the characteristic element of tea is a tannin that is the parent of red, as in camellias). We can produce a persistent and beautiful azure compound artificially from caffetannin, but from no other (save one) of the whole series; and the bright color of all the truly blue flowers is due to the presence in the plant of this substance, coupled with the fact that this form of hydrocarbon will oxygenize more completely than any other of its series.

Another curious fact is, that the more ovules a plant of this color group produces the more intense and rich its hue; some, as the yarrow, where caffetannin may be plentiful in stem and leaves, but the plant's reproductive powers are low, exhibit mostly white flowers. This matter may seem technical, but carries the practical lesson that horticulturists will waste their labor in trying to evolve a blue-blossomed variety from any plant which does not contain the chromogen of blue. Hence, before the gardener begins experimenting he should consult a chemist. No caffetannin, no blue flowers.

How We Waste Our Coal

In 1907 twenty times as much coal per capita was used in the United States as in 1850. The amount of coal mined in the first decade of the twentieth century exceeds the amount mined in all previous decades. Naturally we ask: How long will coal be available for the use of succeeding generations?

Mr. Gannett estimated on the basis of the amount of coal taken out in the year 1908, that, if the rate continued, the available and accessible coal will be exhausted in 2027; that is, in 114 years; and that the



total coal supply will be exhausted about the year 2050, less than 140 years hence! If we feel any responsibility for future generations it is clear that we must cut down our consumption of coal and reduce its use to our absolute needs. This means that we must reduce the waste of coal; we must substitute as far as possible other materials for coal, and we must see to it that our coal when once mined is used efficiently.

It has been estimated by mining experts and geologists that for every ton of anthracite taken out of the mines, from one to one and one-half tons have been wasted in the process of mining. For every ton of bituminous coal taken out of the mines at least one-half a ton has been wasted. This means that the waste in mining in the past has run from 100 to 150 per cent for anthracite coal. This waste is partially due to the custom of working the lower beds before the upper. The excavation made by taking the coal out of the lower beds first causes a sinking of the ground above, and the upper beds are mashed to such a degree that the coal cannot be extracted. The upper beds should be worked first.

In mining there is always produced some very fine material called slack or culm. This is not always marketable. Many thousands of tons of this material have been thrown on the ground and burned to free the mine from obstruction. This is useless waste, for the slack could be made into briquettes with coal tar and thus put in a form in which it can be utilized.

After the coal is taken from the mine we waste enormous values every year thru careless consumption. In manufacturing districts clouds of thick black smoke belch forth from innumerable chimneys. Smoke is unconsumed coal. When the smoke is dense it represents a loss of from a fifth to a third. Mr. H. M. Wilson estimates that 8 per cent of the coal used in the production of light, power and heat goes up in smoke annually. When we take account of the injury to the health of people in a smoky city, of the injury to buildings and parks, this same authority considers that the total annual loss is $500,000,000.

When we use coal to fire the boiler of a steam engine we are transforming energy; we expect to get a certain amount of power out of the transformation. Of course there is always more or less loss in any transformation of this kind, but few people realize the tremendous loss in this particular case. President Van Hise estimates that under the most favorable conditions with the best firing, we do not get in power more than 15 per cent of the heat units of the coal. The average steam engine does not develop into power more than 10 per cent of the heat energy. This means that 90 per cent of the heat energy of the coal is wasted! We need more efficiency in our

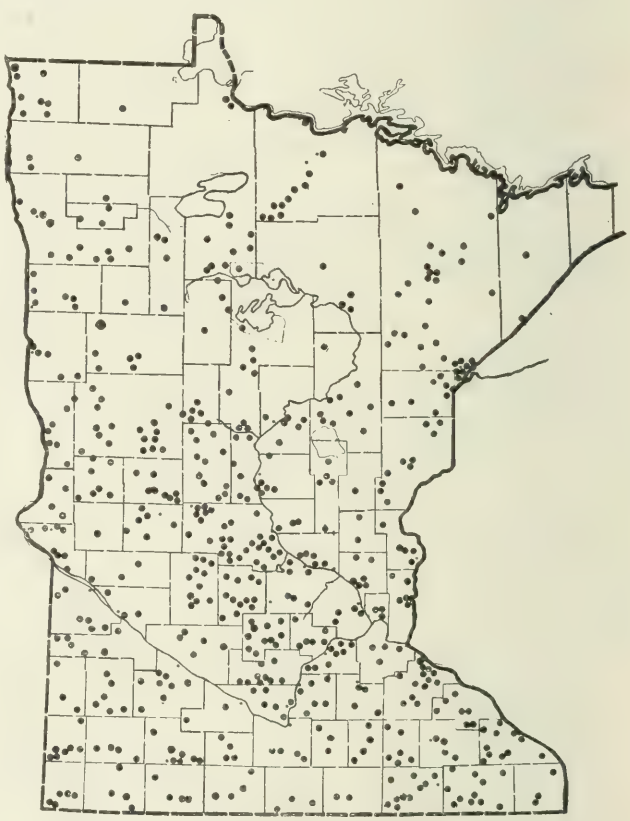
WHERE OUR COAL GOES

steam engines. Gas engines are more economical.

If the loss of coal is great in developing steam power, it is even greater in making light. To transform the heat energy of coal into light, we must consume the coal to make steam, transform the power of steam into electrical energy, and then transform that into light. In this process not one per cent of the energy of the coal is transformed into electric light. This means a waste of over 99 per cent of the energy of coal. The waste in the case of gas light is not so great. But electricity for obvious reasons is displacing gas as a light. Wherever water power can be used to convert electrical energy into light this should be done.

F. STUART CHAPIN

Instructor in Economics and Sociology, Smith College.



Extending University Extension

The University of Minnesota is the university of all Minnesota. Like her neighbor, Wisconsin, the state believes both in sending people to college and in sending the college to the people. The map gives some idea of the way the whole lump is being leavened by the influences originating in Minneapolis. Every dot indicates a place where the university did extension work of some sort during the year 1911-12, and at that the map takes no account of fifty-two scattering academic lectures and entertainments, nor of the seventy-seven communities reached by correspondence courses in agriculture, economics and education.

Five different kinds of extension work were carried on at these centers. The farmers, naturally enough in the nation's wheat field, got the largest share of faculty cooperation. The university supervises twenty-one demonstration farms, sending three men to visit each at least twice a month. Then forty-six one-week courses in agriculture and home economics were given for the public generally, forty-four short courses to teachers at the county training schools. County fairs must not be slighted; demonstration tents with educational exhibits were sent to fifteen. Farmers' institutes, contests for school children in sewing, baking, manual training, agricultural and even in tomato growing and canning, over a thousand miscellaneous meetings with country folk, two educational trains—here's richness for any state. One wonders what has become of the traditional "isolation" of farm life.

Special extension lectures at fifteen centers, organized classes at several more, and municipal service in three cities interested a wider public than the agriculturists. But no place of the whole movement is more interesting than the University Weeks, for here co-operation—between faculty and undergraduates, university and local agencies—is most abundant.

The university "teams" visited eighteen towns; six will be added to the circuit this year. Women's clubs, the state library and health and labor authorities, and other agencies help; the glee club, dramatic clubs, and debating squad work with the faculty missionaries. Last year the six days given to each town were portioned off, one to the farmers, one to the business men, one to "art and literature," others to "town and county," "public health," and "home welfare." A trained nurse lectures thruout the week, while the faculty speakers hold informal conferences in the morning and make addresses in the afternoon. The undergraduates give two plays and a concert; the debating teams have a repertory of two or three popular questions from which their audiences may choose. Illustrated lectures round out the week—and a full week it is. Not only do the people of each town on the itinerary receive substantial help in their local problems; they also catch a glimpse of the play as well as the work of their university.

University of Minnesota Alumni Weekly.

THE CAMPUS, UNIVERSITY OF MINNESOTA

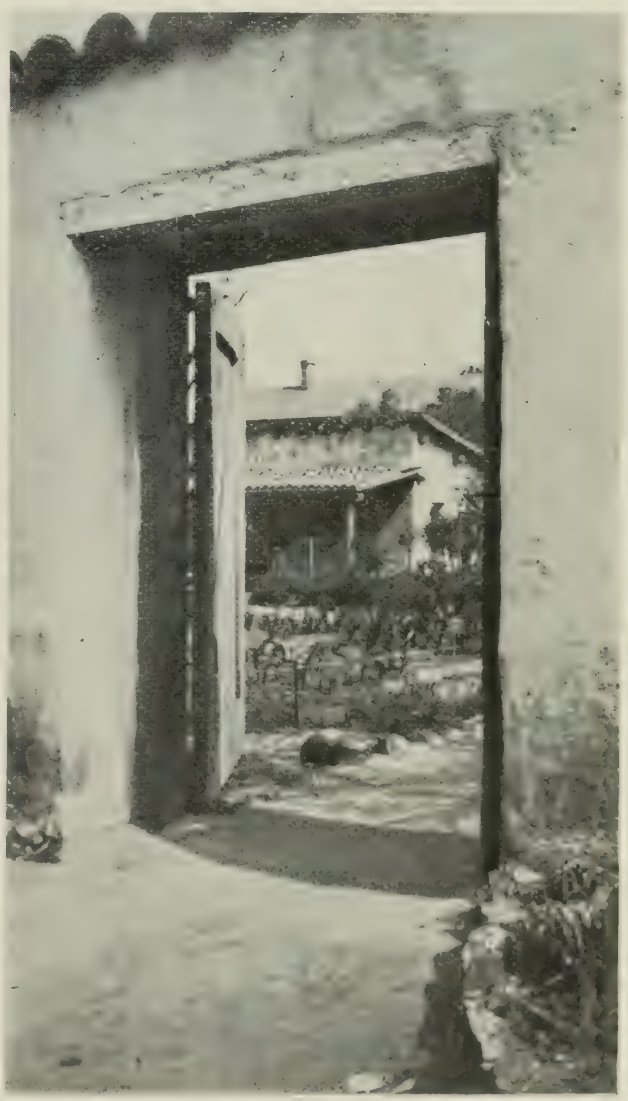
Each dot represents a place where university representatives in person carried on educational work in 1911-2. Correspondence course centers are not included.

The Origin of the General Strike

The idea of a general strike for political purposes has been attributed to a certain William Denboro—a follower of Robert Owen and successively a cobbler, publisher, bookseller and coffee-house keeper. In 1831 Denboro wrote a pamphlet entitled, *Grand National Holiday and Congress of the Productive Classes*, advocating the stopping of all work for a month as a lesson to the capitalist class. The idea was taken up, seven years later, by the Chartist Convention, who favored keeping a "holy month" to induce Parliament to grant their demands. And this was followed by the "plug riots" of 1842, in Lancashire, which crippled the cotton industry.

An Insect Anesthetist

That the sting of the wasp which punctures the nerve centers of a captured caterpillar or spider usually paralyzes the creature into helplessness, rather than kills it, is well known. The victim remains alive in the burrow or cell in which the wasp stores it as food for the larva which will emerge from the egg laid in the same cell. Therefore the newly hatched grub finds ready for it a provision of living meat instead of decayed carrion.



That "wizard" among entomologists, the venerable Fabre, has discovered a similar, yet even more extraordinary fact, in the history of the glow-worm beetle (Lampyris); namely, that it anesthetizes the prey upon which it itself feeds, so that it may consume it at leisure, and predigested. This beetle, whose brilliant phosphorescence attracts the eye in the dusk of summer evenings, habitually hunts and seizes upon a certain small snail in order to eat it. The curious thing is that the beetle anesthetizes the mollusk at the first attack, preventing it from escaping by withdrawing to safety deep within its shell. Upon finding the snail, the beetle dashes forward, and thrusting out its sharp, curved mandibles, repeatedly stabs the side of the body of its prey. After a few punctures the snail becomes insensible, and remains in that deadened state for three or four hours—a time more than sufficient for the beetle to complete its meal.

Capitalizing the Best Seller

News comes that a $100,000 hotel in El Centro, California, is to be named the *Barbara Worth*, after the heroine of a "best seller" written by a resident of that section and describing the Imperial Valley, of which El Centro is the metropolis.

This is not the first time that a work of fiction, having won popularity, is capitalized. The most notable instance is that of *Ramona*, which is a sort of auxiliary Baedeker of Southern California, and which has given a name to countless hotels, apartments and commodities of all sorts. As Ramona was quite a tourist herself, according to Helen Hunt Jackson, there is a "Ramona house" in nearly every Mexican settlement in the southern end of the state, among them several "birthplaces," for like William Tell and Homer, this dusky maiden of fiction was born simultaneously in a number of places. The chief commercial venture based on her popularity among tourists is "Ramona's Marriage Place" in the Mexican "Old Town" of San Diego.

This old adobe building has been restored and furnished in a style approximating its appearance in the days before the *gringo* came. One can enter by paying a modest admission fee, and doubtless even purchase souvenirs and picture post cards. The house is maintained as a regular show place and the street cars bear the sign "To Ramona's Home." Fiction pays.

RAMONA'S MARRIAGE PLACE, SAN DIEGO

THE WEEK

California and the Japanese

Formal protest against California's alien land bill was submitted to our Government on the 9th by the Japanese Ambassador. It was understood that Japan asked for quick action. There were reports that an appeal to our courts was suggested, and also that arbitration at The Hague would be demanded if an adjustment of the controversy could be reached in no other way. On the following day there were conferences between the Ambassador and Secretary Bryan. An impression prevailed that the situation was regarded by our Government as one of much importance. The bill was then in the hands of Governor Johnson, his action upon it having been delayed at the President's request.

In a telegram sent by Mr. Bryan on the 11th, the President appealed to Governor Johnson, virtually asking him to veto the bill. Baron Chinda, the Ambassador, he said, had presented "an earnest protest." He passed over questions relating to treaty rights because the bill was avowedly intended to conform to treaty obligations, and because "any conflict complained of would be a matter for the courts," but he felt justified in expressing a desire for delay. The legislature could be reconvened at any time. He was impelled by a sense of duty to express the hope that the Governor would "see fit to allow time for diplomatic effort."

The nations affected, he continued, were friendly nations that had shown themselves willing to co-operate in the establishment of harmonious relations. If a postponement should commend itself to the Governor's judgment, he (the President) would be pleased to assist in "a systematic effort to discover and correct any evils that may exist in connection with land ownership by aliens."

It was said in Washington that the President hoped for a withdrawal of the bill. But the passage of it by almost a unanimous vote did not seem to indicate that withdrawal could be procured by a mere request for delay. But little time was left for action by the Governor. Bills recently introduced at Sacramento, providing for an enumeration of the Japanese, and for an official inquiry as to the lands owned or leased by them, are not, it is said, to be pressed for passage.

Tariff Revision

The Tariff and Income Tax bill was passed in the House on the 8th, by a vote of 281 to 139, substantially without amendment. A few verbal changes recommended by the committee had been adopted. Only five Democrats voted in the negative. These were Messrs. Broussard, Dupré, Morgan and Lazaro, of Louisiana, and Charles B. Smith, of New York. Fourteen Progressives were counted with them, and four in the affirmative. Two Republicans, Mr. Carey and Mr. Stafford, of Wisconsin, were counted for the bill. It is now in the Senate, but has not been referred to the Finance Committee. When an attempt to refer it was made, there were indications that five Democrats would support a Republican motion for hearings. Therefore an adjournment until the 13th was taken. At the end of last week it was understood that a majority of the five had been induced to oppose hearings. The debate in the Senate will consume about two months, and the final vote will not be reached before August 1. It is now proposed that the wool schedule shall become effective on November 1 and the remainder of the tariff changes on January 1.

Several foreign Governments have protested against the proposed discount of 5 per cent on goods imported in American ships, and the Ways and Means Committee was advised by the State Department that treaties would be violated by such a discount. This did not restrain the House from adopting it. Certain manufacturers have said that the reductions will compel them to reduce wages. The Department of Commerce will make an investigation, if any wage reduction is announced, and it will begin its inquiry in the pottery industry. On the day when the bill was passed, Mr. Underwood spoke of the purpose of the Department, which, he said, had power to walk into the offices of the manufacturers and to ascertain whether there was any real reason for cutting wages, or whether it was "merely a selfish attempt to put money in their own pockets."

Washington Notes

In November, 1908, President Roosevelt by executive order placed 14,000 postmasters of the fourth class under the protection of the merit rules. Last October, President Taft added the remaining postmasters of that class, about 36,000 in number. Some Democrats asserted that his purpose was to keep Republicans in office. By executive order, on the 7th inst., President Wilson amended the orders of his two predecessors by directing that the postmasters affected must demonstrate their fitness by submitting to competitive examination. As 12,000 of those in the service were appointed in accordance with the merit rules, the number of those who must qualify is about 38,000. Those who receive less than $180 a year, however, will be appointed upon the recommendations of postal inspectors.

The Senate, last week, passed the Sundry Civil bill, with its rider virtually exempting combinations of workingmen and farmers from prosecution under the Anti-Trust law. Because of this rider the bill was vetoed by Mr. Taft. Mr. Wilson, it is asserted, will sign it. The vote was 41 to 32.

John Purroy Mitchel, president of the New York Board of Aldermen, has been nominated to be collector of the port of New York, to succeed Collector Loeb. This appointment does not eliminate Mr. Mitchel as a candidate for the office of Mayor of New York.

One Hundred Years of Peace

Plans for the celebration of the century of peace between Great Britain and the United States were nearly completed in last week's conferences between twenty delegates from England, Canada, Newfoundland, Australia, and the municipality of Ghent, where the treaty was signed in 1814, and the American committee.

Lord Weardale, chairman of the British delegation, and his colleagues, were elaborately entertained in New York from May 4 to May 10, when they left to visit Boston, Washington, Philadelphia and other cities. They were received by Mayor Gaynor, feted by Mr. Carnegie, chairman of the American committee, dined by President Butler, of Columbia, entertained by Mr. Roosevelt, and otherwise kept busy between business sessions at the Hotel Plaza.

All nations have been now invited to participate in the festival. In England the anniversary will be marked particularly by the purchase of Sulgrave Manor, in Northamptonshire, the ancestral home of the Washington family. Relics of George Washington will be placed there, and a permanent memorial established.

Details of the American celebration are not yet announced, tho plans have been carefully worked over. An international bridge over the Detroit River at Detroit, a series of monuments along the Canadian frontier, many parkways, exhibits, perhaps a museum and an exchange of professorships and scholarships are suggested. The aniversary of the treaty, December 24, 1914, will be commemorated by simultaneous exercises in Ghent and thruout the English-speaking world.

Railroads for Alaska

Several witnesses were heard, last week, by the Senate committee which is considering the bill for an issue of $35,000,000 of bonds to be used in building railroads in Alaska. Gifford Pinchot, formerly Chief Forester, said that legislation for the development of Alaska's coal resources by a leasing system had been prevented by ex-Senator Guggenheim and others. He thought the Government ought to build and operate railroads in Alaska, and lease the coal mines. James F. Callbreath, secretary of the American Mining Congress, said that Mr. Pinchot was responsible for the restraint of development. The pending bill had his approval, but he opposed the leasing of coal deposits.

Walter L. Fisher, formerly Secretary of the Interior, said development had been prevented by Congress, which had failed to give the needed legislation, altho it had repeatedly been informed as to the requirements of the situation. The Government, he added, should build railroads from tidewater to the interior. Roads would be constructed by private capital only to the coal and copper mines, which are near the coast. O. L. Dickinson, the manager of an English company associated with the Guggenheim syndicate in the Copper River railroad, said his company intended to open a water and rail route this year as far as Fairbanks. It would be ruined by a competing Government line.

The Philippine Islands

There is a controversy between Dean C. Worcester, secretary of the Philippine Commission, and the resident Filipino delegates at Washington, because of a letter in which Mr. Worcester referred to slavery in the islands. The Legislative Assembly failed to pass laws prohibiting the enslaving of persons and providing punishment, altho urged to do so by the Commission. There-

fore the latter past such a law, in 1911, but it was applicable only to the provinces occupied by the non-Christian tribes, over which the Commission has exclusive legislative control.

In a published statement, Delegate Quezon, having said that Secretary Worcester had asserted, in a letter to the President of the American Humane Society, that slavery existed in the islands, declares that the asertion is "both false and slanderous." Slavery does not exist, he says, in that part of the archipelago subject to the legislative control of the Assembly. If Negritoes are held in slavery in Manila, he does not know it, and such slavery is illegal. If there has been slavery there, he continues, the Commission is to be blamed for not putting an end to it. Mr. Worcester, he adds, is unwilling that the Filipinos shall have independence, because then he would lose his place, and therefore he slanders the people and seeks to show that they are unfit to govern themselves.

Mexico

General Huerta, provisional President of Mexico, is angry because the United States has failed to recognize his Government formally. Therefore he has said to Ambassador Wilson that while he would still regard him as a personal friend and would welcome him as a guest, he would not continue to treat him as a diplomatic representative. At the same time an intimation was given that until the Government should be recognized at Washington, the American claims for damages would not be taken up. Our Government, it is understood, intends to withhold formal recognition until after the constitutional election, which is to be held in October. Its policy as to this matter has prevented Huerta, it is said, from negotiating a loan, and his resentment has excited opposition to American residents at the capital.

In the north, last week, the rebels were gaining. Altho the Federal garrison at Guaymas had been reinforced by 2000 men, who came by sea, this force was defeated and Guaymas was captured. It is said that twenty-five of the Federal officers, who had been made prisoners, were put to death. The surrender of General Trucy Aubert, at Lampasos, in Nueva Leon, with several hundred Federal soldiers, was announced. A train carrying 250 Federals was wrecked by dynamite, and 200 were killed. The services of 400 Japanese residents were offered to the rebel commanders but were not accepted. In the south, Zapata made two unsuccessful assaults upon the city of Cuernavaca.

Other Countries South of Us

Diplomatic relations between Great Britain and Guatemala will be severed, it is asserted in dispatches from London, unless Guatemala, by the 15th inst., responds to the demand for a settlement of her foreign debt. The British Government holds that its agent in this matter, Sir Lionel Carden, has not been treated with due courtesy. It is understood that Guatemala will get no aid at Washington.

Nicaragua, whose Minister of Finance is now in this country, is trying to negotiate a loan of $4,000,000. The sum advanced by New York bankers when it was thought that the loan treaty would be ratified at Washington, has been spent in reforming the currency. Representatives of Nicaragua now in Washington have asked President Wilson and Secretary Bryan to define their attitude toward the loan treaty and the treaty which grants to the United States a naval station and exclusive control of the interoceanic canal route, in consideration of the payment of $3,000,000. Mr. Bryan has not given a final answer. Owing to the President's views about "dollar diplomacy," Nicaragua finds it very difficult to borrow money.

A committee of Cuban Liberal Congressmen has complained to President Gomez about the partisan hostility of the rural guards in Santa Clara. Orestes Ferrara, formerly Speaker of the House, said he would resign on account of this hostility. The President said he would inquire and would also confer with President-elect Menocal. The latter told Ferrara that he would restrain the guards from meddling in politics, and therefore Ferrara reconsidered his determination to resign.

Hayti's Congress has elected Michel Oreste, a Senator, to succeed the late President Tancrede Auguste. Before and after the election there was much disorder at the capital. General Defly attacked the building in which Congress holds its sessions. Regular troops repelled him and he sought refuge at the Cuban Legation. In this controversy seventeen men were killed. Political exiles are returning from Jamaica, and some expect a revolution. It is reported that Auguste died of poison, given to him in his food, and that several members of his family narrowly escaped a similar fate.

Brazil has restored the tariff preferential concession of 30 per cent, on certain imports from the United States, which was suspended or withdrawn because, it is alleged, our Government attacked the coffee valorization project in a Trust suit, and compelled the sale of 900,000 bags of coffee stored in New York.

The English Suffragets

Willoughby H. Dickinson's bill to enfranchise some 6,000,000 women (who would, if men, enjoy the right to vote) was defeated on its second reading in the British House of Commons on May 6, by an adverse majority of 47. In spite of Mr. Asquith's opposition, several members of the Government supported the measure: Sir Edward Grey, Chancellor Lloyd George, Mr. Birrell, Mr. Buxton, Sir Rufus Isaacs, etc. Most of the Irish Nationalists voted no. On the Unionist side, Mr. Bonar Law, the titular leader, and Mr. Balfour, refrained from voting. Only one front-bench Unionist supported the suffrage bill, whose defeat is blamed by the London *Times* and other journals upon the violence of the militant suffragets, who continue to burn and to plant bombs. And on Sunday (May 11) riotous scenes attended the attempt of the Men's League for Woman's Suffrage to hold a meeting in Hyde Park.

The burning of St. Catherine's Church at Hatcham, in the southeast of London, on the 6th, is credited to the militants. The loss is estimated at $100,000. Attempts to explode bombs outside the Grand Hotel, opposite Trafalgar Square, and inside St. Paul's Cathedral, were frustrated last week. Other incendiary fires are reported. A militant suffraget entered the offices of the London *Standard*, a journal strongly opposed to the extension of the suffrage, on the 5th, injuring furnishings and attacking one of the editors.

Votes for Frenchwomen

Certain propaganda have never taken root in France in the past, for example, those of the Salvation Army and the Woman Suffragists. Apparently the latter is now taken more seriously, however. Mrs. O. H. P. Belmont declared, when she sailed from New York recently, that she was going to help Christabel Pankhurst establish a Paris branch of the Women's Social and Political Union, the militant organization, if it seemed advisable.

Deputy Joseph Reinach, the leading temperance advocate in France, declares that a true universal suffrage, including women, "will one day be the result of our campaign against the national peril—alcoholism. It was to wipe out this scourge that the Scandinavian countries gave the vote to women. Men have but one way of repelling the apparently inevitable accession of women to municipal and then to national life, and this way is promptly to vote anti-alcohol laws, limiting licenses, prohibiting absinthe, and suppressing distillers' privileges."

Georges Clemenceau, formerly prime minister, declares his open hostility to the reform—which, in France, remains an academic rather than a practical issue. According to M. Clemenceau women would restore the Middle Ages. This veteran anticlerical pays womanhood the compliment of crediting her with irrepressible religious instincts, and adds that in France she is too submissive to the priest to enjoy political privileges without bringing about a return of the Church Triumphant. In his youth M. Clemenceau was a pronounced radical; today his conservatism has gone far enough to enable him to say: "For my part, rather than give the vote to women I should prefer to take it away from certain men. But," he adds with a smile, "don't make me say that in the newspapers." The suffrage for women might well prove beneficial in Protestant countries where individualism is highly developed, but in France, according to M. Clemenceau, it could only hasten the decadence into which all the Catholic nations of Europe have successively fallen.

France's Army and Fiscal Deficit

The French Prime Minister, Louis Barthou, announced on May 5 the Government's decision to maintain under arms for an additional year those conscripts who would normally (under the two-year service) return to civil life on October 1. Parliament has just reassembled, and Mr. Barthou has stated that he stakes his ministerial life upon the voting of the return to three-year conscription.

The Government is said to contemplate raising a large loan. A deficit of $160,000,000 is faced, according to experts. This figure is the combined deficits calculated for 1912 and 1913.

A Peace Conference at Berne

On May 11 an informal congress of 218 parliamentarians of France and Germany meeting at Berne, Switzerland, voted unanimously a resolution repudiating "patriotic excitability" and demanding a decrease of armaments. The resolution continued:

"The conference warmly supports the proposal of the American Secretary of State, Mr. Bryan, relating to arbitration treaties, and demands that disputes between France and Germany shall be submitted to The Hague."

The representation of French Deputies and Senators was considerably larger than that of members of the German Reichstag: 185 Frenchmen against only 33 Germans. This is partly accountable by the fact that

the French Chamber of Deputies is a much larger body than the Reichstag. Most of the members of the German delegation were Socialists, including Herr Bebel, leader of that party in the Empire. France was represented by members of the arbitration group and the Socialist party.

Baron d'Estournelles de Constant, a pacificist member of the French Senate and known to the readers of THE INDEPENDENT as a contributor, presided over the Berne Congress. In an interview given to a Paris newspaperman, the Baron exprest himself as under no illusions as to obtaining immediate results. The conference was held at the invitation of Deputies of the Swiss Parliament, acting unofficially.

The King of Spain in France

Alfonso XIII of Spain visited Paris last week, and with President Poincaré reviewed French troops at Fontainebleau, and on another day the French military aircraft. Great precautions against his assassination were taken by the police.

A closer understanding has, it is thought, been arrived at by the two Latin nations whose chiefs met at Paris. Count Romanones, the Spanish premier, told the representatives of *la Liberté,* of Paris: "Today Spain and France have reached a friendly agreement. Tomorrow the two countries may take a further step. The understanding we have attained is the result of mutual effort."

During the last few years France and Spain have had certain disagreements in Morocco, but these have been practically if not altogether adjusted by concessions on both sides. The Spanish Government recently announced a program of military and naval expansion, and the country is in a more prosperous condition than has obtained in a great many years. The French press, with the exception of the organs of the Socialists, welcomes an *entente,* and would welcome an alliance, adding as it would a possible 200,000 to the defensive forces of France, and tending also to make Spain a more promising field for the investment of French capital. It is, however, announced by the Madrid *Tribuna* that King Alfonso and Emperor William of Germany will meet in Holland this summer.

Ex-King Manoel and the Republic

The ex-King of Portugal has become engaged to his second cousin, the Princess Augustina Victoria of Hohenzollern, oldest daughter of Prince William of Hohenzollern, head of the older princely branch of the house. This non-reigning branch is Roman Catholic, and is not directly related to the Kaiser's.

Ex-King Manoel is now twenty-three years of age. His accession to the Portuguese throne came about thru the assassination of his father and older brother in 1908. In October, 1910, a republican revolution overthrew him, the motive of the revolutionists being wholly political and anticlerical and not (as has sometimes been represented) based upon the profligacy or unpopularity of the young ruler. Since his deposition Manoel has lived with the Queen-mother at Woods Norton, Evesham, England, as the guest of the Duc d'Orleans. Woods Norton has been the residence of more than one legitimist claimant to the French throne. The republican government has allowed the ex-King a pension of $3300 a month, and since his deposition it has been rumored more than once that he was paying court to various royal highnesses. The Princess Augustina Victoria is twenty-two years old, one and a half years younger than her fiancé. Her family is rich and finances the Rumanian throne, whose present occupant, King Charles, is a member of the house. In 1870 the candidacy of another Prince of Hohenzollern for the Spanish throne proved one of the incidental causes of the Franco-Prussian War.

The ex-King of Portugal declares that he will soon return to the throne, and royalist activity is continuous. The abortive uprising at Lisbon on the night of April 26, was, however, chiefly the work of a group of malcontents called the Radical Republican Federation: that is allied with the Syndicalists. Revolvers and bombs were fired, but no one seems to have been hurt, tho 150 arrests were made. The London press publishes accounts of indignities to which, it is alleged, royalist prisoners are treated, and rumors of the republic's instability are current: as they have been ever since its foundation more than two years ago.

The inadequacy of the news received from that part of Europe makes it all the easier for partisans to color what little news does reach the outside press. The daring release of a number of prisoners arrested on April 27, during political disturbances for which a radical wing of the Republican party was responsible, was effected on the 29th. Armed men boarded the cruiser Republica in Lisbon harbor and released the prisoners. The connivance of certain officers and men aboard the war ship made this coup possible. As a result of the disorders two monarchist and one Socialist journals of Lisbon were suppressed and two hundred political prisoners arrested at the same time have been sent to the Azores for trial in a fortress there.

ADVERTISING AFFIRMATIONS
BY GEORGE FRENCH

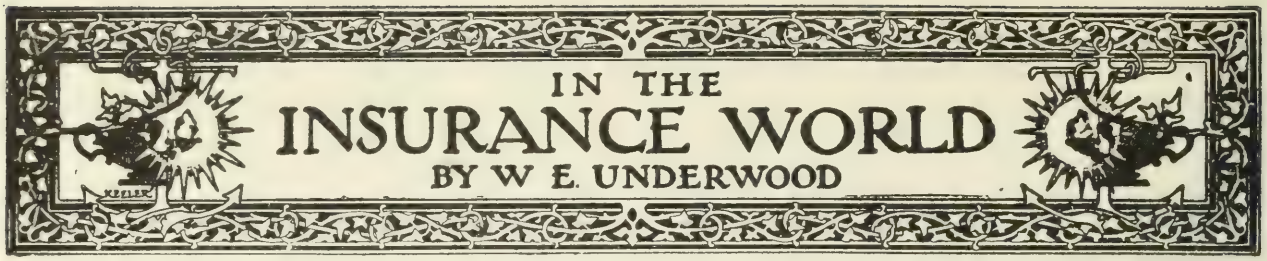
XII—Effective Advertising

There is danger that the rising profession of advertising may become too sophisticated. It has not yet established itself as either an art or a science. That it is even a profession is implied more because of the kindly sufferance of those whose favor or disfavor may affect it than because of a definite position it has attained thru its recorded achievements or the standing of its chiefest exponents. It is, in other words, an art in the estimation of a few enthusiasts; a science, in embryo, in the minds of a few students; a profession by virtue of the courteous consideration of the publications that profit by it and the businesses that owe their existence to it.

Yet, with nearly all of its permanence to win, there is danger that the efficiency of advertising may be impaired by the too rapidly maturing process of conventionalization which of late has been making headway.

Advertising campaigns are being too frequently planned to utilize methods and formulæ developed from the experience of managers and agencies. Too much advertising copy is being written to conform to unstable canons that have come into use thru narrowed observation of the results of different advertisements under different conditions with different people. Too many advertisements are being constructed to justify the ideas of designers who do not work with an eye single to the major object of attracting the attention and influencing the action of the readers thereof.

The single purpose of advertising is to influence the actions of readers—of a particular body of readers. It is therefore of supreme importance that the constructor of an advertisement know the people to whom he intends to appeal, and that he make his appeal straight to them. Ninety-nine in every hundred readers are quite ignorant of all the sophistications that have clustered themselves about the advertising business, and of this 99 per cent 99 per cent again are artless enough to accept the statements of the advertisement at their apparent face value. They do not recognize, nor estimate, the subtle evasions or the insinuating leadings of the expert copy-writer's art. They do not grasp the professional significance of illustrative suggestion nor understand the force of typographic implication.



It is beginning to be understood that the force which moves people's minds to action is a simple and transparent thing. The advertisements that excite the admiration of the advertising profession are apt to be ignored by the people whose patronage is desired. The advertisements that "pull" are apt to be those which appeal to professionals with the least force.

Something passes from the successful advertisement, along the optic and sensory nerves, to the brains of readers, and there presses some subtle button and sets the will at work along the lines of the requests or demands of the advertiser. What is this something?

It is the human interest note, is it not? It is the human interest appeal. It is not the artistic illustration, nor the clever typography. It is that which the advertiser says to the advertisee. The most effective advertisements that ever have been printed have been the simplest, in design and form, those about which there was no physical distinction other than their absolutely austere avoidance of every grace supposed to be added by illustration and typographic complexity or beauty; those written in the clearest and most restrained language.

This has for a long time been well known by advertisers. They have been fully aware of the phenomenal success of advertisements of the type of the Rogers Peet Company classics. They have seen the power to bring business exerted by the careful and explicit statements of such as the Chalmers advertisements. They have known of the swollen fortunes brought to patent-medicine men thru their bald, unvarnished and ungarnished statements. But the great majority of advertisers have continued to spend much money for illustrations that convey little intelligence to the readers, typography that too often obscures and perverts the intent of the text, and copy that is calculated to arouse in the breasts of the readers emotions not closely allied with the buying impulse.

The effective advertisement depends for its power upon its manifest sincerity, its reasonableness, its clarity of statement, its power to attract, and its reading qualities. Its attractive element is what gives it its initial value; but it must lead on and not be conclusive or satisfying. Its suggestion must follow quickly upon attraction, and its selling argument must be delivered before the glow of the attraction has faded from the promise of the suggestion.

Advice to Life Insurance Policyholders

Life insurance policyholders who have not already done so should lose no time in writing to their representatives in the United States Senate protesting against any taxation whatever of their life insurance interests thru the income tax section of the Wilson-Underwood tariff bill, which is now up for consideration by the Senate. In this department last week we clearly demonstrated to the satisfaction of every just and impartial mind that the accumulations of the life companies are not only not income nor surplus, but that they are expense funds. They are income absorbers, not income producers.

The authors of the income tax provisions of the bill exempted fraternal and benevolent life insurance associations from its operation. Why did they do this? We ask that question, not for the purpose of impugning their motives, for all such funds should be exempted, but because we should like, if possible, to follow the line of reasoning that results in a conclusion to absolve a form of accumulations under one name and to hold it under another name. Both are the result of mutual coöperative effort on the part of the accumulators; both represent outgo—expense—and both have the same object in view. It seems clear to the legislative mind that fraternal beneficiary funds should not be taxed, and it is a little puzzling that the level premium reserve system should not be entitled to the same advantages. Both these forms of beneficence are entitled to the highest consideration which legislation can confer on them, and it should be obvious to the crudest judgment that neither should be burdened with taxation in any form.

New Lamps for Old

Among the many letters we receive from readers asking for advice and guidance in life insurance matters, we continue to find the usual proportion of them on subjects which indicate the operation of that small class in the agency field known as "twisters," gentlemen who thrive by substituting new policies for old ones. Under the benign influences of corrective legislation, backed by the good work of underwriters' associations, the practice of "twisting" has been greatly reduced within the last ten years, but it has not been exterminated. There yet remains in the ranks a class of agents who are more skilful at undoing the work of their predecessors than in building for themselves.

We know that many policyholders are not properly equipped with life insurance. They either have too much, or it is under plans which are too expensive, or it will mature too early or too late, or it is in inferior companies—there is something about it which, all of the policyholder's circumstances considered, makes it less serviceable to them than it might be. These points are eagerly seized on by the "twister" and, unless the insured is level headed, the former will do a piece of profitable business. The "twister" in life insurance is the modern counterpart of the wicked magician in the Arabian Nights tale of "Aladdin and His Wonderful Lamp," who, having located the lamp in Aladdin's palace, provided himself with a number of common copper lamps and, disguising himself as an itinerant salesman, circled the palace, continually crying, "New lamps for old; new lamps for old." His generosity, it will be remembered, won the custodian of the wonderful lamp, none other than the Princess, Aladdin's bride, who lost no time in exchanging the real thing for its counterfeit. So it becomes necessary for policyholders generally to treat with great care the propositions made by the life insurance agent who offers new policies for old.

The instances are extremely rare in which a new policy is better than an old one—or as good. A man spends not only money on a policy. He puts some of the years of his life into it. He may be able to square the financial side of it some time, but he can never again be the age at which he took a policy he has carried for some years. Some other sort of policy, or one in another company, might have been better at the time, but once made, such mistakes are difficult to rectify years later. The one way to avoid these mistakes is to start right. Get the proper policy for the proper amount at the proper premium in the right company. Then keep it. But if you have not got just what you want, if it has any age, four or five years

or more, don't be seduced by the peddlers who have new life insurance lamps to swap for old ones. Consult some disinterested person of character and knowledge of the subject. No mistake will be made by putting the cause or causes of dissatisfaction before the company in which the insurance is carried.

Foley-Walker Compensation Bill

The New York legislature has adopted that one of the four workmen's compensation bills before it which is probably the best one from the viewpoint of practicability. In many respects it resembles the New Jersey law, a statute which experts in the matter pronounce superior to any thus far enacted in this country. With inexplicable inconsistency the New York assembly passed two workmen's compensation bills, the Murtaugh-Jackson and the Foley-Walker, the provisions of which are in direct conflict with each other. But the senate voted down the first and adopted the last named.

A vigorous protest against the approval of the Foley-Walker bill has been made to Governor Sulzer by the leaders of union labor interests, and there is no assurance that the Governor will not veto it. He has invited all those interested in the legislation to appear before him at an early date in the future to discuss the subject. If the Governor finally refuses to approve the bill, the state of New York will continue without any workmen's compensation law for another year, unless the subject is considered at the extraordinary session of the legislature which commences on June 18. It is understood, however, that nothing will come before that session but a primary election bill.

The antagonism in union labor circles to the provisions of the Walker-Foley measure do not seem, on mature consideration, to be well grounded. The labor leaders are uncompromisingly opposed to any compensation law that permits the casualty companies to transact any portion of that business. They endeavored to make a case against the companies by citing the experience of injured workingmen under the form of employers' liability insurance, when as a matter of truth, employers' liability insurance has never undertaken to provide indemnities to the employee. Narrowed down to its prime office, that form of insurance runs to employers only and is an undertaking on the part of the company to stand between that interest and all law suits for money damages arising out of injuries received by employees or other persons. All litigation of this character occurred under the common law and the defenses permitted thereunder were availed of by employers and their insurers.

But the principles of workmen's compensation reverse all this. It makes the employer liable outright. It permits of no defense whatever. It specifies in detail the exact amount of damages incurred, and from this dictum there is no appeal. The employer has the bill to pay, and in that way the cost of compensation becomes a part of the operating expense of every business. As an individual factor, the average employer is unable to bear this burden. He therefore seeks an insurer. The casualty companies stand ready to grant the indemnity, and they can do it without depriving the workman of any benefit the law grants him. The companies must get such profit as they make out of the business from the employers.

As nearly as we are able to arrive at a judgment in the matter, the Foley-Walker law would make a good beginning in this state toward the formulation of a proper system of workmen's compensation. It probably falls short of all it should be, but as its defects become apparent they can be remedied by future amendment.

Notes

A committee of the New Jersey legislature is about to make an investigation of the fire insurance business in that state.

The District Court at Washington, D. C., has confirmed the Commercial Fire Insurance Company's valuation of the Southern Building at $2,000,000.

Governor Baldwin of Connecticut has carefully studied the workmen's compensation bill pending in the legislature of that state and has advised the committees in charge that it is satisfactory.

Charles G. Smith and Charles H. Coffin, for several years past secretary and assistant secretary, respectively, of the German American Insurance Company of New York, have been elected members of that company's board of directors and appointed vice-presidents.

The Insurance Commissioner of South Carolina, who seems to have some fancy ideas as to how the insurance business should be run, has issued a circular letter to companies advising that he will not hereafter issue licenses to agents until after he has received a letter from the appointing officers stating that the latter know the appointees to be fit and proper persons to be licensed.

FINANCE & TRADE

A Favorable Crop Report

Our largest crop of winter wheat has been that of 1906. In that year 492,000,000 bushels were harvested. A greater yield is promised this year. The Government's report, issued last week, shows that the high condition reported a month ago, 91.6 per cent, rose to 91.9 on May 1. The ten years' average for that date had been only 85.6. Loss due to winter-killing was only 1,449,000 acres, against 6,469,000 last year, and the area is now 30,938,000 acres, an increase of 16.4 per cent over the harvest area of last year. The Government says a yield of 513,571,000 bushels is now indicated. To this, of course, will be added the yield of spring-sown wheat in the Northwest. Last year's crop of winter wheat was 399,919,000 bushels. It is quite probable that there will be 500,000,000 bushels in 1913.

In respect to other products the report was highly favorable. The condition of rye is 91 per cent, against a ten-years' average of 89.6, and a record crop is promised. Pasture land condition is above the average. On the first of the month 67.2 per cent of the spring plowing had been finished; last year's figures were 52.8. Of the spring planting, 57 per cent had been completed, against 48.9 last year, and a six-years' average of 54.3. All reports thus far point to bountiful harvests.

Condition of Business

The effect of the impending tariff changes upon trade and manufactures has thus far been slight and almost imperceptible. Inevitable readjustment to meet the new conditions suggests caution, of course, and buying for consumption some months hereafter is restricted to some extent. The steel industry resists any depressing influence. Pig iron output continues to be large. But the Corporation's unfilled orders on hand, as reported last week, show a reduction of 490,000 tons. The textile industries protest against the reduction of tariff duties. Work at the largest mill in Fall River has been suspended indefinitely, but it is not asserted that this is due exclusively to tariff legislation. Short time has been ordered at a large carpet factory in Massachusetts, owing to a decline of orders, due, it is said, to the desire of buyers to wait for the effect of tariff changes upon prices.

Several associations of manufacturers have said, by resolution or otherwise, in their protests against projected reductions of duties that these changes must cause reductions of wages. This is the assertion of the makers of hosiery, underwear, cotton duck and pottery. Notice is given by the Department of Commerce that such reductions, if made, will be the subject of official investigation.

The securities market, last week, was in a stagnant condition. Neither the favorable crop report nor the passage of the tariff bill in the House appeared to affect prices, net changes in which, as a rule, were small. Only 1,349,850 shares were sold, against 2,498,415 in the week preceding.

Currency Legislation

After a conference with the President, Representative Underwood said, on the 8th, that currency legislation would be taken up in the House on or about June 1. It is understood that Mr. Wilson, who will send to Congress a message on the subject, would like to have the legislation enacted at the present session. But Democratic Senators say that the Senate will not be able to pass a banking and currency bill in addition to the tariff revision. This is also the opinion of Mr. Underwood. But there ought to be, and there is to be, a beginning of the work, in the House, where the members of the new Banking and Currency Committee will soon be appointed.

At its meeting last week, the Executive Council of the American Bankers' Association adopted a resolution saying that banking and currency legislation was of "paramount importance," and urging that "such legislation should be had at the earliest possible moment, so as to be of service when the changes which are about to take place in the general fiscal policy of the Government are put into effect." But the new tariff will be in force some time before currency legislation can be enacted.

The Pennsylvania Railroad system has asked manufacturers to bid for the construction of 12,300 freight cars, the cost of which will be about $16,000,000.

California and Japan

California, thru her Legislature and her Governor, utterly refuses to yield to the exprest wish of the President of the United States that a law against the Japanese should not be enacted and signed. They say their honor is at stake, and they flout the superior national will. President Wilson says to Governor Johnson, Please do not sign it; and the Governor replies to the President, I will.

This is a condition that could not occur in any other respectable nation on the face of the earth. In France, the national will would be supreme over the will of any of the departments. It is the fault of our Constitution, which is so over-careful of the rights of states that it allows a state to provoke war, while forbidding it to make war. If a state does injury to a foreign nation, the nation cannot prevent it. It is perfectly powerless, as the present condition shows. But when a foreign nation is thus injured, it cannot complain to the state that has done the injury, or make reprisals or make war against it; it must complain at Washington, and Washington has to answer with all humiliation that she cannot help it. This is, as we said last week, a most painful and unfortunate condition, and it ought to be corrected by an amendment to the Constitution.

Governor Johnson has the Constitution on his side. Under it this most unwise law can legitimately be enacted. We can find nothing unconstitutional in it. In words it is not against the treaty with Japan, which is as superior to state law as is the Constitution. The law forbids the holding or leasing of land, except as allowed by the treaty. That need not have been put in, for if it were not in, the supremacy of the treaty would still remain. The courts will have to decide it, but we presume the decision would be that Japanese can own buildings for manufacturing or mercantile business or for residence, but not for agriculture.

The correspondence which comes to us shows the utter unreasonableness of the law. It is not needed. There is no such danger of the Japanese capturing California, as is pretended. A letter from the very center of that strawberry district occupied by Japanese shows how limited are their possessions of land and shows the hostility to the law of the white people there.

There will be no war. Japan wants none and we want none. To fight across the Pacific would be no easy task. There is every reason why Japan should not go to war against us. What may happen, however, is the loss to us of the friendship of Japan and the special honor which she has given us among the nations. In his reply to the protest of Japan, Secretary Bryan makes it plain that this action of California must not be understood as that of the nation, which is as friendly as of old; he could say little more.

The silly act of Arizona backing up California makes no diplomatic difficulty. That is a general law and its prohibition is against all aliens who do not announce their intention to become citizens, and it applies to all aliens, to English as well as

Japanese, and it affects few Japanese, but a good many Mexicans. Mexico would protest, if there were any Mexico now to protest. Why insult the nations? It is chiefly a lack of manners.

Peace Conferences

Three peace conferences have been held in the United States this month—the fourth American Peace Congress at St. Louis, the conferences in New York of the British and American national committees for the celebration in 1914 of one hundred years of peace, and the Lake Mohonk Conference on International Arbitration.

The Anglo-American Conference has proved a great success. A celebration is now fully assured which will profoundly affect not only the peoples of the United States, Great Britain and their colonies beyond the seas, but all the nations of the world.

The various proposals that have been made, such as the establishment of scholarships, the interchange of professors, editors and men of affairs, the erection of bridges, monuments and roads, the rewriting of historical textbooks, have been referred to in our last issue. It seems to us, however, this century of peace furnishes to England and America an unparalleled opportunity to inaugurate a permanent, all-comprehensive, obligatory arbitration treaty, which shall insure henceforth eternal peace among the English-speaking peoples of the earth. We rejoice, therefore, that Mr. Bryan and Sir Edward Grey are at the heads of the foreign offices of England and America. No more sincere and devoted friends of peace exist in the world today.

The American Peace congresses and the Mohonk Arbitration conferences are now generally recognized as the most influential national peace gatherings in existence. The Peace congresses meet biannually and are supported by the recognized state and local societies of the country, about seventy in number. The St. Louis congress is the fourth to be held, the first having met in New York in 1907, the second in Chicago in 1909, and the third in Baltimore in 1911.

The Mohonk conferences have met for the past nineteen years at the top of Mohonk's precipitous mountains. Until this year the 300 delegates assembled as the personal guests of Albert K. Smiley, and there in a three days' session listened to addresses by the foremost statesmen of the world on peace and arbitration. This year Mr. Smiley no longer greeted his guests. He died last December. But his younger brother Daniel acted as host and proposes to carry on the conferences in the future as they have been in the past. We have on more than one occasion urged that Albert Smiley be crowned with the Nobel laurel. He probably had done more, directly and indirectly, for the peace of the world than any other American. Men of good will can never repay the debt they owe to the Smiley brothers.

If the resolutions at the St. Louis congress showed more courage and leadership than at Mohonk, the addresses at Mohonk were of a higher general level. Both congresses urged Mr. Bryan to ask the governments of the world to inaugurate at once the international preliminary committee to prepare the program of the Third Hague Conference in 1915. Mohonk urged the immediate establishment of the judicial arbitration court and the abolition of the right of capture of private property at sea. St. Louis approved Mr. Bryan's plan for standing international commissions of inquiry, which far exceed in importance the commissions of inquiry created by the Hague conferences. St. Louis also urged the repeal of the Panama Canal tolls act, and failing that, arbitration. It came out squarely against the militia pay bill and those "insidious efforts to extend military training to the public schools, and to make naval recruiting stations of our colleges and universities." It urged the President to negotiate with foreign Powers for an international agreement to arrest military and naval rivalry.

The chief way to hasten the golden age of peace is to do between the nations what has already been done within the nations; that is, to enthrone reason and dethrone force as a means of settling disputes. These two conferences have fully seen the light, for the able addresses and resolutions devoted most of their attention to the perfection of the

Hague conferences and courts, and the broadening of the principles of arbitration and the extension of good will among men.

No Dirty Compromise

One of the most blessed results of giving the ballot to women is that it will mean a fight to a finish against the hateful commerce of social vice in our cities. Men have created it, and good men have excused its existence, saying that it is hopeless to fight against it, that it attaches to human nature, that it is the oldest of all professions—which it is not, for hunters and fighters and herdsmen and farmers were older—and that it will continue till the end of the world. Therefore, they say, make it as inconspicuous as possible, pen it in its own place, segregate it, and thus compromise with the admitted but necessary evil.

But he who compromises with the Devil has already submitted to the Devil. He is already apologizing for the Devil and is his adviser and friend. Next he will damn the female victim and excuse and protect her destroyer. He reverses the order of responsibility and crime. This is the doing of men, and now that women have awakened to their power, they will compromise no more. It is their votes and influence that have decreed the total suppression by law of the evil in California, and their service will be predominant in the States where as yet they have no vote. It is so just now in Chicago; it is so in Philadelphia.

Oh, but we are told, do not drive these women out of their old haunts, where they have been protected by the police, for they will overflow into hotels and tenement houses and spread the corruption. They cannot be a week at their vile trade in the tenement houses and hotels without it being known, and again they can be quarantined out of business. Where there's a will there's a way. Where it has failed in the past it is because there has not been the will to succeed. A new determination is evident and the people will demand utter suppression.

But we are told that these women will flee from Philadelphia to Camden and Atlantic City. Then let Camden and Atlantic City refuse to receive them, and force them into honest employments. This is a crusade which must spread over state and nation. There must be combination; and yet every city and every state that conquers makes so much gain, just as it is in the other prohibition movement.

But we are told that it is cruel thus to treat these poor victims who must not starve. Who would have them starve? They will not be allowed to starve. Already temporary homes are offered for those who cannot return, as many do, to their old country homes, or can find no employment. Here the women are doing a good work. They have more mercy than the men have. It is pure mercy to get them, even to force them, out of this sad business into which they have been driven by men's deception.

The greatest, the most startling moral movement before us is this new and sudden crusade against this old form of slavery. It has not yet reached the political platform, but it will be in all of them at the next elections. The women will put it there, for it attacks the pre-eminent crime against womanhood. They will stand no compromise. They will allow no excuse, no hesitation, no fear of failure, for there can be no paltering with this moral and social plague. "To doubt would be disloyalty, to falter would be sin."

The New Gospels

It is rather curious that the American public should depend on a cabled abstract of an article in the London *Times* for information as to the contents of an ancient manuscript of the Gospels, purchased in Egypt by Charles L. Freer, of Detroit, edited by Prof. H. A. Sanders, of the University of Wisconsin, and printed in this country in facsimile and with full critical notes. It is a sumptuous volume and belongs to theological libraries.

Readers must not trust to the headlines of even sober newspapers. It is hardly true that it adds verses to the Gospels, and yet it is true that it does contain an interpolation after verse 14 of the 16th chapter of Mark. This is interesting tho not very important, for, as the Revised Version indicates, the conclusion of

Mark's Gospel, verses 9-20, while old, was not written by Mark, but was added by another very early writer to supplement the very abrupt ending of the Gospel at verse 8. It has been suggested by some—among them by Westcott and Hort—that the original ending of the Gospel, perhaps the last leaf of the manuscript, was lost in the first century. Two different endings are found in ancient manuscripts, one which in the Revised Version is separated from the rest of the Gospel by a blank space, and another shorter one which we translate as follows:

> But all the things which had been told to those with Peter they immediately proclaimed. And after these things Jesus himself thru them sent out, from east to west, the holy and uncorrupted proclamation of eternal salvation.

The authority for this second ending, altho it is ancient, is much less than for the usual ending. A few years ago a manuscript was found which ascribed the familiar ending to Ariston. This Ariston would appear to be identical with Aristion, mentioned by Papias as one of the earliest Christians known to him. He probably lived in the first century, and was a credible witness of the teaching of the apostles, as Mark was of that of Peter.

The interpolation in the Freer manuscript after Mark 16:14 is not found in any other manuscript, and yet there is evidence that it was known to Jerome. After we are told in verse 14 that Jesus upbraided the disciples for their unbelief and hardness of heart because they had not believed those who had seen Him after He had risen from the dead, the manuscript continues by giving their apology, as follows:

> And they excused themselves, saying that this age of lawlessness and unbelief is under Satan, who thru the agency of unclean spirits suffers not the true power of God to be apprehended.
>
> "For this cause," said they unto Christ, "reveal now at once thy righteousness."
>
> And Christ said unto them, "The limit of the years of the power of Satan is not fulfilled, but is drawing near." [Here the text is corrupt.]
>
> "For the sake of those who sinned was I given up unto death, that they may return unto the truth and sin no more, but may inherit the spiritual and incorruptible glory of righteousness in Heaven."

This is, as we have said, an interpolation, most probably into the appendix to the Gospel of Mark, reported to have been written by Aristion. It was added, we may presume, when the early Church had begun to give up the expectation of the speedy return of Christ to the earth, as an explanation of his delay, and is valuable simply as a record of the change of view in a very early period.

The Freer manuscript will be valued as one of the oldest authorities for the New Testament text, but it is of interest chiefly to those who classify the manuscripts by families, as Syrian, Constantinopolitan, etc., and who pursue textual studies rather than historical or theological. We are very glad it belongs to this country. Russia possesses the Sinaitic manuscript, Italy the Vatican, England the Alexandrine, and now this new discovery belongs to the United States. We thank Mr. Freer for securing it and giving it to the nation, to be deposited in Washington. Portions of the Old Testament had previously appeared.

Public Drinking Water and Health

The laws that have been enacted in many states in the last year or two forbidding the use of the common drinking cup or glass as formerly provided undoubtedly make for the prevention of the spread of disease and are well calculated to accomplish great hygienic good. As yet, however, conditions have not adjusted themselves so as to prevent certain abuses that might be even more dangerous to health than were possible under preceding conditions, and special precautions need to be taken to avoid them. A typical example of some of these evils occurred in connection with the large crowd assembled in Washington for President Wilson's inauguration. In the early morning the soldiers at the great Union Station, impatient at the delay in securing the individual drinking cups provided by the vending machines, and perhaps a little vindictive over the necessity for paying each a penny for one, smashed the glass covers of the apparatus with their rifle butts and distributed the cups. Later in the day, tho there was an abundance of drinking wa-

ter, there was no means of obtaining it, and the crowd had to go thirsty.

Under such circumstances, and it must not be forgotten that they develop practically on every holiday near a large city, there are always sure to be unfortunate incidents of this kind, and unless special provision is made to meet the emergency there is danger of much more than merely the temporary suffering due to thirst, tho that may be bad enough. To make it difficult for men and women in large crowds such as this to procure water may be a serious menace to health besides involving certain ethical dangers thru the obvious temptation to drink alcoholic liquors more than would otherwise be the case.

It is probably too much to expect that people will generally pay a cent for drinking cups every time they want a drink of water. There are many who hesitate even at spending that much money. On railroad trains such people can be seen any day, as a rule, using some of the paper cups that have previously been employed by others. Almost needless to say, this is a much more dangerous practice than the common use of a drinking glass, for from the smooth surface of the glass any bacteria or other harmful products that are present are readily washed, while they cling rather more tenaciously to paper than to the smooth edge of the glass. Probably the best corrective would be the gratuitous provision by railroads of cheaper paper cups. As it is, certain of the railroads, especially in New England, are supplying such paper drinking vessels gratis to travelers, and thus all danger of passengers re-using them is put out of the question.

There are some rather dangerous abuses connected with the small drinking fountains that are sometimes supplied for stations and schools and institutions in which the pressing of a spring gives a little jet of water from which to drink. Any one who has watched children in a school, or workmen in the hurry of the noon hour at a public fountain, or, above all, foreigners in a railroad station, will have noted that many of them actually touch the portion of the apparatus from which the jet of water comes with their mouths. This, of course, makes the newer state of affairs more dangerous than the former. It would be very difficult, however, to train the great majority of these classes mentioned to drink without this contact. The fountains must be so arranged that contact and consequent contamination is impossible.

These questions of a public supply of drinking water without the danger of the spread of disease are very important. Last summer was the first in which laws to prevent the use of the common drinking cup were enforced in many states. For the coming summer we must put in practice the lessons learned from experience, and boards of health should be ready to suggest means to prevent the abuses that have been pointed out. It must, above all, not be made difficult for people to get water in abundance during the hot weather, for there are many physical as well as moral dangers connected with any limitation of this kind.

Church Union

Not this year do the Southern Presbyterians and the United Presbyterians unite. They have to refer to their presbyteries the plan they have agreed upon. They are very near alike, have the same government, and are both very conservative in theology, and on the one matter of practice on which they differ, singing of hymns, the plan allows liberty, the only basis of union anywhere.

That three Presbyterian assemblies should have agreed to meet in Atlanta is evidence that union is in the air. There may be a hitch in the proposed union of the German Reformed Church with the Northern Presbyterians, for there are those on the Reformed body who think their natural alliance is with certain other bodies of a freer government, such as the Congregationalists, but the latter have been too busy for six years with schemes of centralization to be able to give attention to the more important matters of Church union. It is to be hoped that this interruption will be ended at the meeting of the National Council next October, and that they can get to better business soon.

The conferences of the Episcopal committee on unity with unofficial delegates

from other denominations have continued, and *The Churchman* has printed the provisional agreement with the Disciples. This has raised a storm among the Disciples, for the plan included a quasi approval of the Apostles' Creed, while the Disciples are very stiff on denying the value of any basis except the Bible. Then the agreement included the acceptance of bishops or some such superintendents, definitely consecrated; and that the critics have so severely assailed that the Disciples who accepted it have hastened to show that there was in the agreement no promise to approve it. They met their brethren with all Christian charity, but bound neither themselves nor any one else.

The Episcopal commission had a meeting last week with seven Congregationalists, equally unofficial, and presented to them the basis of union as it had suffered various amendments in sessions with the other denominations, and no difficulty was met until they came to the article which required that the ordination of ministers should be by three ministers and a bishop, and the consecration of bishops by three bishops. To that they refused to be bound, standing on liberty, and believing that it involved the imposition of a superior order of bishops, having functions that could not be borne by others of the clergy. On this matter the conference concluded without an agreement.

We must learn the old lesson that the only basis for union is liberty on matters of difference, even as Paul insisted at the first council in Jerusalem.

Guatemala's Debt

One aim of what was called dollar diplomacy during Mr. Taft's term was to enable Central American and West Indian republics to pay their just debts. When the Wilson Government turned a deaf ear to the appeals of Guatemala, this did not necessarily indicate repudiation or abandonment of the preceding Administration's policy.

Guatemala borrowed several millions in London many years ago, promising that her export tax on coffee should be used in paying the interest. It was so used for two or three years, but then the payments were discontinued. For fifteen years the bondholders have received nothing. When Great Britain recently demanded interest, Guatemala asked our Government to protect her. Why should it have intervened? Guatemala has been at peace for some years and is able to pay.

A British cruiser was sent to one of Guatemala's ports, and then the debtor yielded. Interest payments from the coffee tax have been resumed. The Taft Government never sought to prevent enforcement of a just obligation in Santo Domingo or elsewhere. It would not have held that Guatemala should not be required to pay interest on a loan. It might have given aid to promote honest collection of the owing country's revenue, or might have assisted the debtor to negotiate a new loan, if one were greatly needed. This is what it sought to do in Honduras and Nicaragua.

Governor Sulzer's Fight

When William Sulzer became Governor of New York there was some doubt in the public mind as to his attitude toward those in the State who exerted the most powerful influence in his party. We refer to Charles F. Murphy, the Tammany leader, and those associated with him either in the great city or elsewhere. Mr. Sulzer had for many years represented in Congress a Tammany district. Therefore it was said that he must have been in accord with the Tammany leaders. Some remembered, however, that on one occasion, when those leaders attempted to force his retirement, he fought them successfully, winning because the Democrats of his district liked him and believed that he had been a faithful and efficient representative.

No one entertains a doubt now as to his attitude toward the Tammany boss. The Democratic platform, on which he was elected, demanded a state-wide primary law and pledged the Legislature to adopt such amendments as would simplify and perfect existing statutes relating to primaries. At the recent session a primary bill was passed which Governor Sulzer vetoed, denouncing it as a

fraudulent makeshift. His own bill the Legislature rejected. Whereupon he called a special session and began to fight for the passage of a bill like that which had been thrown back to him.

All who have followed his course since this special session was called will admit that he is a fighter. He has planned a campaign, procured the aid of many of the strong men in the state, and is straining every nerve to win, because, as we believe, he is convinced that the legislation he demands is needed in the interest of honest politics and good popular government. Among those who will assist him are Mr. Roosevelt, Mr. Mitchel (whom the President has made Collector of the port of New York) and Mr. McAneny, the president of the city borough of Manhattan.

In his public utterances concerning this contest he is frank and emphatic. He does not hesitate to use the names of Mr. Murphy and Mr. Barnes, the latter being a well-known Republican leader. We quote passages from a signed statement published a few days ago:

> I appeal to the people of New York to support me in this fight. They must choose between the Governor they have elected and the bosses, like Murphy and Barnes, who fear direct primaries because their political character, their ability, their mentality and their political honesty cannot stand the searchlight of publicity. The vast majority of the people of New York, irrespective of parties, are in complete sympathy with state-wide direct primaries. I appeal to all of them, to all honest men who want to see their state rescued from the slough of corrupt politics. The will of the people cannot be freely exprest if they have to vote for candidates picked out by corrupt bosses—mere tools of invisible government. Let every man who values his vote join with me to drive the bosses out of business. The only people who fear direct primaries are those who are in politics for plunder and those who hope to gain special privileges from invisible government; men who are but the creatures of other men and not the servants of the people.
>
> The session of the legislature that has just ended has made one thing plain. Every voter in the state now knows that Murphy, on the Democratic side, and Barnes, on the Republican side, between them hold the legislature of the state in the hollow of their hands, and that the elected representatives of the people do not dare to vote according to their consciences or according to what they know the people want, unless permitted to do so by the bosses. The reason is that they know they can never be renominated, under the existing convention system, except by the favor of these same bosses.
>
> Those who would subvert the powers of government to personal advantage and special privilege find their greatest opportunities to do this evil work in the dark manipulations and hidden deals of political conventions. These conventions must go. They are repugnant to the spirit of progressive Democracy. It is the scandalous failure of state conventions faithfully to reflect the sentiment of voters; it is the brazen deals and the open trading by which the people's interest has so often been bartered and the people's will so often defeated, that have at last aroused the people of this state to the imperative necessity of real state-wide primaries.
>
> We are going to have them. As Governor I am going to lead this fight and I am going to stay in it till it is won. I know the powers that I have; I know the agencies at my disposal. All of those powers that I can honestly use, all of those agencies, will be used to defeat and crush the Democrats who are attempting to make the Democratic party of New York a political hypocrite and to place it on a pedestal of public scorn.

This indicates that, as we have said, the Governor is an earnest and vigorous fighter. His foes in his own party are beginning to see it. Some of them have recently lost unofficial positions of political influence. Others are turning from the old leadership which he denounces. And he is fighting for a good cause, in the state which contains nearly one-tenth of the country's population. It is a contest which must excite in other states the interest of all who would promote honest popular government and the downfall of bosses. The Governor and his associates deserve their sympathy and aid.

The Rockefeller Foundation

The endowment, which is to receive a hundred million or more dollars, and is to control Mr. Rockefeller's beneficences, has received its incorporation from the Legislature of New York, after Congress had refused to incorporate it, altho all the safeguards which ingenuity could devise had been put into the bill. We are very glad this is done. It assures a good use for a large gift, which might otherwise have been wasted on pleasure and display.

Its value to the world depends on the objects to which the income is to be devoted and to the intelligence and good

purpose of the men who will direct the expenditure. Both seem secure as anything can well be. The purposes are good and the control is in safe hands.

The object to which the income of the fund will be applied is stated in the more general terms: it is "to promote the well-being of mankind thruout the world." Mr. Rockefeller cannot tell now what will be desirable a hundred years hence, and so he puts no dead hand on his money. In accomplishing this object the foundation may use research and publications, establish and maintain charitable, benevolent, religious, missionary and public educational activities thru agencies already established and otherwise. There is no restriction here. It can aid education in Louisiana or in Persia. It can carry on medical research or it can finance peace. It can explore Greenland or exterminate rattlesnakes, or saloons, or brothels. It can pension Presidents, or Senators, or authors, or mothers. It could aid and protect Liberia or Turkey, when threatened by a creditor nation, or it can establish a mission to civilize the Moros of Mindanao. No taint can attach to the money; and the field is wide, and there is no limit to the call for the use of the income. It will be easy to spend four or five millions a year, and yet much ignorance and wrong will be untouched.

And the men in charge can be trusted. They are both intelligent and altruistic. They are Mr. Rockefeller himself and his son, who is devoted to the correction of social evils; President Judson, of the University of Chicago; Dr. Flexner, director of the Rockefeller Institute of Medical Research; Frederick T. Gates, chairman of the General Education Board; Jerome D. Greene, one of the Board of Overseers of Harvard University; Starr J. Murphy, member of the General Education Board; and Wickliffe Rose, general agent of the Peabody Education Fund. They are men who have been connected with Mr. Rockefeller's educational and benevolent organizations, and are all tried and wise men. They are men of large views and broad human sympathies, and will perpetuate the services to which the money has been consecrated.

Thus is the custom benefiting the world by which unusual wealth is given back to the advantage of those who were partners in its creation. Such an example did Smithson make, and Girard, and Peabody; until, as larger accumulation became possible, Mr. Carnegie and Mr. Rockefeller have joined in the happy rivalry of unparalleled benefactions. Great wealth involves great responsibilities, which can never be met by those whose outlook is confined to one's own household and the keeping up of a family name.

One Small College

That the small college would again come into its own and would continue to hold its own, notwithstanding the growth of the great universities, has not generally or seriously been doubted among those close to the educational situation. The small college has its own distinctive work to do and at no time for a generation or more has the American small college of the better sort shown so much vitality as it exhibits now. It is concentrating its activities upon essential things. It is notably improving the quality of its teaching; and especially it is taking more seriously than ever before its responsibility for character building in the student body. That this improvement all along the line is attributable, in large measure, to a wholesome standardizing pressure exerted by the great educational foundations is frankly recognized. But other influences—spontaneous, generous, voluntary—have coöperated, and these, happily, are becoming every day more varied and effective. Most interesting, as an example, is the form which the movement to create a fitting memorial to the late John Bigelow has assumed. Instead of the conventional monument, his friends and admirers will build at Union College, from which he was graduated in 1835, and of which, for many years before his death, he was the oldest living alumnus, a John Bigelow Hall, devoted to the studies he loved—history, politics and literature—and will found a John Bigelow professorship of political service. A remarkable body of men makes up the committee in charge, namely, Oswald Garrison Villard, of the New York *Evening Post*, the treasurer, to whom contributions will be sent; Joseph H. Choate;

Justice Charles E. Hughes, of the United States Supreme Court; J. Pierpont Morgan, Henry Fairfield Osborn, George A. Plimpton, Eliphalet Nott Potter, Andrew Carnegie, Elihu Root, John L. Cadwallader, Joseph E. Ransdell, and President Richmond, of Union.

Union College, founded in 1795, and therefore one of the venerable colleges, has had a curiously interesting history as a pioneer in educational movements that have made good. A Christian college, it took the lead, as its name was intended to proclaim, in a liberal policy of emphasizing the essentials of religious life that make for unity of social service among the denominations. First to recognize the educational value and to foresee the practical importance of natural science, it established a scientific course leading to a B. S. degree of academic value equal to the older A. B. Its school of civil engineering is known the world over for the thoroness of its training, and now, in the field of electrical engineering, it offers, in connection with the works of the General Electric Company as an unrivaled laboratory, and under the instruction of Dr. Steinmetz, the wizard of electro-physics, unique opportunities.

In these experiments, Union has not sacrificed the humanities. It is indeed best known as the alma mater of men distinguished in literature and in public life, among them John Howard Payne, the author of "Home, Sweet Home," to whose memory the beautiful gateway stands at the campus entrance; Lewis H. Morgan, of the class of 1840, whose studies of "The League of the Iroquois," "Systems of Consanguinity and Affinity in the Human Race," and "Ancient Society," laid the foundations of modern ethnology; John Bigelow, William H. Seward and Chester A. Arthur.

That the college of such achievements and such men should inspire affection and loyalty and hold public confidence is in the natural order of things, and there are hundreds of small colleges, scattered thruout this great land, each of which, in its own way, has "deserved well of mankind." Let us indulge the hope that the example which has been set by the friends of John Bigelow in thus identifying the memory of a great man with the college of his love and veneration, may extensively be imitated.

Belgian Immigration

Closely following the strike in Belgium, we learn that a company of leaders, including many capitalists, have come over to America, and have bought fifty thousand acres of land in the center of Florida. The purpose is to divide the purchase into small farms and carry on agricultural work with the intensive thrift for which the motherland is famous. In Belgium six hundred and fifty people to the square mile are well fed and enjoy more comfort than one-fourth that number in other parts of Europe. It is a sort of immigration that we heartily welcome, and we are glad that the flux turned toward the United States instead of South America, where the better part of European migration has found an outlet of late.

Florida will not quarrel with them in behalf of "Crackers," or tourists, or negroes. No better investment could be made than to sell these Belgians all the land they want, at the lowest possible figure, for home making, and rent them as much more as they can use. It is the shortest and easiest way of closing the discussion about "undesirables" from Southern Europe, and it may tend somewhat to relieve the fear and fret concerning Orientals. When some one complained to Lincoln about troublesome politicians, he replied that the only way to deal with politicians was to set off one class against another. Instead of fighting foreigners who are of a low grade, or making the whole country uncomfortable for ourselves as well as them, is it not possible that our best policy is to make them prosperous homesteaders, fusing one class with another and Americanizing them in the resultant. We could take care of one-half of Belgium and of Holland, and we are not sure but a large slice of Japan at the same time would help us along in the way of thrift and industry. The absorbing of foreigners goes on much more safely as well as readily when several sorts or races are fused. So far we have been able to infuse the resultant with considerable of the spirit of the Declaration of Independence and the Golden Rule.

In Brief

We have a letter from Frederick Roy Martin, Assistant General Manager of the Associated Press, as to an article by Mrs. Older in THE INDEPENDENT in which she declares that the public has known little about the strikes in West Virginia "because the sources of information have been in the hands of the operators," and because the provost marshal at the trial of Mother Jones was the Associated Press correspondent. Mr. Martin declares that "the provost marshal was not the Associated Press correspondent and never had been," and, further, that an inspection of the thousands of words sent by its correspondents during the strike will show that the news was covered "amply, accurately and fairly."

What a curious thing it is to be a negro! There was J. W. White, D. D., editor of the *Georgia Baptist*, a newspaper, who died the other day and is praised as a noble and leading negro. But he was white by name and white in skin. He never knew that he had any negro blood. He thought it likely that he was as a cast-off baby, adopted by a negro woman and grew up as a negro and with negro sympathies, of course. A drop of negro invisible blood is usually supposed to be prepotent over thirty one-thirty seconds of white blood. It is to laugh.

It often takes a long time to get a case of substantial justice thru our courts. The Maryland legislature enacted in 1904 a "grandfather" law which excluded negroes from the vote in municipal elections. Now, nine years later, a district court, three judges sitting, has declared the law unconstitutional. A similar decision by another Maryland circuit court some years ago still awaits action on appeal. In the present case, curiously, one of the judges who declares it unconstitutional was chairman of the committee which prepared the act.

A woman, Mrs. Cora W. Stewart, is superintendent of schools in Rowan County, among the mountains of Kentucky. She thinks it possible to eliminate all illiteracy in her county. The teachers made a list of all illiterates, a thousand or more of them, and interested them in "moonlight schools." In two years the number of illiterates has been reduced to a few hundreds, and they plan to wipe out the last vestige of illiteracy by the end of the year. That is a practical plan. It will work.

Our Post Office Department does its best to prevent the circulation of lottery matter in the mails, but when circulars are sent in plain sealed envelopes it is not easy to detect them. A Danish lottery concern is sending such circulars here and they have come to us mailed from Berlin and Frankfort in Germany, apparently to escape action against them in Denmark. As with the horse-racing business in this country all devices must be used to escape the law.

The one organization that plainly utters violence and war is the Industrial Workers of the World. Haywood is rejected by the Federation of Labor and the Socialists. It is the speakers of the I. W. W. that threaten to put cities in darkness, and we know what that would mean; they threaten to wipe Paterson off the map if they do not get their way. They are enemies of society, and their leaders have no right to complain when imprisoned for inciting to riot.

Secretary Lane is right in asking that the Government should build and operate railroads in Alaska. New York State owns the Erie Canal; the nation owns the Panama Canal. Most other civilized nations own railways. We own railways in the Philippines. Private capital cannot profitably open up such a territory as Alaska.

We guess that the proposal laid before Congress, as in the interest of peace, by a Congressman from Texas, that we should cede to Great Britain the panhandle strip of Alaska along the sea-coast which we purchased from Russia is not likely to go any further, unless it is to take the form of an exchange of territory.

General Chang is visiting England on the opium business. He says that in China the British prestige is falling because of opium. America, he tells them, gave them back the Boxer indemnity, and gave them recognition, while Great Britain gave them opium. But Great Britain will give it no more.

We are glad to record to the honor of the present British Government that it has decided that India shall no more impose opium on China. That wrong will end forever. But China agrees to take over the 20,000 chests of opium now lying in the treaty ports at the rate of 2000 chests a month.

The Swiss have just amended their constitution by putting sanitary power into the general government instead of localizing it in the cantons. The object is to make it possible to check tuberculosis, cancer, goitre, puerperal fever and feeble-mindedness. More centralization, and more benefit.

Japan in 1913

The Influence of the Late Emperor—Progressive Tendencies—Religious Co-operation—Commercial Advance

By Dr. Daniel Crosby Greene

[For many years THE INDEPENDENT published a yearly survey of progress in Japan. Until his death two years ago Dr. DeForest always wrote it. We are pleased now to have it written by Dr. Greene, the dean of the missionaries in Japan.—EDITOR.]

The one event of the past year which has overshadowed all others has been the death of His Majesty Mutsuhito, who will take his place in history as Meiji Tenno, or as we should say, the Emperor Meiji.

The time has not come for a just estimate of the part which the late Emperor played in the national government. The profound reverence for his person and time-honored custom alike have led to a strong emphasis upon him as the determining factor in all the great questions which have arisen since the Meiji Era began. No Sidney Lee has appeared, perhaps none will ever appear, to portray the Emperor as he revealed himself to those who stood nearest to him, and the information which reaches the people is fragmentary. He led an isolated life, and while many in high position speak confidently of his deep interest in public affairs and his administrative influence, an intelligent man whose name has an honorable place in the official calendar as a direct appointee of the Emperor, when asked what this influence was, replied, "We do not know."

It is reported on excellent authority that the Emperor himself believed in his own divinity, and that when the anarchist plot was discovered a year and more ago, he wished to save the men who had sought to take his life, saying it was more his fault than theirs, for he had not protected his divinity as he ought.

It is quite generally believed that altho he rarely took the initiative in governmental affairs, yet since his formal sanction was essential to the validity of all important measures, he did give a certain steadiness to the public policy; for only with the greatest reluctance would he recede from a decision once made.

Certainly few monarchs have been more widely or more sincerely mourned than Meiji Tenno. His name will always be associated with an era of the greatest interest, not merely to the historian, but to the student of ethnic psychology as well; for the key to the history of the Meiji Era will be found in what the late Professor James called "energy-releasing" thoughts which lay back of all the changes culminating in New Japan. The very chiefest of these, the new conception of the value of the individual, has opened up the path to advancement before the humblest in the land and unlocked stores of latent energy whose ripest fruit is not yet seen.

The new Emperor is believed to be of a widely different temperament from his illustrious father. During his youth and early manhood he was sadly handicapped by illness, but of late years his physical health has greatly improved. He is understood to desire to lessen the rigorous etiquet which has hitherto characterized the court and to approach more nearly the life of a European sovereign.

The dramatic close of General Count and Countess Nogi's life must needs be recorded. It is difficult to strike the right note here. On every side men speak tenderly of their memory; but there is a wide conviction in thoughtful minds that their suicide was a not unnatural, but nevertheless a sad mistake. Their graves have been visited probably by hundreds of thousands, both young and old, and their death has formed the text of many an impressive sermon on loyalty and patriotism; but after all it has awakened a strong protest on the part of men whom the nation is more and more recognizing as the prophets of the new era.

The resignation of Marquis Saionji on December 5, occasioned by the insistence of the Minister of War upon a plan for

creating two new army divisions, involving an increase of the army by, say, 20,000 men, to be stationed in Korea, has led to a bitter struggle. What attitude the new Premier will assume toward the question is not yet known.

On the resignation of Marquis Saionji, there was much difficulty in selecting a successor. Count Terauchi (pronounced Tera-uchi) was thought by many to be the natural choice, in that he was the most prominent among the so-called bureaucratic candidates; but it was made very clear that the Seiyu Kwai (The Society of Friends of Constitutional Government, that is, the Liberal party), which has an undisputed majority in the Diet, would organize a strong opposition. Hence, after much discussion among the Elder Statesmen and the rejection of several proposed alternatives, it was decided that Prince Katsura must again become Minister-President.

Prince Katsura, on the death of the late Emperor, had been made Lord Keeper of the Privy Seal and Chief Counsellor to the new Emperor, and had retired, finally as was believed, from politics, but in the emergency he consented to try his hand once more. On taking office he recognized the fact that he must win to himself a strong following in the Diet. Accordingly, while not stating with distinctness his position regarding the increase of the army, the question which occasioned the fall of his predecessor, he declared a policy which in the main was apparently not less liberal than that of the Liberals themselves. In this way he attracted to his standard a number of prominent men who were undoubted radicals, and sought to create a new party.

This program belongs properly to the history of 1913, but it may be said in passing that while for a time Prince Katsura appeared to have a fair chance of success in creating a new party which should control the Diet, yet in spite of his liberal platform he did not draw to himself any considerable number of men from the Liberal camp. On the contrary, for reasons not yet fully known, the hostility to his movement assumed a most bitter character, which revealed itself in the deplorable riots of February 9. The resignation of Prince Katsura followed and Admiral Count Yamamoto has been ordered to form a new Ministry, but so far he has not succeeded. Whatever may be the success of Count Yamamoto, it would appear that the influence of the Genro (Elder Statesmen) is waning and that something approaching the British system of parliamentary government must before many years prevail; for the traditions of the Imperial House cannot readily be harmonized with the German system of constitutional government, which requires a more public exercise of imperial functions than Japan has seen for many centuries.

It is an interesting coincidence that this contest should assume this energetic form when the liberal movement in Great Britain and the Progressive movement in the United States, not to speak of other lands, are gaining such powerful headway. In all these countries, whatever may be the specific measures immediately in view, the main purpose is to bring the government into more direct connection with the will of the people. It is a new illustration of the fact, abundantly illustrated before, that Japan is, for good or ill, rapidly yielding herself to the great world-waves of thought and feeling which dominate the countries of the West.

The so-called Three Religions Conference, held in February at the suggestion of the then Vice-Minister of Home Affairs, Mr. Tokunami, one of the most respected of the younger men in official life, was a serious attempt to induce Shintoists, Buddhists and Christians to recognize their common responsibility for promoting the moral well-being of their country. There was no thought of asking any one to abandon cherished beliefs or to enter into engagements which would hinder the propagation of one's own religious principles. As the result of extensive travels, Mr. Tokunami had been convinced of the important part which religion has played and still plays in the life of Western lands, and especially was he impressed by the value of the reinforcement which it gives to the ethical movements of the day. This reinforcement he and his associates wished to secure for Japan in much larger measure than hitherto.

The conference was attended by repre-

sentatives from all the prominent religious bodies in Japan, excepting the Eastern branch of the Shin sect of Buddhists. The Western branch, or perhaps one ought to say the parent stock, from which the Eastern was an offshoot (tho today they are of almost equal strength), cordially coöperated. Naturally the value of such a conference is not susceptible of definite measurement; but one is justified in the belief that frictions have been relieved and that a feeling of mutual respect is gradually taking the place of the old-time distrust among these widely differing bodies.

Incidentally the conference embodied a recognition of Christianity such as it has never received before. While no special advantage has perhaps accrued to the Christian churches in the large centers of population, in the country districts evangelistic work has of late been less hampered by local prejudices.

An alleged conspiracy on the part of a large number of Koreans against the life of the Governor-General, Count Terauchi, which had been under investigation since the latter part of 1911, has attracted much attention during the past year. As the result of the preliminary examinations, confessions of guilt on the part of 106 persons were reported to the court of first instance; but at the public trial all but seven retracted their confessions, claiming that they had been extorted from them by torture. The remaining seven asserted that the so-called confessions were made, not under physical torture, it is true, but under pressure and misapprehension, and that their statements had been perverted. These also denied all complicity with any plot. All were convicted, but immediately appealed, and the result of the appeal will undoubtedly be known to the readers of THE INDEPENDENT before this article appears.*

There has been much severe and apparently just criticism bestowed upon the lower court; for, while perhaps not overstepping the technical limits of its legal powers, it would appear to have been extremely arbitrary in the exercise of its discretion, in that it limited itself almost exclusively, so far as evidence was concerned, to the records of the preliminary examination and the statements of the defendants, who were not, it is understood, allowed to avail themselves of any supporting evidence in the conduct of their defense. It is a pleasure to report, on the other hand, that the appellate court, which has nearly concluded its proceedings, has not only listened with very great patience to the not always relevant statements of the defendants, but has allowed large liberty to their counsel, both as regards the summoning of witnesses and the presentation of their pleas. This procedure has won no little praise from all sides.

If we turn to business affairs, we have to note a foreign trade totaling yen, 1,145,920,000; *i. e.*, imports, 526,980,000, and exports, yen, 618,940,000. The increase over the previous year was, for imports, yen, 79,540,000, and for exports, yen, 105,130,000. The import of raw cotton alone rose to the unprecedented amount of yen, 200,000,000, an increase of yen, 50,000,000. As regards domestic trade, the year passed quietly, but apparently with a larger volume than ever before. The marked feature was the extraordinarily high price of rice, which during the latter part of 1909 had fallen to $1.10 per bushel, but which last year for a time stood at $2.50. The crop was above the average and this naturally led to a decline in price; but it would appear that the causes of this abnormal condition of the market are too deep-seated to be overcome by any increase of production to which Japan can reasonably look forward, and that her people must gradually accustom themselves to a diet in which rice will take a secondary place.

This account of the year should not close without reference to Captain Frank Brinkley, R. A., who died in Tokyo October 28. He came to Japan in 1868 as an officer of the legation guard of the day, but soon after was engaged as instructor in the Naval College. Since 1878 he had been editor of the *Japan Mail*. As an all-round student of Japanese affairs he had no superior, and as an authority on certain departments of art he had won a world-wide reputation. He was a sincere friend of Japan and he fought her battles with unflinching loyalty.

Tokyo, Japan.

*The release of all but six of the defendants on appeal was noticed in THE INDEPENDENT for March 27, 1913.—EDITOR.

Starve the Fly

By Richard M. Winans

The national slogan of last year was "Swat the Fly!" And it was a good slogan, too; as a "slogan."

For 1913 the seemlier and more practical slogan of "Starve the Fly!" has been adopted by the National Committee of Fly Fighters.

Under the anti-fly crusade to be waged during the fly season of 1913 some really effectual results will surely be accomplished. It is along the right line. It will more nearly attain the end really sought. The "Swat the Fly" campaigns of recent years convincingly achieved the original purpose. That was signally to attract public attention to the fly as a deadly plague; to stimulate worth-while work in the destruction of breeding places; to inaugurate a campaign for better sanitation. The fly-swatting activity of former years resulted in widespread public agitation, which in time secured for these crusades a general and very liberal newspaper publicity, and all this dragged the fly into a merciless limelight.

But Mr. Edward Hatch, Jr., of New York City, chairman of the fly-fighting committee of the American civic Association, and originator of the Swat the Fly campaign, has consistently maintained that in all the fly-killing contests the total number of flies killed in any one year never exceeded the number which easily could have been bred in a small pile of stable manure or like refuse in a few weeks.

DUMPING CITY REFUSE IN SUBURBAN LOTS

One way to rid a town of a nuisance is to drive the nuisance out to find a home in another town. One way of ridding your back yard of refuse and rubbish would be to throw it over into the yard of some one else. That's what the two enterprising people shown in the picture are doing. The legend on the wagon shows the outfit to belong to a certain Third avenue (New York) "contractor." His contract in this instance was to clean up the accumulated filth from some back yard. He is carrying out his part of the deal by hauling the debris to the back yard of a suburban section, within gunshot of a thickly populated residence district. The load consists mostly of fine manure, together with rotting vegetable matter of various kinds. In a recent laboratory examination of city stable manure it was found that it averaged more than 15,000 fly eggs and maggots per pound, or approximately 30,000,000 per ton. As the fly comes to maturity in twelve days there would be about fifteen broods during the fly season, or a total possibility of 450,000,000 flies for every ton of exposed and untreated stable manure. Decomposing vegetable and animal matter furnished an even more kindly incubator for the pest. No clean-up of fly-breeding material is complete unless the refuse is either burned, put under ground or treated with some of the several cheap chemicals to render it proof against fly-egg incubation.

Those most vigorously engaged in the local anti-fly crusades thruout the country in recent years soon learned how utterly futile it was merely to swat the fly. Altho it worked out well enough in the annihilation of some millions of individual flies, it was sadly lacking as an effectual means of extermination. The anti-fly crusaders early discovered that to accomplish this end meant the oblit-

eration of all material in which flies breed. And since this is foul, germ-laden, disease-incubating filth, its complete removal or destruction means a reform in sanitation; better sanitation means improved health.

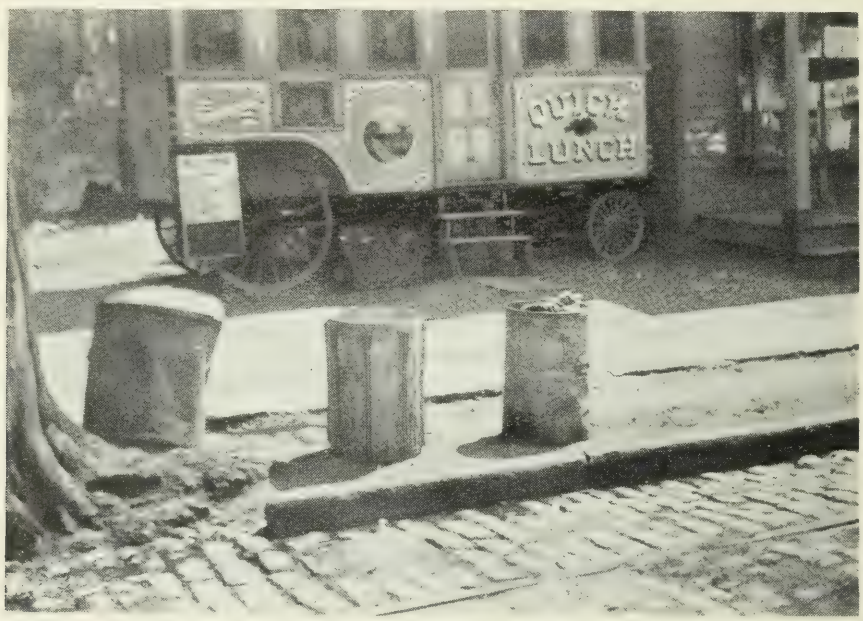
It was at this point, by the way, that the fly provided proof in himself that he was really created for a purpose. And that purpose is only now being understood. Instead of being the evil we have in recent years been taught to consider him, he is an agent for good. He is a danger signal. The very presence of flies indicates unsanitary conditions. Fly-spread disease is a just punishment for not heeding the fly's warning.

ICE CREAM IS MADE NEXT DOOR TO THIS STABLE

Both on the same floor—and *without a partition* between the two. At 468 1-2, on a New York City street, the man and boy are standing at the open door of a horse stable. At 468, before which stands the truck, ice cream is made in a room connecting with and not partitioned from the horse stable. The millions of flies which breed and feed in the manure and filth of this stable can go from their dinner among the excreta in the stable direct into the ice cream plant for a tasty dessert; incidentally carrying with them to deposit on cream and utensils all manner of unspeakable filth and dangerous disease germs, which later find their way into delicious ice cream sodas, sundaes, etc.

To return to the swatting. The accredited world's champion, Master Earl C. Bousquet, the twelve-year-old lad who in 1911 won the first prize in the Worcester (Mass.) contest by catching a total of three bushels of flies, numbering 1,220,000 specimens, turned in a full quarter of a bushel of flies in the evening of the last day of the contest. The local fly-fighting committee was later informed that some of the children engaged in fly swatting had resorted to methods not strictly fair; also, that it might be well to investigate the means employed in fly collection by the "champion." What they discovered gave their staid New England consciences a decided shock.

They found that their champion had not been swatting flies at all according to Hoyle. On the contrary, this inventive youngster had been cheerfully breeding flies for the competition. He had actually established a private fly farm of his own. The crop was audaciously disposed of in lump consignments to the unsuspecting contest committee. He had located his fly farm on an out-of-the-way public dump of considerable extent. Over its area he distributed large quantities of decaying fish and offal, together with much vegetable refuse from the markets. His object was not only to attract swarms of flies to his farm, but also to provide an ideal breeding place, as well as to furnish suitable material for feeding the maturing broods.



The Worcester campaign extended from June 22 to July 12, ample time in which to secure two full broods of flies, the last possibly a hundred times greater than the first. With ready-made window screens he constructed house-like cages over the foul mass to imprison the matured hatches. To harvest his crop was no more difficult than obtaining the $100 prize.

Quite naturally comes the question as

to how many other champion and near-champion fly "swatters" employed the same or similar methods to secure record catches. As a matter of fact, many of the swat-the-fly promoters of the cities found that the liberal cash prizes obscured the legitimate end contemplated. This, of course, was to get the entire community interested in fly extermination. It was found, however, that when a few of the swatters had gained a big lead others became indifferent to the contest and did almost nothing more during the season.

Altho the various campaigns were not so effective as expected nor as presented in press publicity, the general result was to attract public attention to the dangerous character of the housefly, and to promote a definite resolve to plan further and more effectual means for its extermination.

Other ways are better. A Pennsylvanian returning from the Panama Canal makes the interesting statement that he found no mosquitoes there, and that he saw only five flies during his stay in the Canal Zone. And this remarkable condition in an all-the-year-round fly-breeding climate! It should be considered, however, that Dr. Gorgas's anti-fly campaign was not one of swatting. He simply created a condition in the way of sanitation that actually precluded the breeding of flies.

LUNCH WAGON AND GARBAGE CANS IN MT. VERNON, N. Y.

A lunch room and a garbage can, filled with reeking, ill-smelling refuse in various stages of decay, do not offer an appetizing prospective. Particularly is this true where flies are constantly and uninterruptedly passing back and forth between the decomposing vegetable and animal matter in the garbage cans and the food cooking in the kitchen, displayed on shelves or served on the tables. In an examination made at the Storrs (Conn.) Experiment Station, 6,600,000 germs of various kinds were found on a single fly trapped while feeding about a swill barrel. Swill is a greatly diluted germ container as compared with decomposing garbage. It would be interesting to know how many millions of germs were carried by each fly of the thousands feeding about the garbage cans in the picture when they passed from the cans to add a finishing touch to their repast on the viands being served in this Mt. Vernon lunch wagon. Hundreds of barrels of garbage in varying degrees of decomposition were found standing uncovered on the sidewalks of the few streets traversed by the writer in this suburban city. If Mt. Vernon has an ordinance requiring garbage containers to be covered, the citizens are apparently unanimous in their disregard of it.

Another instance of flyless surroundings is that of a small club having a summer resort in an isolated location in the mountains. As it was closed during the winter all the season before, flies were frozen out. There was not a fly on the premises in the spring of 1912. Nor did any appear until a half dozen were carried there on the horses taking up the summer parties. These flies were immediately killed, and during the season all stable manure, sewage, garbage and other refuse was treated with chemicals or burned to prevent fly breeding. The premises were actually flyless for the entire summer. It was demonstrated that where no filth exists there are no flies.

Bearing in mind that flies do not ordinarily travel more than 100 to 500 yards from the place of breeding, except on animals, trains and such carriers,

the club will this year employ automobiles and motor trucks for the transportation of its members and supplies.

And this leads to a statement of the obvious; that the increased use of the automobile will make for a decrease in flies. As horses disappear from a community there will be fewer breeding places for this dangerous plague, and such places can be more easily and effectively dealt with. The removal of animal manure from the stables of cities and farms at least once a week, and the destruction, chemical treatment or like disposal of all other decaying matter in which flies breed, would eventually insure a flyless country.

Of 107,973 officers and men composing ninety-two regiments, records of which were carefully studied by investigators during the Spanish-American War, there were 20,738 cases of typhoid fever, or almost 20 per cent, of which 1,580 died; this being nearly 87 per cent of the total deaths among the men observed. Of the 223,225 men in active service during that time, 2192 died of typhoid fever. In this period there were 285 men killed by the enemy. In most of the cases under observation the infection could be traced directly to the fly as the carrier of the typhoid germ.

When the regulars encamped in the Northwest left for Georgia the Fifteenth Minnesota was detailed to clean up camp. Within twenty-four hours thirty members were stricken with typhoid fever, and fifty during the week. Twenty of these men died. Myriads of flies swarmed in the deserted company streets. They carried particles of the decayed refuse into the mess tent, along with the typhoid germs.

A different story is told in a recent letter from Major J. C. Manley, U. S. A., who was chief surgeon to 4000 troops campaigning in Texas during summer months: "No typhoid fever occurred in this camp; and practical fly-fighting was the one measure to which we attributed this success." A strong statement this, and a condition not impossible to create elsewhere. But Major Manley did not fight flies, as flies. He fought against fly-breeding filth. Having eliminated that, there were no flies to fight. He had proved that it is easier not to have a million flies than to get rid of one.

Applying the last three instances to conditions in the home, it is easy to understand the suggestion that a fly in the dining-room generally precedes the nurse in the sick-room. Also, that a fly in the kitchen may be as fatal as rough-on-rats in the pantry; and that a fly anywhere is an active and efficient solicitor for cemetery lots.

Screening the house against flies is always advisable. In most cases it is absolutely necessary to guard against the pest. But screening and swatting are only remedial measures. To effect a reasonably effective cure of the fly plague, other and more radical methods must be adopted—and continued, with thoroness and persistence thruout the season. And all such methods must be founded in cleanliness; in perfect, practical sanitation.

Swatting is a useless and more or less thankless task; a waste of energy, no matter how well directed. Don't swat the fly! He is an efficient sanitary barometer; a dependable danger signal. Remove the conditions that make his presence possible.

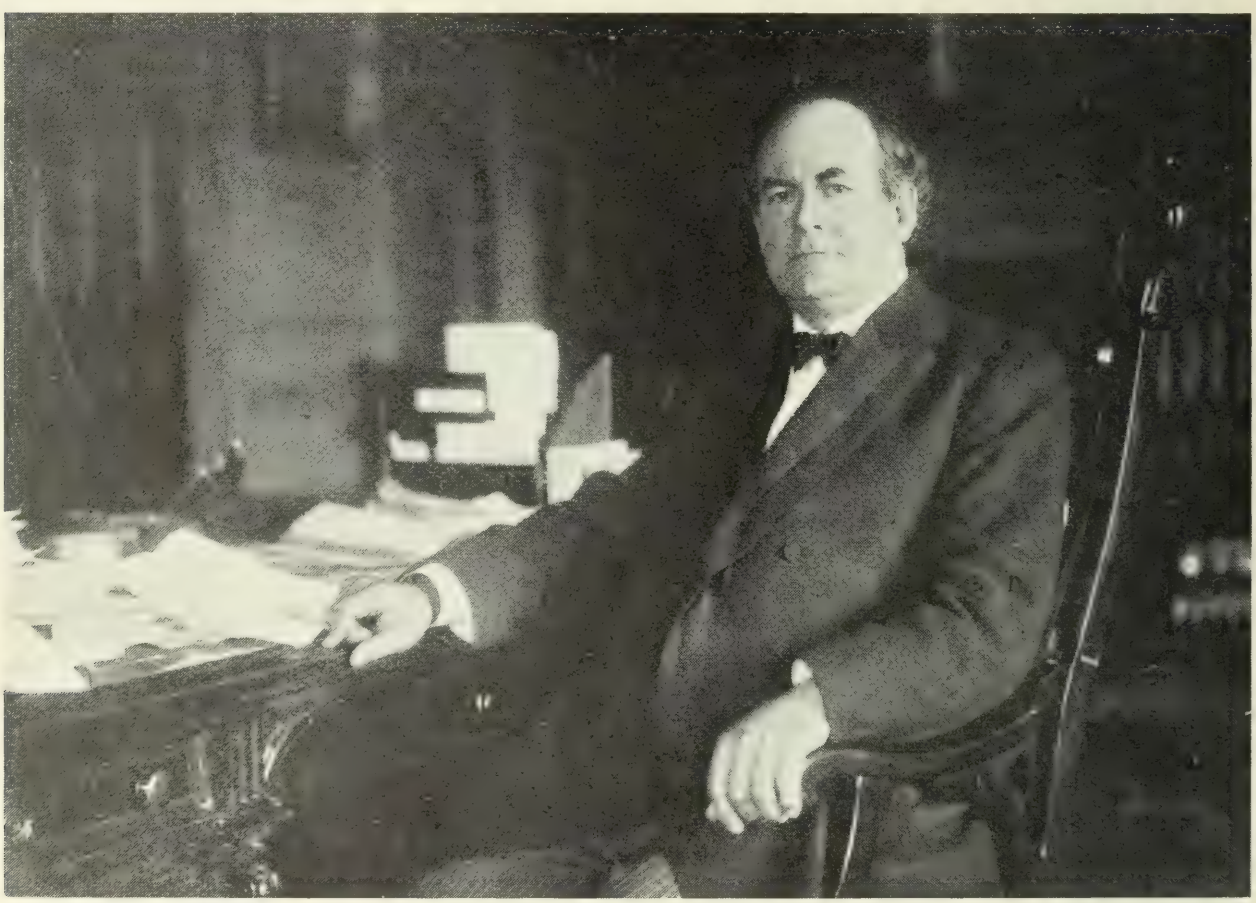
Enact laws and pass ordinances in village, city, county and state, making compulsory the removal, destruction or proper chemical treatment of all waste and refuse in which flies breed or on which they feed. Make the tenant equally responsible with the property owner. Then enforce such regulations. Provide adequate punishment for the offender. Make the first offense a fine at least, together with the costs of the action and the actual expense incurred by the authorities in properly cleaning up and disinfecting his premises, to stand as an assessment against the property. And for the second offense? Put him in jail. Or, better still, on the "chain gang" of the sanitary or clean-up department under the board of health, where he can learn scientific methods of sanitation in a concrete way.

Amend the slogan of 1912. Give it practical purpose. Make it one that will get at the foundation of the fly pest. While one fly is being swatted, millions are breeding in every neglected garbage can, manure heap and filth dump in the land, country and city alike.

Starve the fly!

New York City.

Men We Are Watching



By a Washington Journalist

William Jennings Bryan

SECRETARY OF STATE.

We all know Secretary Bryan. His name has been a household word, his face a fireside companion everywhere, for goodness knows how long; and yet we are watching him today—pretty well all the world is watching him—with a curiosity and an anxiety suggesting that we never heard of him before. Why is it? We all know that he was born in Salem, Ill., some fifty-three years ago, college educated and a graduate of the Union College of Law, Chicago, with a handful of degrees. We know that from 1891-1895 he was a member of Congress. We know that in 1894 he came mighty near being elected United States Senator from Nebraska. We know him as the orator, the writer, the dictator of one of the great political parties, the manipulator of national conventions, the marvelous campaigner, the indefatigable advocate of various propositions, the imperial loser. But—we have not known him as a ruler. We have not known him established in power, holding our national affairs in the hollow of his hand. We have tested his preaching for years, approving or disapproving—it did not matter except for making conversation. But now we have got to test his practising.

Mr. Bryan is the same cordial, democratic, affable man that he was years ago when, a struggling boy lawyer, with trousers too short and sleeves too short and both shining, he made a fiery speech which won for him his first nomination to the House of Representatives. Except that he has grown very bald and increased in weight he has changed precious little with the years—and is good for many more. He gives you the same

Copyright, Clinedinst, Washington

MR. BRYAN AT HIS DESK IN THE STATE DEPARTMENT

firm, friendly handclasp that he gave you when he was a candidate, but there is an almost imperceptible yet potent change in it and him. You feel instinctively that the hand holding yours has also the same firm grip upon the helm of the ship of state; that the eyes, looking smiling into yours, are also fixt upon definite ends which he proposes to attain; that in the soft, low, musical voice there is an undertone repeating "I am Secretary of State," and you know instinctively that while Mr. Bryan occupies that office he will be *the* Secretary of State, with all and everything which the term implies.

In home affairs his policies will be pleasing to some and displeasing to others—anything else would be impossible with such a man as Mr. Bryan. In foreign affairs, upon the great and perhaps the most important question—world peace—his position cannot be doubted or questioned. He is for peace—possibly even to fighting for it. He has not so much faith in the obligations of arbitration treaties as some, but he firmly believes in maintaining peace, and he has a plan in view which will be proposed before long which he believes will improve upon the present efforts toward universal arbitration.

Senator Simmons

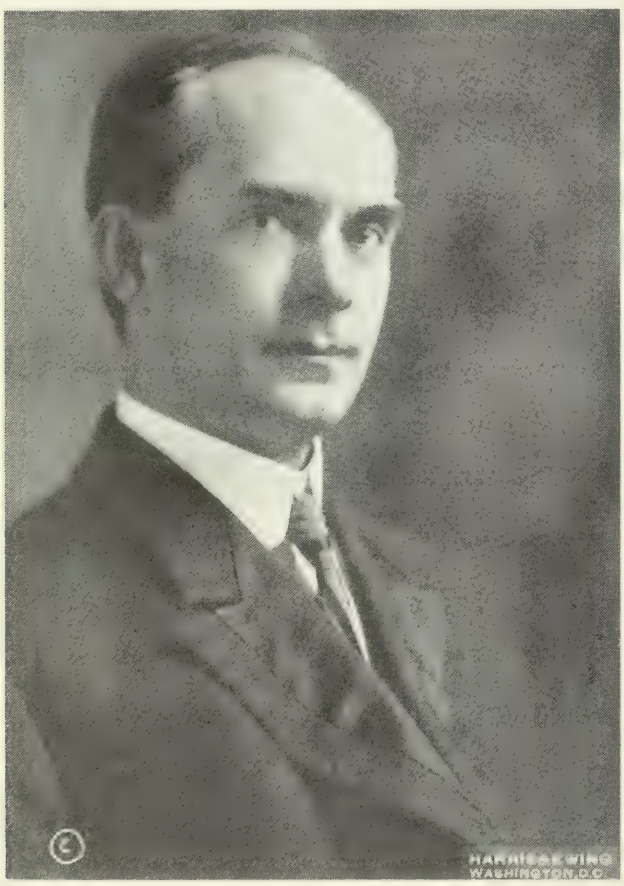
CHAIRMAN OF THE FINANCE COMMITTEE.

We have learned to stand in awe of the powerful Finance Committee of the Senate. Aldrich was chairman of it, and a line of politicians before him who made the wheels go round right merrily. And now Simmons of North Carolina is chairman, and it is within conservative truth to say that since his appointment—hardly two months ago—he has been making wheels go round in a way to startle even some of the hardened engineers of the past. He has the new tariff on his hands—more of a task, this time, than has often fallen to the lot even of the seasoned engineers. Not a few are watching him and wondering if he can accomplish it. So much one may say, at least: that he has a commanding grip on the majority of the Finance Committee, and that he calmly proposes to "expedite" matters, in a way tempting one to confidence that he will do it.

SENATOR F. M. SIMMONS
Chairman of the Senate Finance Committee.

He is a strong advocate of the secret caucus as the place to thrash out party differences, with the final conclusions of the majority binding upon the party. He has won more than one victory along this line already.

Senator Simmons is a small man, but powerfully built, with the accumulated dignity in carriage and demeanor of twelve years in the Senate and two in the House. He has dark hair and mustache, just touched a bit with gray; for according to the calendar he is fifty-eight—tho he does not look an hour past fifty, or even that. He is quiet and deliberate to the limit, except when on his feet on the floor of the Senate. He is as pleasant a man to meet as one finds anywhere. He is a Southern gentleman, completely. All of which tempted some to be surprised when those who knew him best made him chairman of the great Finance Committee. But more and more it will become evident that they knew what they were about. The man who can manage the still hunt well is the man



who manipulates committee and caucus —and eventually the Senate.

North Carolina swears by Senator Simmons—and she knows him well. He is a serious, thoughtful man; not quick in coming to conclusions or expressing them, but with the courage to stand by them when they are reached. In the course of his career in the Senate he has several times taken positions well in advance of the more cautious and timid and defended them to victory. He has well earned the reputation of being progressive and has stood on the firing line in several progressive movements when the man at the front took serious chances if he was not farseeing and self-reliant, as well as fearless. It begins to appear to those most interested that it is a case of the right man in the right place when Simmons appears as chairman of the Senate Finance Committee.

Hon. Robert Lee Henry

MEMBER OF CONGRESS FROM TEXAS.

All over the country you hear of "Bob Henry, of Texas"; outside as well as on the floor of the House interested eyes are fixt on him. He is chairman of the all powerful Committee on Rules, and the "mighty three" who ran the Rules under the Cannon administration came no nearer to knowing how, and doing it, than does "Bob Henry of Texas," tho he has only been at it since the great upheaval. He stands among the foremost of progressive Democrats, and as head of the potent steering committee was directly responsible for the Money Trust investigation, the Shipping Trust investigation, the Steel Trust investigation, and the Sugar Trust investigation, making remedial legislation possible; while by special rules his committee made it possible to secure the passage thru the House of the parcels post bill, the immigration bill, the bill for the publicity of campaign contributions, the anti-cotton-futures bill, the Webb interstate liquor shipment bill, and other measures branded as distinctly "progressive."

ROBERT LEE HENRY, M. C.
Chairman of the House Committee on Rules.

Mr. Henry is a Texan born and bred, valedictorian of his class at the Southwestern University of Texas; a lawyer from the ground up, with the experience of three years as Assistant Attorney-General of the state, and as mayor of Texarkana before coming to Congress. He has served continuously in Congress for seventeen years, and for the last two terms was elected without opposition. He is a little past fifty, but has an almost boyish manner and a frank cordiality indorsed by a low, particularly pleasant voice and smiling face, which are not only disarming, but likely to throw one off his guard who has not noted the firm mouth, the keen eyes and high forehead.

The chairman of the Committee on Rules is a firm friend of Secretary Bryan and has often vigorously defended the secretary's ideas on the floor of the House, where he is a fearless and defiant fighter. The Administration leans on "Bob Henry of Texas" for some important "steering" thru this Sixty-third Congress, and those who know him are convinced that it will not be disappointed.

Socially Mr. Henry is a charming man to meet. He is not one who is consistently looking for trouble. On the contrary, he has many friends wholly outside of party lines who "love the man even while they hate his idols"; and the better one knows him the more easily he understands the fact.

The Newest Frontier

Athabaska Landing—An Outpost of Civilization

By Gardner Richardson

[Mr. Richardson, who writes this article, was until recently assistant publisher of THE INDEPENDENT. He resigned his position in October and spent three months in travelling thru the Canadian Northwest. He is now connected with the banking house of White, Weld & Co., of New York.—EDITOR.]

The Anglo-Saxon race is a race of pioneers. No sooner is a country of possibilities discovered than there is a rush of fortune seekers to the new land of promise. The great rush to California in 1849, to our own West in the last half century and to Alaska in 1898, are examples of this movement to the frontier. The latest, and possibly the last, great frontier to attract the pioneer and settler is the Canadian Northwest.

Until recently the development of this section has been held back on account of the universally accepted theory that it was a land of snow and ice, as unsuited for settlement as similar latitudes in Labrador and Siberia. A fortunate few discovered twenty years ago that this theory was a fallacy, but the world at large has only within the last five years begun to appreciate the unlimited possibilities of this country.

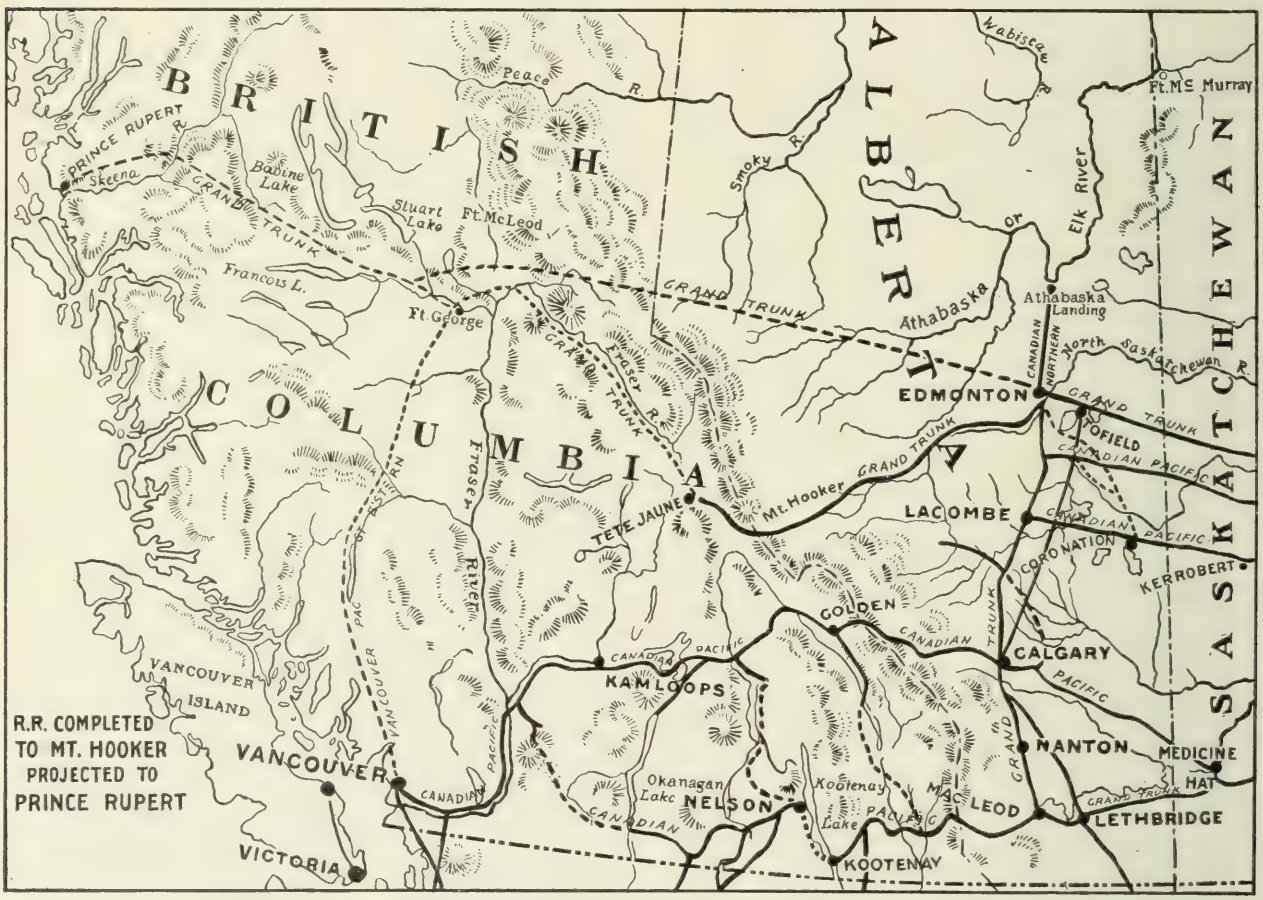
Until the Canadian Pacific Railroad came to Alberta in 1884 this province was an uninhabited region, except for a few trappers and ranchers. When the steel had been laid almost to the foot of the Rockies the engineers decided to locate a town, and placed a box car beside the track on the site of the present city of Calgary. How the box car site grew into a city of 70,000 people in less than thirty years is a development unparalleled in history.

The land around the box car was divided into lots, which were offered to the public at $250 each. A few rash speculators purchased, and when they were able to sell for $500 a few months later they considered themselves fortunate. In the meantime a few stores had been built and Calgary was assuming the appearance of a small frontier town. At first the development was slow, but once started the rate of increase was phenomenal. The following are the official census figures for the population:

1881		0
1891		3,876
1901		4,392
1911		43,704
1913	(estimated)	70,000

The fortunes made in real estate have been enormous. As an example, one of the original $250 lots near the box car sold recently for $250,000. This lot, however, had passed thru fifty or more different hands and many persons had shared in the profits. A few of the early settlers, who had the wisdom and ability to hold their property, have in recent years been able to sell at figures that rendered them independently wealthy.

It was my good fortune to visit Calgary in November, 1912, but unfortunately I arrived twenty-eight years after the railroad. The city was like many in the United States, with paved streets, electric lights and trolley cars. To the north, however, was a country only recently opened. The city of Edmonton, 200 miles northward, is in about the same stage of development today that Calgary was five years ago. And to the northward still is the town of Athabaska Landing, the farthest point to which the railroad has been pushed.



Instead of following twenty-eight years behind the railroad, as at Calgary, I was only four months behind it at Athabaska Landing, for the railroad arrived in August and I in December. A glance at the accompanying map will show the location of Athabaska Landing. It is in approximately latitude 55 north. A similar latitude on the Atlantic coast would run thru bleak and uninhabited Labrador. And here lies the secret of the whole difference between eastern and western Canada. The warm streams of the Pacific Ocean warm the coast of British Columbia as effectually as the Gulf Stream does England and Norway.

It is only 400 miles across the mountains from the Pacific Coast to the plains of Alberta. On the coast is an atmosphere of rain and warm fogs. The Pacific winds blowing across this area are tempered and on reaching Alberta distinctly raise the temperature.

This warm wind is known as the "Chinook" and is a welcome visitor. In a few hours the temperature will rise 40 degrees as a result of this wind, and zero weather will change to a thaw. The result is that there is very little snow in Alberta. The climate is surprisingly dry and the infrequent snowfalls are soon removed by a Chinook.

In going north from Calgary another surprise is in store. Instead of the climate getting colder, it remains about the same. The altitude is less and the coast range of mountains is narrower. There are, it is true, cold snaps in which the temperature drops to 30 degrees below zero, but these never last long and the atmosphere at such times is always so still and dry that the cold is not so noticeable as in New York or other seaboard cities.

It was with the feeling that I was going to the borders of civilization that I boarded the train of the Canadian Northern one morning last December, to start from Edmonton to Athabaska Landing. The distance is about 100 miles and a service of three trains a week is maintained. On account of the frequent stops and the poor condition of the roadbed the journey takes nine hours. My fellow passengers were a varied assortment, most of them making the journey for the first time. A Hudson's Bay Company trapper, returning to a northern post after a visit to Edmonton, was eagerly consulted about local conditions by a family of settlers from Montana. A sergeant of the Northwest mounted police was giving advice to a party of prospectors who were planning to go down the Athabaska River to Fort McMurray. On the train were families to be met at Athabaska Landing by wagons and conveyed to distant home-

THE RUSH-LINE OF SETTLEMENT IN CANADA

Thirty years ago Alberta was almost uninhabited. Now it has a population of 375,000. The railroad has been pushed north to Edmonton and Athabaska Landing, and the rush to Fort McMurray (in the upper right hand corner of the map) has begun.

steads, young men planning to start stores in any place where trade warranted it, and two enterprising Englishmen with a moving picture outfit, which they later installed in Athabaska Landing with great success.

Every one seemed to have caught the spirit of the frontier and was as eager to tell his own plans as he was to hear his neighbor's. With such good company the journey seemed short, altho we started before daybreak and arrived after dark. In Athabaska Landing during December the sun rises after 9 o'clock and sets at about 3, so that the hours of daylight are short. As we stepped from the train into the chilly night air we saw the lights shining from frost-encrusted windows and realized that we had reached the northern outpost of civilization. The hotel at Athabaska Landing is a very good one. It was built before the railroad arrived, and all the building materials and furniture had to be brought from Edmonton by wagon.

And the following morning a hundred interesting sights presented themselves. In the street in front of the hotel a dog sled was ready to start for the north with the mail. During the four winter months, one mail a month is sent down the frozen surface of the Athabaska River to Fort McMurray, and from there via Fort Smith and Fort Simpson to Herschell's Island, on the Arctic Ocean, 2000 miles distant. For the eight summer months this northernmost post of all is without communication from the outside world.

The streets were full of trappers, Indians and half-breeds. More people wear mocassins than shoes in Athabaska Landing. The two large trading stores of the Hudson's Bay Company and Revillion Brothers were doing a lively business with homesteaders, who had come into town to make their winter purchases. During the summer the homesteaders are too busy and the roads are in too poor a condition to allow them to make the journey to town, so the winter season is the time for their annual purchasing expeditions. The Hudson's Bay Company ship annually over $2,000,000 worth of goods out of Athabaska Landing.

This growing town is the gateway to a great country lying to the north. For centuries this northern region has been regarded as a frozen waste, as useless to man as Greenland. Now, however, the

FREIGHTERS LOADING AT ATHABASKA LANDING

This booming Alberta town is "farthest north" on the Canadian Northern Railroad, and is the distributing point for the rapidly developing country still farther north.

agricultural possibilities are appreciated and its great mineral wealth is beginning to be realized. In 1901 the population of Alberta was 73,022, and in 1911 it was 374,663, an increase of 413 per cent. The tide of immigration grows stronger every year, and from present indications the exodus of settlers from the United States and Europe to Alberta in 1913 will break all previous records.

To the farmer of limited capital the taking out of a homestead in Alberta undoubtedly offers the greatest opportunity to be found anywhere today. Under the Canadian laws, 160 acres may be secured by living on the land three years for six months a year. Certain improvements have to be made in the way of breaking ground and fencing the area, but the duties are not arduous. In addition to the head of the family, all members over twenty-one are also entitled to 160 acres, and 160 more may be secured by each person by "pre-emption," which involves certain improvements and a small cash payment. A normal family can secure 640 acres, or a full section, and at the end of three years sell for $20 an acre, or $12,800. Under favorable conditions the land can be sold for a far greater price.

There are many instances of large fortunes made by homesteaders. One man acquired title some ten years ago, to 160 acres about two miles from Medicine Hat, at that time an unimportant railroad station. Since the great industrial development there the town increased rapidly in size, until his original homestead was taken into the city limits. He sold for $600 an acre—$96,600.

An even more startling instance is the famous case of Father Lacombe, who came to the vicinity of Calgary before the railroad and started a mission among the Indians. When the railroad gangs arrived it was only thru his good offices that the Indians were induced to allow the work to proceed in peace. As soon as the homestead laws were passed Father Lacombe took possession of 160 acres immediately adjoining the small town of Calgary, and gradually the town grew up around his reservation. He turned the land over to the church, which at different times has sold portions at a considerable profit. There still remains a park of 80 acres, and this furnishes the only available area for the Canadian Northern to build a terminal upon. It is understood that $500,000 has been offered by the railroad for this property, which could have been had thirty years ago almost for the asking.

The day of such great opportunities has passed, but any energetic farmer can make $5,000 in three years by taking out a homestead, and with a small amount of capital he can make much more. While I was in Athabaska Landing I met two young graduates of the University of Pennsylvania who had taken out homesteads nearby. Both had trained themselves for professions, one for law and the other for architecture. They found their progress slow and little prospect of making more than a living at home, so they moved to Alberta and under homestead rights and by purchase have acquired control to 1000 acres of land. They are confident that by giving up five years of their lives to living on their homesteads they can return to their homes and work thereafter for the pleasure of their work and not for the remuneration.

Another young lawyer I met has opened an office in Athabaska Landing and also has a homestead some six miles away. He plans to live on his homestead six months a year and practise law in his office for six months. He as well is convinced that in five years, or at the most ten, he can retire with a modest competence.

The original attractions to settlers in Alberta were the agricultural possibilities. The long hours of sunshine in the summer and the remarkable fertility of the soil produced crops unusual both in quantity and quality. Since the first settling of the country other resources have been discovered quite as important. Japan today faces a crisis on account of its lack of natural resources to bring wealth to the country. In Japan there are no mines and no great stretches of country suitable for cattle ranges. In Canada the great mining wealth has scarcely been touched. The value of mineral production has increased from $10,221,255 in 1886 to $106,823,633 in 1910. Vast deposits of coal have been discovered in British Columbia and

Alberta, gold, silver and copper have been found thruout the Dominion, and one of the largest asbestos deposits in the world was accidentally struck in making a railroad cutting.

The progress of development in the United States was westward, but in Alberta it is northward. Calgary, Edmonton and Athabaska Landing have been the successive steps. And already there is a whisper of a more northern point still, called Fort McMurray, that offers wealth to the pioneer. This point is located 200 miles north of Athabaska Landing, on the Athabaska River. There is little more there now than a Hudson's Bay trading store and a Catholic mission, but great deposits of asphalt and tar have been found in the vicinity, and the spring will see a great rush of new settlers. When the question arises as to this being too far north for habitation, it is pointed out that wheat has been successfully grown at Fort Smith, 200 miles further north, in latitude 60 degrees, and that the temperature in summer often exceeds 90 degrees.

From Athabaska Landing the Hudson's Bay Company operates a fine fleet of steamers that ply up and down the river. Some of these boats were drawn up on the bank when I was there in December, and the river frozen five feet thick with ice. But in summer the river is a beautiful as well as valuable trade route, and those who have taken the trip down the river claim that it is an experience never to be forgotten.

We occasionally meet persons who lament that the days of opportunity enjoyed by our grandfathers have gone by, but it took far more courage for them to go to California in 1849 as it would for us to go to Alberta in 1913. The land of opportunity always lies waiting for those who wish to take advantage of it.

New York City.

Japan and America

By H. T. Sudduth

O Island Empire, fronting Eastern Seas,
  Where Morning opes her pearly gates sublime!
  Land of the Rising Sun in Orient clime,
And people cradled in dim mysteries
Of ages past, who never bowed their knees
  To tyrant or to foe in early prime
  And in our later and historic time
Flung back a mighty foe who sought to seize
Their neighboring shores! To thee, O brave Japan,
  O land and people of the Morning Sky,
  The nations of the world pay honor high
As worthy of the Brotherhood of Man!
  Salute thy banner and thy people free
  And Island Empire of the inviolate sea.

But now, O sad and shameful wrong and fate!
  In Freedom's own fair clime and chosen land,
  Her fairest, sun-crowned state on Western strand
Has raised 'gainst thee a barrier, closed her gate,
Obedient to the demagogs who prate
  Of Freedom, while with selfish iron hand
  They bar out those who learned from us to stand
For Freedom's cause and build their modern state
Secure, O land to which a Perry came
  To open thy fair realm to progress new—
That fostering land that sent a Burlingame
  To guide the awakening East in ways that grew
To greatness, now, along the Western Sea,
A barrier builds that shames fair Liberty!

Brooklyn, N. Y.

Teaching the Deaf to Speak

By Fred L. Holmes

The heroism of deaf children striving to obtain an education strikes an answering chord in the human heart.

Blind and deaf Helen Keller has a sympathetic world reading all she writes and marveling at her accomplishments. She is bereft of two senses—sight and hearing. Thru the indomitable will of her teachers this prodigy has attained a better university education than is achieved by most persons with all their faculties. She has strengthened mankind in the belief that the afflicted can be made happy and be productive and helpful to society if proper educational methods are employed. The deaf are without the sense of hearing, by which the normal child is taught speech thru imitation. Most of the deaf have perfect organs of speech present, only awaiting development. No magic is necessary. It requires only a skilful utilization of the senses of sight and touch to remedy the defect.

The deaf are now taught to speak, and thru this accomplishment, so long thought impossible, they are able to hold places in vocational life hitherto considered beyond their attainment. With the teaching of the deaf to speak has come another no less remarkable development, that of lip reading.

A half century ago no one in the United States conceived that by reading lips a deaf person might converse with a normal one on topics of the day. Yet today this is a commonplace reality. So expert do some become that they are able to understand to some extent the conversation carried on by the characters in moving pictures; they talk, sing songs, play games, dance, and rank with high averages in classes where hearing pupils are more numerous. A century from today the use of the sign language to teach the deaf will be as obsolete as is the hour glass now for reckoning time.

Phenomenal has been the development of oral schools for the deaf. In nearly all European countries, including Germany, Holland, Norway and France, the gestural signs and manual alphabet have long been discarded for the oral method. In the United States, the stronghold of manualism, 22 per cent of the deaf are now orally taught.

In 1867, just fifty years after Thomas H. Gallaudet established in the United States the first sign language school for the deaf at Hartford, Conn., two small oral schools were started—one at Northampton, Mass., and the other in New York. New educational ideas are like a contagion. Once a germ is planted it infects broad areas. The Pennsylvania Institution, at Philadelphia, the largest deaf school in the world, has gradually changed from a manual to a purely oral school. Of 145 deaf schools in the United States in 1910, 82 use the oral method. Yet, in an attendance of 12,332, only 2808 have purely oral instruction, despite the success of the newer method.

About thirty years ago Dr. Alexander Graham Bell, telephone inventor, appeared before the Wisconsin Legislature to urge the adoption of the oral day school system of educating the deaf. He was opposed to the common policy of segregating the deaf in institutions and teaching them a language different from the people. He wanted the deaf educated in local schools surrounded by home environment. No broad trial had been given the idea. But Bell's life with his deaf wife had given him a vision. The sign language method appeared narrow and unsatisfactory to him. He saw the possibility of educating the deaf orally perhaps more clearly than any other educator of the time. Miss Daisy M. Way, a deaf girl orally educated, now in the employ of one of the largest banking and trust companies in the Southwest, also appeared for the innovation and interviewed the legislators. Her presence was an incontrovertible argument in favor of the benefits of the system. Governor Rusk, later Secretary of Agriculture in President Harrison's Cabinet, became interested. The Legislature hesitated, but finally risked an annual aid of $100 for each pupil enrolled in a local oral school for a year. Since then the State has increased the subsidy to $150;

granted an additional $100 to sustain poor non-resident district pupils attending these schools; made the education of the deaf compulsory, and added a deaf school inspector to the staff of the State Superintendent of Public Instruction. Compared with the cost of institutional instruction the State has saved money by adopting the local day school system. Because Wisconsin employs the purely oral method in its twenty-three local deaf schools the results are indicative.

Says A. J. Winnie, inspector for the day schools for the deaf in Wisconsin:

> People are accustomed to refer to the deaf as "deaf and dumb" or as "deaf mutes," considering those people as being afflicted with a double infirmity. The deaf are dumb or speechless merely because of their inability to hear and consequently are unable to imitate speech until taught to do so. The organs of speech are present and in most instances as perfect as those in a hearing person. Even those who are congenitally deaf are now taught to use their organs of speech. They are learning to speak intelligibly, tho perhaps they do not use as agreeable tones and inflections as those who are able to hear. At the time that the child is taught to speak a word he is also taught to read it from the lips of his teacher and to write it upon the blackboard. Pupils thus taught in time become expert lip readers.

The oral deaf schools are a part of the Wisconsin public school system. The deaf are taught by special teachers in the same building with hearing pupils. They romp and play with the hearing children. They grow up under normal conditions. There is no gestural language to drive them into isolation, and the timidity peculiar to the deaf under such a condition quickly vanishes.

In a pamphlet issued by Mr. Robert C. Spencer, a veteran Milwaukee educator, he says:

> The Wisconsin system of public day schools for the deaf is founded upon the broad principle and policy of public schools for hearing children. They conserve family ties and home life and utilize the invaluable advantages and influences of freer association in the hearing community upon which the development of speech, ability and character depend.

Work in the upper grades is almost identical with that afforded in the ordinary city school, except for a special study of speech and speech reading. Upon reaching the high school, deaf pupils are generally able to pursue their studies with the hearing pupils without the aid of a special instructor.

In Wisconsin there is a practical side to the education of the deaf—manual training for the boys and domestic science for the girls. The extent of this instruction varies with the size of the school and the aims of the pupils attending. In the Milwaukee day school a manual training teacher has charge of all construction work and wood work with the boys. The girls in the seventh and eighth grades attend the regular classes in domestic science with hearing girls and boys; in the fifth and sixth grades they attend the classes with seventh and eighth grade hearing boys.

In a number of the schools the older pupils are partially self supporting. Some of the girls make and sell baskets, fancy work and other hand work, while the boys sell papers, do janitor work and other odd jobs.

Few men possess a memory as reten-

TEACHING A NEW WORD TO A DEAF BOY AT THE MADISON ORAL DEAF SCHOOL

tive or an intuition as keen as that of Thomas P. Gore, the blind United States Senator from Oklahoma. Nature seems to compensate the afflicted with a higher development of their remaining faculties. The whispers in a distant part of a room, which we cannot hear, are intelligible conversations to the orally educated deaf, and the sense of touch is more impressionable than that of hearing people. They seem to read one's ideas by a glance. Recently I received a letter from Lester Brophy, of Oregon, Wis., a graduate of the Madison Oral Deaf School, a boy who has been deaf all his life. He is an expert lip reader. He finds a four year high school course "not so hard as I expected. I have twenty periods a week. I understand my work."

BEGINNING THE ORAL METHOD IN THE KINDERGARTEN OF THE MILWAUKEE SCHOOL

Writes Emil F. Stern, a seventeen-year-old deaf boy of Milwaukee:

> By means of my eyes, I can "hear" so well that I can keep many people ignorant of my deafness. This is even true with several of my teachers at the South Division High School, who had to be told of my handicap before they found it out.
>
> I am able to do this by very carefully watching every movement of a person's lips and forming the words just as the reader does by letters and syllables. Thus my eyes make up to a great extent what my ears lack.
>
> Often I can *hear* better than the "normal" person. I can understand what one says or even whispers at another end of a room; can pick up conversations, tho not perfectly, in any part of a street car, and can often see people swear to themselves in public.
>
> Looking ahead, my future life is not dismal and gloomy, as I feel I am well fitted to take up higher education or to go out into the world. I wonder if I could do this had I learned the sign and finger language! Would I be able to cope with other normal students at any university? With the expert lip reading that the school for the deaf has equipt me with, I have completed the South Division High School with an average of 89, and can do the same at the university.

Here is a record of educational achievement in one school. Of thirty-one graduates of the Milwaukee oral deaf school, twenty-three attended higher schools of learning; ten went to high school, five graduating; two to the State University; five to different colleges; nine to business and trade schools.

Nor are data lacking as to vocations. The report of the La Crosse school shows one pupil "after finishing his course at the institution for the deaf went to Gallaudet College, the only college for the deaf in the world, and later took up work at the University of Wisconsin. He is now head of the agricultural department

of the Mississippi Institution for the Deaf. Two of the girls who went to Delavan are now teaching there. A brother of one of these girls is a cabinet maker in Milwaukee. Another pupil is a successful carpenter in Sioux Falls, S. D., and another drives a United States mail wagon in La Crosse. Another is a prosperous farmer near Westby, while another works in the La Crosse laundry. Two of the former pupils have died. Several have married and others are assisting with the housework in their own homes. They do beautiful needlework and china painting." This school is typical.

From these Wisconsin schools have come boys who have become mechanics, carpenters, cabinet makers, draftsmen, pattern makers, jewelers, upholsterers, designers, printers, farmers, teachers, tailors, cigarmakers—all honorable vocations in which to earn a livelihood. The girls have become accomplished dressmakers, milliners and good housekeepers. Are these not practical results?

Stript of all sentimentality, there is still a practical side to this problem. The most ignorant of mankind living in the jungles of Africa communicates with his fellow being, not by signs, but by speech. The vocations of human existence are common to all. Together must the deaf and the hearing spend their lives. Oral deaf schools have made both the fortunate and the afflicted akin. The pall of loneliness and isolation, incident in the past to the loss of hearing, vanishes with social contact. Thinking, acting, talking and doing as a hearing person, the deaf become a part of the social fabric.

Even Dr. Bell has lived to see his early prophecy vindicated.

Madison, Wis.

Attracting Intelligent Farmers

By G. F. Nourse

One time I went about among New England farms with a soil-expert from the Department of Agriculture—a very accomplished gentleman, who knows all about the composition of all kinds of soil, and how they happen to be what they are. He did not know as much about men as soils, and therefore he bumped against absurd experiences. We were looking over a big, successful farm, with the big and successful farmer. But the farmer was a bit reticent with the expert, while the expert literally poured his erudition and advice into the passive farmer's ears. We traveled some four miles to a sheep pasture, never, it may be remarked, leaving the land belonging to the farmer; passing thru fields, pastures and much woodland. The expert began to talk about the value of lime on such land. He talked lime all the way to the sheep, and finally burst forth:

"Now, Jones, what are you going to do? I have told you all about what lime will do for this land. What are you going to do about it? Are you going to use lime, or not? I sometimes think it does no good to tell farmers how to improve their land. They are so skeptical or so indifferent. You have a great opportunity here. What are you going to do?"

Jones was smoking a stogie. He removed it from his mouth, looked quizzically at the expert, and calmly remarked: "I've got ten carloads on the way!"

Afterward Jones confided to me that "them experts knew a lot, but they think we farmers don't know anything." He made no other comment, but later he said that the men who wished to help the farmers did not know how to get at them. "That expert, now," said Jones, "will never in the world get farmers to consider what he says, because he does not know how to get at them."

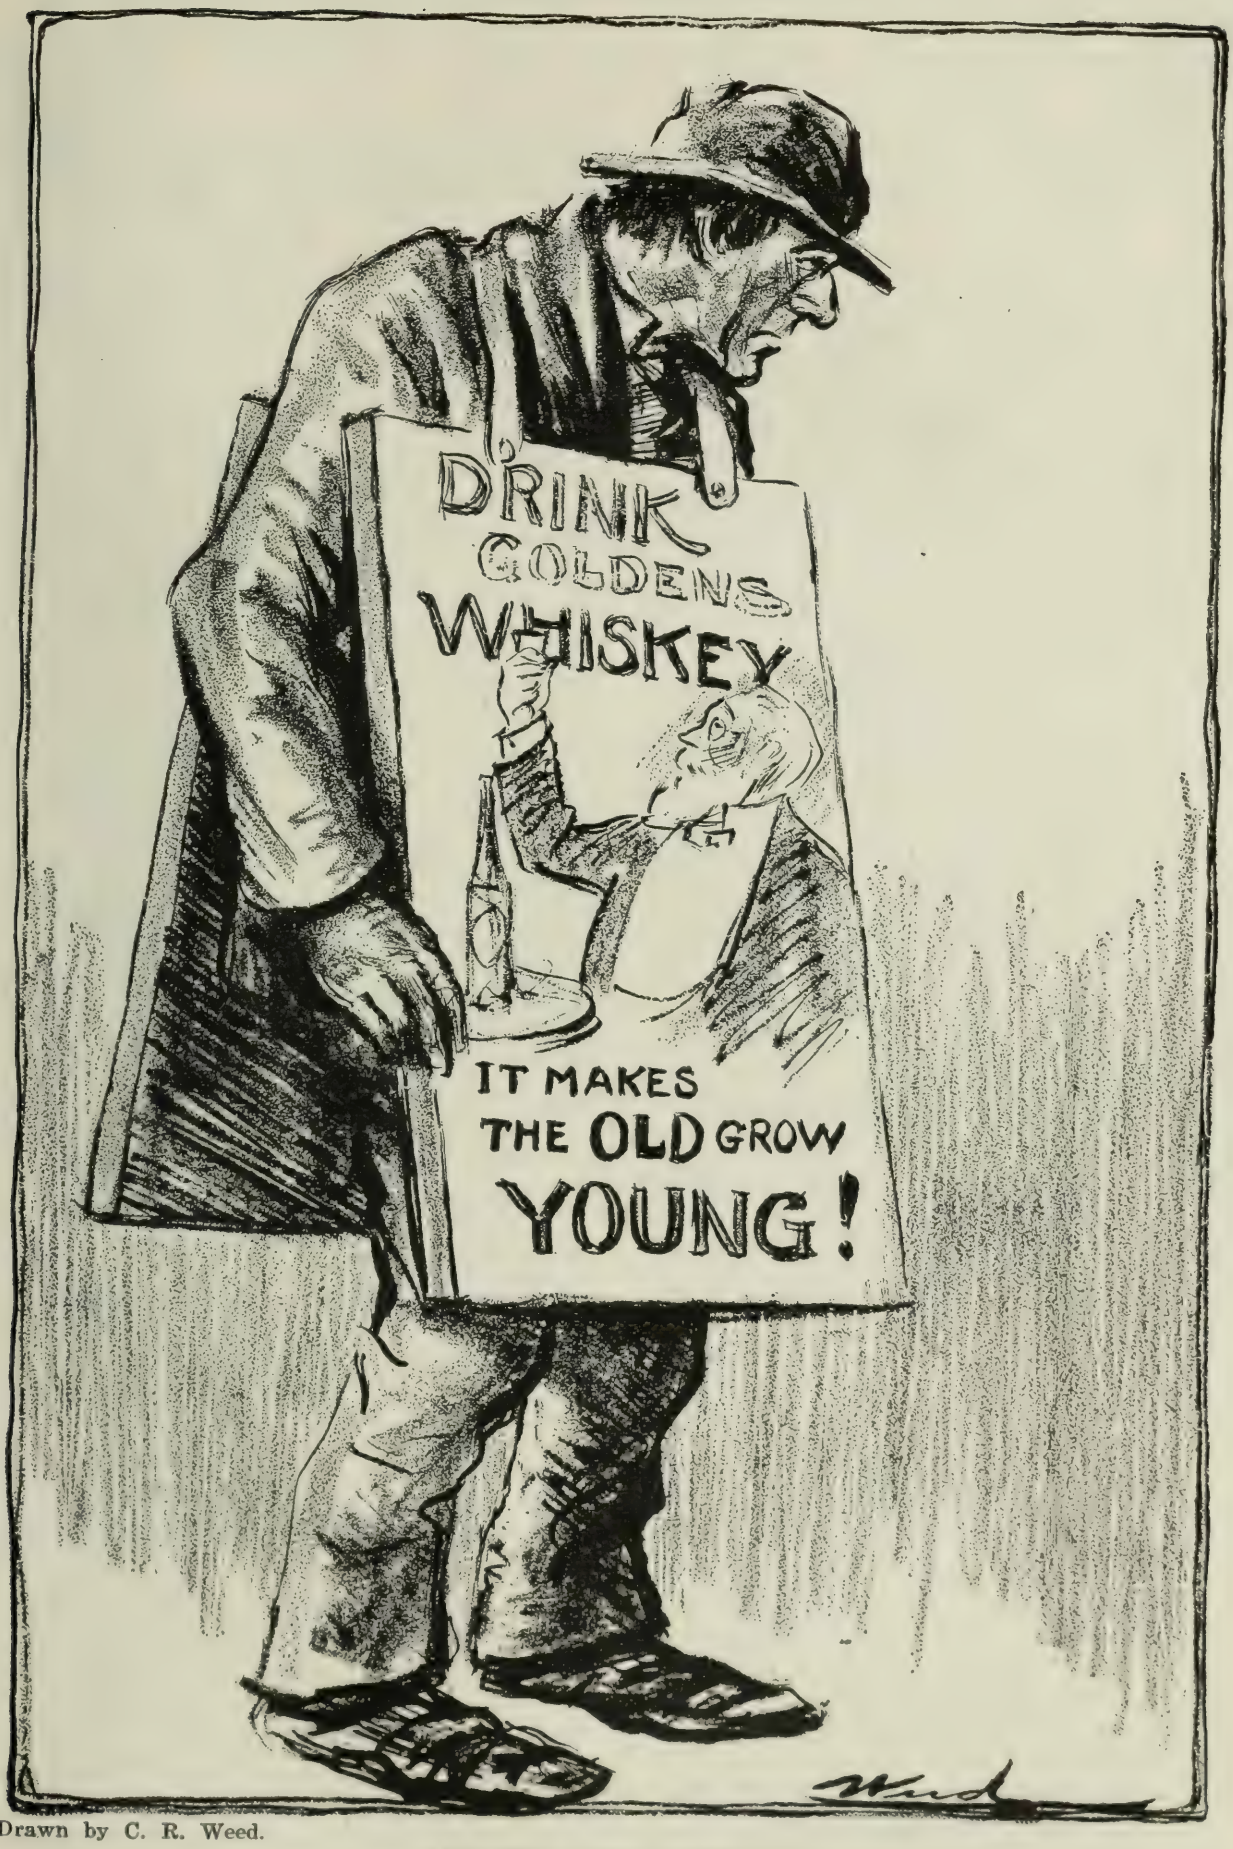
I believe it is somewhat so with the authors who are writing books about rural and farmer life. They simply do not know the farmers. The average farmer is a very good judge of other men. He deals with primary relations of life. He gets his impressions from Nature and is suspicious of men who assume to know too much.

So it seems to me that while Prof.

John M. Gillette declares in the preface to his book on *Constructive Rural Sociology* (Sturgis & Walton Company, New York, $1.60) that it was written "with the desire to reach the intelligent farmer as well as the teacher and student," he has missed all chance to reach the farmer because he does not manifest that interest in the farmer that comes of knowledge. There have been many similar books issued during the past two or three years, and I do not recall one that would appeal to Jones.

One of the professors in an agricultural college went out to a farm that was proving a failure, took a handful of the earth in his hand, let it run slowly thru his fingers, looked about to note the formation of the land, and told the farmer to pull up his peach trees and plant onions. The peach trees had cost quite a lot of money, and had got just to the age when they should bear profitable crops, but did not. It took courage to pull them up, but the professor explained, and up they came. The next year the farmer sold to one commission man $1600 worth of onions, and he had not had the courage to plant more than a quarter of his peach orchard to the pungent bulbs.

Farmers have got to be shown, and shown in a sympathetic and brotherly spirit.



Professor Gillette labors in his thick book to specify everything necessary for the construction of a model community, even to its socialization, but omits the essential thing—brotherhood, the essence of the whole matter. He says that his "interest in rural matters was first aroused by" a course in "rural communities" at Chicago University. The average intelligent farmer will not be likely to get beyond that declaration.

The farmer is really a social being. He is primal, and does not like or understand the conventional attitude toward him assumed by those who are trying to show that they know what he should do and how he should act. The experts of the Government are beginning to see this—some of them. Their methods are being modified from year to year. They are getting close to the problem of the farmer, and begin to see that the land problem, and the rural problem, is the problem of the men on the land.

I am reminded of a little experience with a typical Vermont farmer, who was also "road surveyor" for his town. I came across him while he and his horses and men were eating their noonday lunch, 'way up among the Green Mountains. The whole outfit looked upon me and my companion with distrust, and were not inclined to converse. A few words about their team, the road machine, and their good work down the road, opened the tobacco-stained mouth of the grizzled old giant, and he filled our ears with a constant flow of talk. He was a truly sociable being. He said so himself.

"Once I had a feller on the machine, handling the for'ard lever, who wouldn't talk. 'Darn ye,' thought I, 'I'll make ye open your mouth!' We were coming to a big stun in the road, that none on us had been able to git out. I touched up the leaders, and the team jumped into a smart trot. I hollered to the dumb-head to b'ar down on his lever. He couldn't see the rock. Wall, sir! we struck that stun, the scraper flew up in the air, the lever rose too, and that dumbed feller landed about ten foot ahead o' the leaders! Wall, perhaps he didn't swear at me! 'Durn ye,' says I, 'open yer mouth once in a while. Ye can, I see. Now talk some, as we all do, or, by hookey, the next time I'll land ye clean over into Birch Holler!' "

The old man pointed Birch Holler out to us, laughed long and loud, and all the men in the gang laughed, at the memory or the yarn. Then we talked a little about the crops, the old man's farm, his children, and so forth, and he seemed interested in what we told him of new ideas about land. What would he think of the extremely sophisticated textbook Professor Gillette hopes may interest intelligent farmers? The problem of the land, and of the farmers, if there is one, is a human problem, and not a classroom problem. Men like Professor Gillette, who are obsessed with an idea that they should undertake the regulation of rural life, after having heard a series of university lectures, should spend some time studying the problem as it is.

Drawn by C. R. Weed.

—AND THE *YOUNG* GROW OLD

THE NEW BOOKS

Three Books on Browning*

The centenary year of Robert Browning was marked by an enormous flood of literature about the poet's life and work. New editions of his poetry appeared, the magazines were choked with essays (*peccavi*) and well-bound books of appreciation and of criticism adorned the windows of the middlemen. Miss Helen Clarke, of Boston, who has written much on her favorite poet and prophet, and who, with Miss Charlotte Porter, has produced the only annotated edition of the complete poems, appears once more in the role of interpreter in the large volume before us, which is an attempt to show that Browning was in harmony with the spirit of his age, not as a follower, but as a leader. She makes out a good case, especially in the chapters, "The Battle of Mind and Spirit" and "Social Ideals." She shows that Browning, the most spiritual poet of the century, was never antagonistic to the advance of scientific thought, but eagerly welcomed every new discovery and the taking of every fresh outpost. Her book is the result of many years of hard study and original thinking, but will be interesting reading only for those who are already firm in the faith, already familiar with the work of the great poet, and in hearty sympathy with his aims and ideals. It would never do as an introduction to the study of Browning, nor will it convert the Philistines; partly because it protests too much, but mainly because it suffers from heaviness of style. We do not ask for flippancy or Chestertonian paradox; all we desire is a little salt. I think that Miss Clarke is mistaken in assuming that Browning did not accept for himself the Christian religion; if one reads the poem "Christmas Eve," and then reads the letters that passed between Miss Barrett and her lover in 1846, one cannot escape the conclusion that this particular work was not "dramatic," but was the expression of personal conviction. The present reviewer was the first to point this out in THE INDEPENDENT some years ago. Miss Clarke's book will be welcomed by serious students, and the numerous portraits add both to the beauty and the value of the volume.

Dr. Moxom has for many years been a devoted admirer of Browning, has taught his poetry to many classes in Springfield for a long time, and has given inspiring lectures in public on this theme. Every page of his little book, dealing with the great prophet of optimism and the great pessimistic novelist, has its charm, and is written with a simplicity and lucidity that are sure to please. In fact, this modest and unpretentious volume in blue is just the thing to put into the hands of those who wish to begin the study of Browning and to discover the chief elements in his poetry and in his view of the world. The essay reads like a personal talk, and its value lies precisely in the fact that it is intimate and confessional. We see just why the poet appeals to a man of Dr. Moxom's range of experience, solid culture and good sense.

Mr. Foster's book is damned by its title. It is time that the hackneyed, canting word "message" should be tabooed. People do not always need what they want; and those who want a "message" really need not a message, but a stiff mental massage; they will not find it in this rhapsodical, slushy work. The wise will, of course, avoid the book as soon as they see the title thereof; and those, like the present reviewer, who are compelled by duty to read every word of it, will lose all patience. It is a pity to condemn

**Browning and His Century.* By Helen A. Clarke. Garden City, N. Y.: Doubleday, Page & Co. $1.50.
Two Masters—Browning and Turgenief. By Philip S. Moxom. Boston: Sherman, French & Co. $1.
The Message of Robert Browning. By A. Austin Foster. New York: George H. Doran Co. $1.25.

so uncompromisingly a beautifully printed volume that doubtless gave its author much pleasure and that is marked thruout by so much reverence for the things that are unseen and eternal; but it is just such books that make the skilful laugh and the judicious grieve or swear, according to their temperament. It has plenty of gush, but no cerebration.

WILLIAM LYON PHELPS.

Palmerston and Democracy

In following up his work on the Bourbon Restoration by the history of European complications during the Orleanist monarchy, Major John Hall has performed a task which few men were better able to fulfil (*England and the Orleans Monarchy.* New York: E. P. Dutton & Co. $4.) His long residence in France, while attached to the British Embassy, has given him the Continental point of view, yet at the same time he stands detached from partisanship or national prepossession. His sympathies are more with Palmerston than with any other of the many actors on the stage of European politics, but even as regards part played by the English in all the intricate diplomatic negotiations of the years from 1830 to 1848, his long absence from his native country has given him an outlook much less insular than that, for example, of Mr. Spencer Walpole. Major Hall's work resembles in many respects the fitting together of an intricate puzzle, of which the parts are found in state papers, diplomatic correspondence, political memoirs, dispatches and letters. Only by collating all these materials and making the one part fit in with others derived from quite different sources, can a true estimate be arrived at of the causes and motives lying behind the bare facts of history. Major Hall's clear, incisive intellect has been able to combine all these fragmentary and frequently prejudiced and one-sided bits of information into a complete whole. His style is simple and direct, almost to baldness.

The importance that Major Hall attached to Palmerston's part in the game of European politics may be gaged by the fact that there are some two hundred and fifty entries under Palmerston's name in the index. In other words, Palmerston's name appears on considerably more than half the pages in the volume. Louis Philippe has to be content with much less attention; there are long sections where the Orleanist monarchy seems quite in the background. Still Major Hall is right in giving France its place on his title page. The whole history of Europe would have been changed had it not been for the lucky combination of a Liberal Foreign Secretary in England and a constitutional monarchy in France. It was impossible for the French monarchy to side with the absolutist powers of Europe while it depended upon the popular vote, and the foiling of the Holy Alliance and the schemes of Austria and Russia for making the sovereigns of Europe practically a government trust, united in an alliance against the liberties of the peoples which they governed, was due to the combined influence of England and France from 1830 to 1858.

Another fact of value brought out incidentally by Major Hall is that, in foreign politics as in home politics, democracy is the only safe course. Lord Palmerston was keen-sighted enough to see that as soon as a nation attained to any degree of real self-government, foreign politics could no longer be carried on purely according to the will of the reigning monarch. "Foreign influence," he wrote, "can best be exerted over the court of a despotic monarch, and becomes much weaker if not entirely paralyzed, when it has to act upon the constitutional representatives of a free people."

Careless Chesterton

The dangers of hasty generalization and of an excessive fondness for antithesis are well illustrated by a remark which Gilbert K. Chesterton makes in his introduction to a new edition of *Æsop's Fables* (Doubleday, $1.50). "But the fable and the fairy tale are things utterly distinct," he says. "There are many elements of difference; but the plainest is plain enough. There can be no good fable with human beings in it. There can be no good fairy tale without them."

Alas, careless and forgetful Mr. Chesterton! You had only to turn the leaves of the book you were to preface with the profundity of your wisdom, in order to save yourself from this egregious blunder in which any child could have set you right! And is it possible you have forgotten from your own childhood the fable of The Man and the Satyr, that of The Viper and the File, and so many others which prove conclusively that your plainest of plain criteria for distinguishing fables from fairy tales is really no touchstone at all? As for the second part of your statement, perhaps you did not know that our American poet, Joseph Rodman Drake, once wrote a poem on a wager to show that there could be a fairy tale without a human being in it—

for your error is an old one, a veritable Baconian "idol of the marketplace," and can, no doubt, be traced back at least to that other ready generalizer, Coleridge, who was capable of coming to such a conclusion on the sole evidence of *A Midsummer Night's Dream*. And even if you are not familiar with *The Culprit Fay* you must know the lovely fairy poem by Shakespeare's own contemporary, Michael Drayton—the *Nymphidia*, which is equally innocent of human intrusion upon its diminutive world. Either your education has been seriously neglected, Mr. Chesterton, or you have grown strangely forgetful in these elder years!

The South Americans

Mr. C. E. Akers' *History of South America, 1854-1904* is the best general history of the continent (Dutton, $6). The volume is a careful and fair-minded effort to set forth past history and present conditions. The author's task was one of unusual difficulty. He had to deal with ten different nations, to sift out and consider an immense amount of material, to weigh the significance of numerous political and personal movements, of religious and racial forces, and to view justly the national characteristics of the various peoples. And he has accomplished his task with surprising success. Mr. Akers' judgments are free from prejudice, and his analyses of the very diverse temperaments and individualities of the South American states are careful and discriminating, and have their sound basis in his trustworthy story of South American history. Here is a typical estimate: "Argentine national character bears the impress of Spanish traditions, and the conservative tendency apparent in the Spanish Peninsula still militates against the rapid evolution of civilization in these newer countries. The provincial inhabitants cling to the customs of their forefathers with persistent disregard of the benefits of more advanced ideas. In the Argentine, as in the Spaniard, there is a dislike of close attention to detail in public and private life. Hospitality is a characteristic trait in all classes of Argentine society, alike in city and country, and rich and poor never fail to offer to the chance guest the best that their home contains. In the more isolated districts the people are simple and superstitious to an unusual degree. Quick to resent real or fancied injury, the Argentine is prone to be equally impulsive in forgetting any cause of dispute. No better example of these characteristics could be found than the facts in connection with the many outbreaks of civil war and revolutionary disturbances, and the comparatively small amount of bad blood these conflicts have left behind."

And here is a just estimate of the religious influence of the church in Colombia: "The opportunity offered to the priesthood to educate and civilize is of a most wide description, but little taken advantage of; for, as in many other South American countries, the priesthood is often recruited from the lower strata of the community, and the men have neither tradition nor ambitious desire to spur them on to the work of regeneration so urgently required. Foreign priests from Spain and Italy, of whom there are many in Colombia, make no determined effort either to bring about any strong reaction against the low moral standard everywhere apparent."

Mr. Akers' book is a history, and not like Mr. Bryce's *South America: Observations and Impressions*, a book of philosophic travel and political discussions; and it may well be read in preparation for Mr. Bryce's volume as well as in succession to it. Where so vast a field has had to be covered opinions must needs be exprest with which others will take issue. The future of tropical South America may not be so readily conceded to the Chinese and the sensitive Latin peoples will shrink from some of the plain spoken historical judgments of their history. But it can be heartily commended as such a thoro and yet succinct historical summary as Americans should read for a background for their present-day interest in our neighboring continent.

Sir Clements Markham writes in his smaller volume of *The Conquest of New Grenada* and of the consequent destruction of the ancient Chibcha civilization which occupied in the present republic of Colombia the place filled in Peru and Bolivia by the civilization of the Incas. The field of research touched in Sir Clements' book has been but inadequately explored and it may be doubted whether we shall ever attain a satisfactory knowledge regarding either the Incas or the Chibchas, much less the Mayas. (Dutton, $2.)

The Olympian

The Olympian, by James Oppenheim (Harper, $1.35) is the most recent variation on what is probably the oldest theme since Joseph rose from his obscurity to be chief financier of Europe. It is the story of the boy from the country who comes to the city to try his fortune. Modern literature gives the reader a choice of two endings: the young man becomes horrified at the evil, the callousness, the money-worship of the city, and saves his soul by going

back to "the old farm," or "the small town" —or (and this is the more recent and popular theme) he takes the city by the throat, defies it to do its utmost, forces from it its secret, and becomes suddenly or gradually (depending upon whether the author is Robert W. Chambers or Theodore Dreiser) a "force," a "person" and a "power."

Mr. Oppenheim has taken the second variation for the story of his book, but, by the time he is thru telling it, he has delivered not so much a piece of colorful fiction as a sharp and impressive criticism. Kirby Trask, of Trent, Ia., is the Olympian who storms and conquers the city after a series of setbacks and defeats—and it is these very defeats that reveal Mr. Oppenheim at his best. He shows, at his keenest, the same warmth and sympathy that distinguished such earlier works as *Dr. Rast* and *Wild Oats*, and his style has improved immeasurably. He still seems to find it difficult to check his rhapsodic tendencies, but his rhapsodies are always those of a poet. His descriptions of a boy's first night in the "sleeper," the brilliant illumination of Broadway, the motor ride in early spring are memorable. As a novelist Mr. Oppenheim still lacks (and quite intentionally) calm reserve, aloofness, the impersonal tone —but his novels can never fail to stir the reader so long as he brings to them the gay and confident philosophy, the fierce faith and the keen poetry of every day.

The Negro and Others

Dr. Booker T. Washington, having made a seven weeks' journey over unbeaten paths in Europe, studies "the new, the unfinished, the problematical" types of an older civilization. He names his volume *The Man Farthest Down*, and his publishers are Messrs. Doubleday, Page & Co. ($1.50). The book is a timely warning to those negroes who are tempted to despair of their lot in this country and to dream of relief elsewhere.

Mr. Edward Eggleston is a Virginian who in *The Ultimate Solution of the Negro Problem* (Boston: Badger, $1.50) begins with the introduction of life on the earth and attempts to prove scientifically the inherent inferiority of the negro, and to show that the true solution is the crowding out of the negro from productive industry and his elimination by disease. The ignorance of the author appears in the fact that he constantly calls Sir Harry H. Johnston by the name of "Johnson," and that he tells us that the cephalic index means the "cranial cubic capacity."

Benjamin G. Brawley is professor of English in Atlanta Baptist College for Negroes. He writes *A Short History of the American Negro* (Macmillan, $1.25). The facts given are carefully collected and may be accepted. One will notice, as usual in such histories, that too much is made of the influence of Garrison and his associates as compared with that of the leaders of the Liberty and Free Soil parties. Yet an immense number of facts have been registered in most compact form, making the volume valuable for reference.

The Seamy Side

Miss Elizabeth Robins seems deliberately to have dispensed with much of her art in order to make her novel, *My Little Sister*, strong and gripping (Dodd, Mead & Co., $1.25). Her sacrifice has been partly in vain, for what the book loses in art is not altogether made up in force. The early part of the book in which two sisters dwell in cloistered seclusion with a nervous mother is delightful and delicate, tho incidents, some of them disconnected, unexplained and illogical, are forcibly introduced as a prelude to what is to follow. That much we must complain of with regret; there are too many loose ends which the ending does not knit together. When the girls leave for London, we touch melodrama lacking in those touches of conviction which might have made this novel greater than it is. It is not that the happenings in the house of ill-fame—the worst in Europe—are improbable. They are not—they happen every day in the week, but to us Miss Robins does not make them wholly convincing. It is a question whether this indictment of the white slave traffic should be placed in the hands of young girls or in those of their mothers, but we are sure that its reading will go far to pointing out the lurking dangers of life which are prevalent in villages as well as in great cities.

Protestant Episcopal or Catholic?

The impending discussion in the coming Episcopal General Convention has for weeks been filling the Church papers, and now it overflows in a full volume, *The Proposal to Change the Name of the Protestant Episcopal Church*, by Dr. Randolph H. McKim, of Washington. It is a series of chapters which state clearly and forcibly the argument against the change from "Protestant" to "Catholic," proving conclusively that Protestantism has been for centuries the position of the Church of England and that the Ritualists who demand the change are neo-Catholics who wish to change also the teachings of the Episcopal

Church, as given in the Prayer Book, so as to ally it to the Roman Church and separate it from the other Protestant bodies. Dr. McKim shows that their purpose is divisive and that it threatens schism.

Concerning China

We are glad that the success of the first issue last year of *The China Year Book* warants the appearance of a second volume for 1913, and we doubt not it will appear annually hereafter. It is a thick duodecimo of 703 pages (almost twice as many as the 1912 volume) besides a map in two colors and tables of statistics. The editors, H. T. Bell and H. G. Woodhead, have had long editorial experience in China and have given very full and accurate information under all needed heads pertaining to present China. It will be indispensable not only to bankers, shippers and merchants, but to others interested in current history of the mightiest and youngest of republics. As an illustration we turn to the tables on mission work in China. The statistics, so far as given, show 324,890 Protestant communicants, and 1,363,697 baptized Catholic converts. There are 548 Protestant native pastors, and 701 native Catholic priests. We learn that our Government keeps 1590 officers and soldiers in China as guards to our legation and consulates. Of course the Government of China is much disorganized and awaits the action of the National Assembly this month to create a permanent constitution. (Dutton, $3.50.)

Literary Notes

M. Maurice Bourgeois, a former student of the Sorbonne, in Paris, has written a book on *John Millington Synge and the Irish Theater,* which will be published in the fall by the Messrs. Constable of London.

May Sinclair's latest novel, *The Combined Maze* (Harper, $1.25), is a tale of marriage and divorce: a story which will seem to some readers spoiled by anti-climax, yet all the same as cleverly intuitive as this novelist's earlier work.

The traveler not averse to leaving the beaten track will find attractive suggestions in Arthur Stanley Riggs's *Vistas in Sicily,* a generously illustrated and appreciative account of an Englishman's ramblings. (New York: McBride, Nast & Co., $1.10.)

The Harvard University Press announces as among its books in preparation *Essays on Chaucer* by Prof. George Lyman Kittredge, *The Search for Salvation in the Greek and Roman World* by Prof. C. H. Moore, and *A Bibliography of Municipal Government* by Prof. W. B. Munro.

Stewart Dick has in *Master Painters* (Small, Maynard, $1.25) brought together chapters on artist life thruout the centuries and of certain of the old masters of Italy, Nuremberg, Spain, Holland, France and England—tho perhaps England cannot be said to have any old masters. It is an attractive book in form and in content.

The *Dickens Yearbook,* issued by McClurg of Chicago, was compiled by Louis E. Prentiss and Gertrude C. Spalding. It should serve as an incentive to renewed appreciation of an author to whom readers flock even without special invitation. The only fairly successful illustrations are by Dan Sayre Groesbeck. ($1.)

The editors of The Wisdom of the East Series have brought out an attractive little volume in which M. A. Murray retells some of the *Ancient Egyptian Legends* about the gods of the elder days (Dutton, 70 cents). While following closely the stories as recovered from inscriptions and papyri the author presents them in English forms as well as language.

Jerome A. Hart has devoted to *Sardou and the Sardou Plays* a study of almost four hundred pages, including statistical material. (Lippincott, $2.50.) There are analyses of the many plays which this able technician turned off during so many years and a certain proportion of anecdotes and appreciation besides many photographs and notes of certain American playbills.

Two books about famous women are Alice Kemp-Welch's *Of Six Medieval Women* (Macmillan, $2.75), and Mary Ridpath-Mann's *Royal Women* (Chicago: McClurg, $1.25). The former volume has for its heroines a tenth-century nun whose avocation was playwriting, a *grande dame* of the twelfth century, who wrote rimed romances, a thirteenth-century mystic, a fourteenth-century patroness of art and her kind, a fifteenth-century feminist poet, and Agnes Sorel—who needs no introduction. There is also a note on medieval gardens which, like the other chapters, is richly illustrated from books of hours; so that even if the author had not acquitted herself as handsomely as she has, the book would be well worth owning. The volume *Royal Women* also is illustrated, but tho the pages are interesting in some degree, they are not nearly so well printed, while the women under discussion are much better known to the general world of readers—Queen Elizabeth, Marie Antoinette, the Empress Josephine. No one will quarrel with the author's statement that history and romance go hand in hand, but we cannot see that anything is added here either to history or to romance.

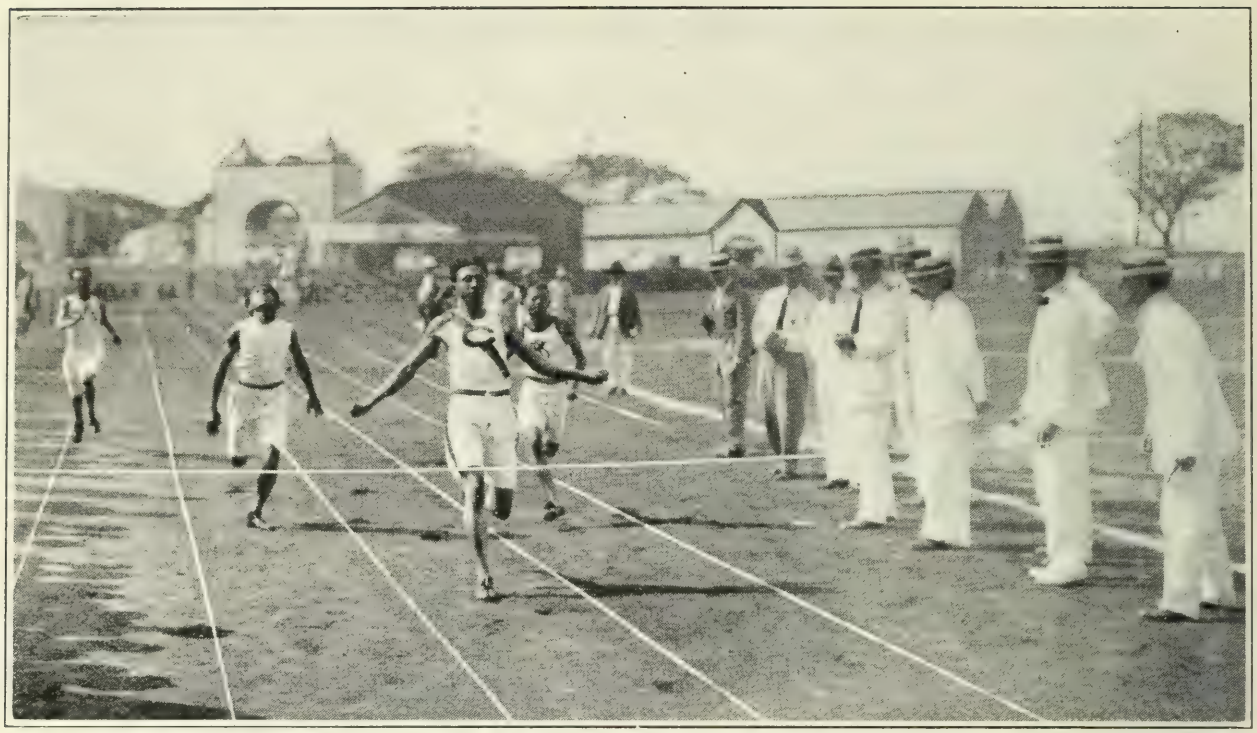
SURVEY of the WORLD

Why France Is Worried

Do the defects of the nation's qualities threaten France's ruin? The qualities in question are thrift and family-love. The ruin threatened, with a remoteness that is all the same calculable, is relative depopulation. France and Germany consider one another natural foes; and unless universal peace passes meanwhile out of the ideal into the actual, there will in due time be two German conscripts armed to the teeth for every one Frenchman in uniform. True, Germany also has a depopulation problem, so far as Berlin and the suburbs of that gay capital go, for there the birth rate is lower than that of all France; but the rural population makes up for this and more. Any one with a head for figures can calculate it for himself. France has 23 births per thousand where Belgium has 28, England and Russia 30 each, the Netherlands 33, Spain and Italy 36 each, and Germany 37. To put it another way, France and the states constituting Emperor William's realm had each a population of about thirty-three millions, sixty years ago; today France has thirty-nine millions and Germany sixty-five. There are 1,800,000 births annually under the German flag, and only half that number on the French side of the Rhine. No wonder Senator Bérenger is urgent in bringing the subject before his fellow lawmakers!

M. Brisson, in his weekly journal, *les Annales,* blames the situation upon "the excess of caution, the taste for economy, which characterize the race." The Frenchman of a little property wishes to insure for his children—or his child—the same social and financial situation, or a better one, than his own. See what that means in an era conscious, above all, of the advancing cost of living! For this is a world-phenomenon, and is not least conspicuous in a country of public functionaries, like France; where every second individual craves the distinction of holding a government post.

M. Brisson reproduces some conversations which would be amusing if they were not tragical in their monstrosity. Even in country districts the doctrine of Malthus is coming to be generally adopted. Thus a peasant woman who had but one son, aged fifteen, gave birth to a second boy. General consternation. To the elder the mother urged: "You won't lay it up against me, I hope?" And the youngster: "No, mother, I forgive you!"—For it is the same with the peasant proprietor and his offspring as with the bourgeois. The rural father dreads to see his fat fields divided—partly because he loves his son, partly, alas! because he loves his fields themselves.



It is those without property who multiply with least reserve—in France as elsewhere. M. Bertillon has studied the various *arrondissements* of Paris; in the aristocratic Champs-Elysée he finds 34 births for each 1000 married women, and 109 for each 1000 at Grenelle—one of the suburbs tenanted by working folk.

The remedy? It should concern us Americans, too. M. Brisson, for his part, mentions proposed legislation tending to lighten the taxation of good-sized families, and increasing the burden of childless households and couples with only one or two children. Even the confiscation of the estates of such persons, on their death, is suggested. But natural inclination and deep-rooted national traits are not easily dealt with. Will the state in the end establish eugenic farms?

The Highest Balloon Ascent

Since about the beginning of the present century meteorologists have prosecuted an active campaign of investigation in the upper atmosphere with the aid of kites and balloons especially constructed for this purpose. The knowledge thus acquired constitutes the new science of "aerology," which, besides throwing a flood of light upon many scientific questions, has an immediate practical bearing in its application to aeronautics.

The most remarkable piece of apparatus utilized in aerology is the sounding-balloon. The envelope of this balloon is made of India rubber. Inflated to less than its full capacity with hydrogen gas, it is sent aloft carrying with it a set of very light instruments for registering the temperature, pressure and humidity of the air. As it rises the gas-bag expands, under diminishing pressure from without, and finally bursts at an altitude more or less accurately determined in advance. A parachute then

TRAINING THE FILIPINOS IN AMERCAN SPORTS
Finish of the 100-yard dash, 1912 Manila Carnival. A team is to be sent to San Francisco in 1915.

wafts the instruments gently to the ground. In the course of weeks or months the apparatus is usually recovered, often scores of miles from the place of ascent, and its valuable record is deciphered. These balloons are now sent up at frequent intervals from scores of observatories.

Some astonishing altitudes have been attained by sounding-balloons. In November, 1908, an ascent was made from Uccle, Belgium, to 18.0 miles, and this altitude remained the "record" for two years. In September, 1910, a balloon was sent up by the United States Weather Bureau from Huron, S. D., to a hight of 18.9 miles. In June, 1911, another balloon sent up from Uccle reached 20.1 miles. In September, 1912, a hight of 19.1 miles was reached over Batavia—the "record" up to date for a station within the tropics. Finally, on December 7, 1912, the stupendous altitude of 23.4 miles was attained by a balloon sent up from the Geophysical Observatory at Pavia, Italy. This is about three and seven-tenths as high as the greatest altitude ever reached by a human aeronaut.

Needless to say, the conditions prevailing at such a level are strikingly different from those at the earth's surface. The density of the air is less than one-two hundred and fiftieth that which prevails at sea level. The highest clouds are left far below—the maximum altitude of "cirrus" being about ten miles. Moisture is practically *nil*. Lastly, the temperature recorded by the balloon at its greatest altitude was 60 degrees below zero Fahrenheit; but a considerably lower temperature—viz, 76 degrees below zero—was encountered at an altitude of about 20 miles.

Filipino Athletes

About the first thing we bestowed upon the Filipinos after landing in the islands was a fine system of public schools. As soon as the young generation was sufficiently advanced, high schools were established to further their education. Now, all the provincial towns have well-appointed high schools. The natives are not only mastering their studies in English, but they are also taking to American sports. Athletics mean more to the Filipinos, perhaps, than to Americans. They mean a hardy physique as well as fun. Naturally an anemic race, our wards have been driven to sports to save themselves from the white plague, a disease that reaps a frightful harvest in the islands.

Baseball first attracted the fancy of the boys, and they have become so proficient in our national game that they have defeated strong American teams and have beaten the best Japanese teams that have been sent against them. Every high school has its athletic or track team, and some fleet-footed sprinters and marvelous jumpers and vaulters are fast developing. The American teachers stimulate interest by offering prizes—furnished out of their own salaries. The bureau of education regularly contributes handsome cups, and now and

then the governor-general and the commissioners donate individual purses. Without a doubt there are no tropical peoples anywhere who are so enthusiastically taking up open-air sports as our wards in the Far East. Some day they will be the tropical giants of the world.

The native girls, naturally shy and modest, were slow in following their male companions onto the field or into the gynasium, but the American women teachers have led the way for them. The girls are going in for basket ball and play a snappy game.

Not many years ago the government, aided by the business men of the islands, founded an association to hold annual carnivals in Manila, both for amusement and for the promotion of economic interests. This fiesta is a sort of insular exposition and is the big event of the year. Athletics figure prominently in each day's program, and, of course, most of the contestants are Filipinos. They compete against trained Americans and all manner of foreigners sent to participate in the carnival. And not infrequently the natives win a big percentage of the prizes. In fact some star sprinters, jumpers and vaulters are rising from native ranks; perhaps it will not be long before Manila will send contestants to the Olympic games. There is talk of it already.

A crack native athletic team is already in process of organization to compete in the athletic events to be held at the Panama-Pacific Exposition in San Francisco in 1915. This team will be composed of all the best track and field men of the Philippines. On its way to San Francisco it will stop at Shanghai, China, to take part in the Far Eastern Olympiad.

Great rivalry is manifested in all the provinces, and altogether, the Filipinos, boys and girls, are proving great lovers of sport. Apparently they never took the Spaniards' out-door amusements as much to heart as they are taking ours.

Bird-Banding

There has recently been organized in this country The American Bird-Banding Association. It is composed of the foremost members of the American Ornithologist's Union and the leaders of the Audubon movement. Its headquarters are at the American Museum of Natural History in New York City.

The aims of the association are purely scientific. It is proposed to study the habits of birds by means of records made by enthusiastic and trained bird students. Each wild bird banded wears an aluminum ring that slips loosely up and down the tarsus so as to be of no injury or inconvenience to the bird. On every ring is inscribed "Notify American Museum, N. Y.," and a number which corresponds with one on a filing card

PILLOW FIGHT BETWEEN IFUGAOS

The performers, once head-hunters, are amusing the visitors at a field day held by American teachers.

in the museum giving the species of the bird, also the date, place and circumstance of the banding.

It is thus hoped that ultimately sufficient evidence will be obtained to make scientific generalizations on numerous questions of interest to bird students. For instance: To what extent do birds return year after year to the previous nesting place? How far will birds be found nesting from their birthplace? By what routes, in what direction and how far do birds fly in migration? Do birds have definite winter quarters? To what age do birds live?

Last year 800 birds of seventy-three species were banded and already records possessing much interest have been made. But clearly it will be only by extensive banding thru a long period of time that results of permanent value will be obtained.

Here are a few examples of "Return Records" as reported by Howard H. Cleaves, of the association:

"It was on June 7, 1911, that an adult chimney swift fluttered down a chimney into the study of Mr. Ernest Harold Baynes in Meriden, N. H., and was promptly banded and released. The band bore the number 6326. At eight o'clock p. m. on June 15, 1912, two chimney swifts flew from the chimney into the same room. . . . One of them proved to be 6326. Remarkable as it may seem this diminutive creature, less than six inches in length, had travelled hundreds of miles to Central America or elsewhere in the Tropics where he spent the winter and then made the long return journey at the approach of summer and found again the chimney of his choice in a village of far-off New Hampshire.

"A farmer by the name of August Schilling, of Evansville, Ill., was walking across his fields on April 1, 1912, when he frightened a butcher bird from a fence post where it had been feeding on what proved to be a bluebird. On picking up the victim Mr. Schilling was astonished to discover the bird wore a ring on its left leg. He wrote a letter giving the number of the band and asked for information saying, 'Please let me know when the band was put on. There are lots of people who would like to know.' This particular bluebird was one of a brood banded by Dr. R. M. Strong, of the University of Chicago, at West Allis, Wis., on July 5, 1909. The band had been carried for two years and nine months and had apparently caused no inconvenience. It is probable that this bluebird had made two complete migrations to the South and was about to complete the last lap of a third when he was so unfortunate as to cross the path of *Lanius borealis*."

We are sure that any of the readers of THE INDEPENDENT who find banded birds either alive or dead will report where and when they found them to the American Museum and thus lend their aid to a very promising scientific enterprise.

Drinking Water at Meals

The time-honored teaching that much water with meals interfered with digestion has at last been completely discredited. Professor Hawk, while at the University of Illinois, carried out an elaborate series of tests with a number of students in order to learn just how much water should be taken with each meal. By careful chemical analysis of all materials concerned it was found that the body took a higher percentage of nutriment from food when about a quart of water was taken with the meal than by the use of either more or less water. The results were the same with all the students under investigation. So much was their assimilative power increased that their general health made noticeable improvement.

This is logical enough, because any chemist knows that there is a certain dilution of any chemical that produces the greatest activity and that particular dilution has to be found by experiment. Our grandmothers did not take time to experiment—they merely made the didactic statement that water with the food was bad and the world took their word for it. Fortunately we now have the results of authoritative experiment and water is still cheap. One caution is given. The food is chewed and swallowed without being washed down—the drink follows or precedes that operation.

Rock and Rye for the Soil

Every good farmer knows that it is desirable to plow under clover, cowpeas, rye or any forage crop, and considers that the benefit is largely a matter of so much green manure enriching the soil. Some of the more progressive believe that the decay of each stalk of rye leaves a channel permitting better circulation of water. Both theories are right, but only partly right.

Straw contains a small amount of tannic acid which has the power of flocculating the soil, working it into a looser, more porous condition so that it can absorb and hold more water and soil solution. This is called the colloidal condition, and is the very opposite of that observed in sand. Sand is composed of hard, compact grains and has little power to retain moisture. Science is rapidly coming to believe that the physical or mechanical condition of the soil is just

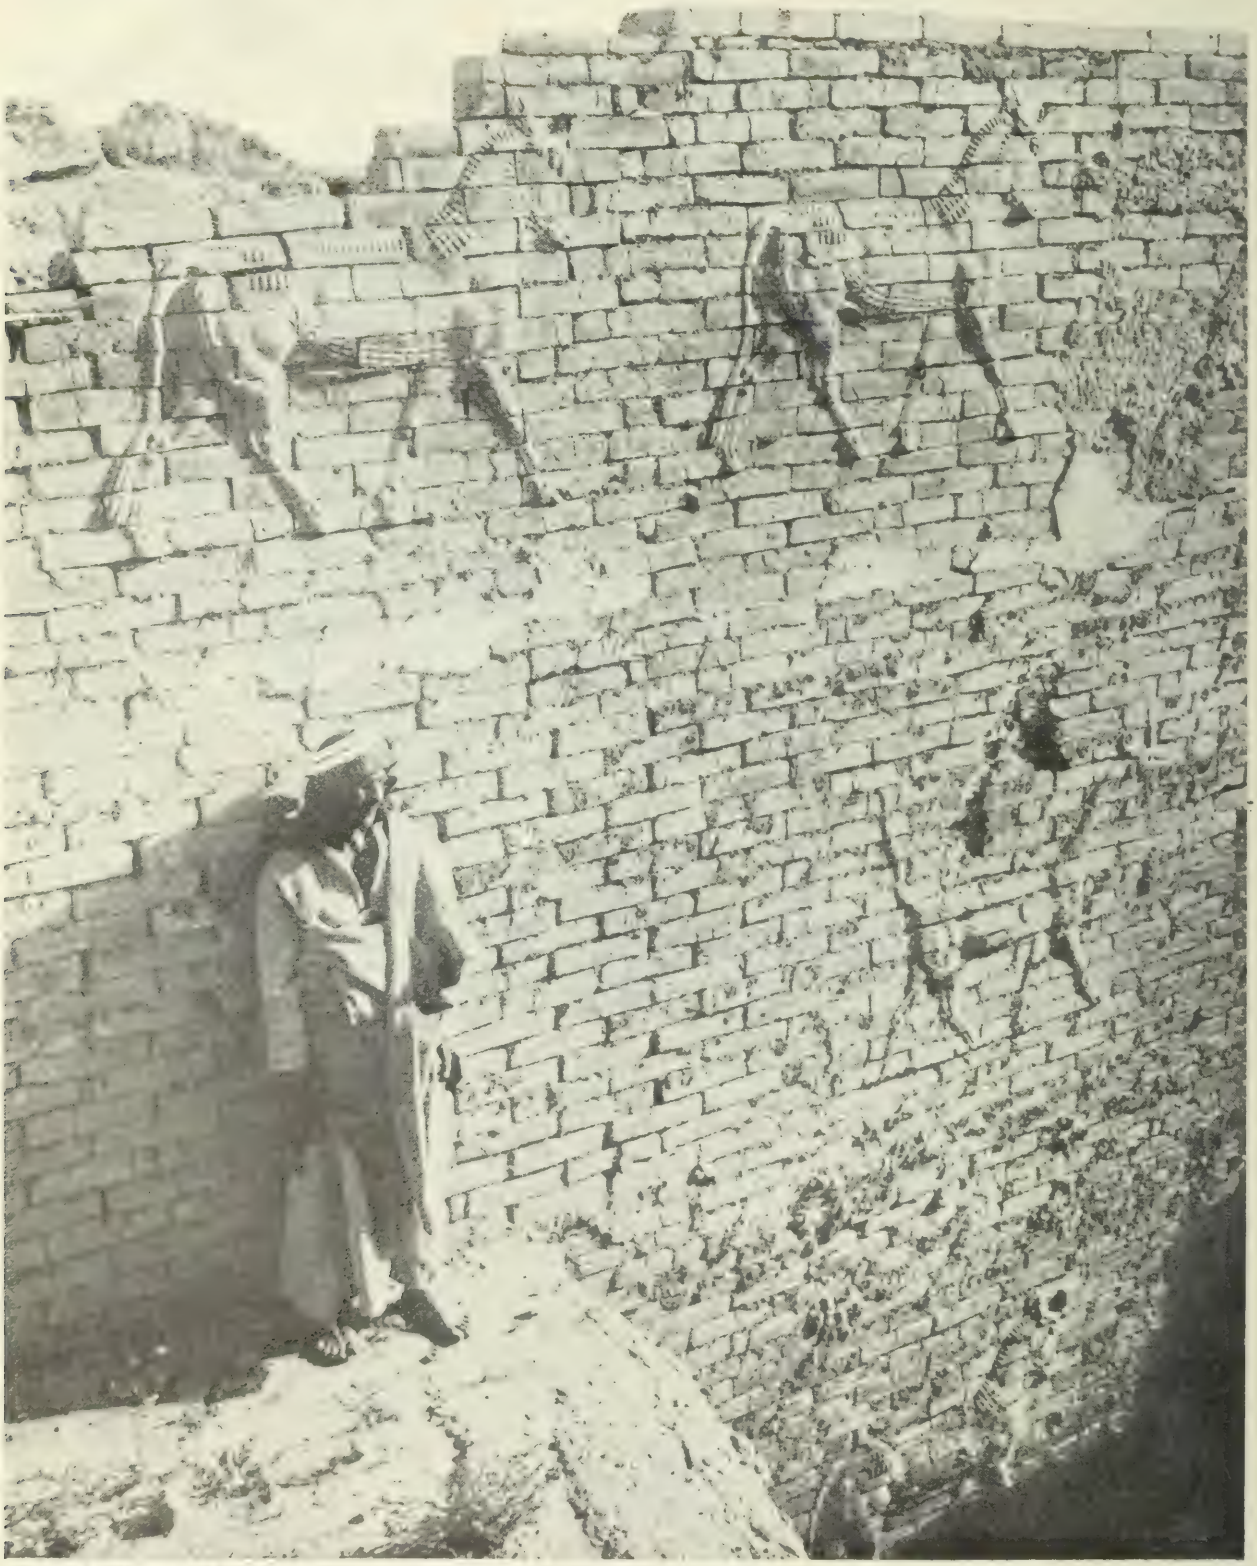
as important as the chemical composition, and so materials like plowed-under stubble or strawy stable manure capable of flocculating the soil into the colloidal form are of the greatest value. The old Bible story of the sufferings of the Israelites compelled by their Egyptian masters to make bricks without straw has a colloidal explanation. The tannic acid of the straw gave the clay the binding qualities of colloids without which the bricks were harder to mould.

the nitrogenous material of the soil and releasing nitrogen, or rather ammonia, into the air. Raw limestone has no such ill effect, and refuses to do anything except destory acids. Rock and rye is good soil medicine.

Excavations in Babylonia

For several years a German expedition under the direction of Dr. Koldewey has been excavating the ruins of Babylon. Their

Copyright, Underwood & Underwood



COFFINS OF THE BATHTUB SHAPE, OF THE PARTHIAN PERIOD, FOUND AT BABYLON BY THE GERMAN EXPEDITION.

So much for the rye and its benefits, but the rock—crushed limestone rock—must go with the dose or a very sour, sick soil may result. If the rye is plowed under green, humic acids in excessive amount develop and no catch of clover or alfalfa can be made. But the farmer may freely plow it under green, merely taking the precaution to sprinkle on a good dose of raw limestone crushed to a powder. As fast as any acidity develops it is immediately neutralized by the limestone. Had burnt lime been used the acid would have been neutralized as expected but the caustic power of burnt lime would go on working, decomposing

enormous mass justifies the boast of Nebuchadnezzar that "This is great Babylon which I have builded." The square circuit of the walls can still be traced, on which it was said that three chariots could ride abreast. There are three principal elevations, one known as Bab-il, or Gate of God, which was an enormous pyramid of stages, usually identified with the Tower of Babel, and so called by George Smith and Dr. Koldewey. Another portion is called Jimjimeh, and yet another Homera.

The German excavations have not been very successful in results other than architectural. The main streets of the city are

exposed, one of these that of the processions in honor of the supreme god Merodach, while the gate of the goddess Ishtar, or Venus, is another notable location. The walls were decorated with enameled bricks on which were figured great bulls and the dragon of the two gods, Merodach and Nebo. This dragon was a composite monster, with the head and neck of a serpent, the body of a leopard, the claws of an eagle, and with a long tail elevated to match his head and long neck. In the figure the bulls are seen above, with a protruding horn, so as to appear like a unicorn, while the dragon is below. This manner of ornamenting walls with enameled bricks having colored designs was a favorite one at this period in the East; and a reproduction of elaborate designs found at Susa, in Persia, may be seen in the Metropolitan Museum.

RELIEFS FOUND AT BABYLON BY THE GERMAN EXCAVATORS

Above are bulls, and below the dragon of Merodach, as figured on enameled bricks.

Mendelized Hens

Never before in the history of biology have purely scientific methods been so widely applied to agriculture as at the present time. With the fundamental laws of heredity which Mendel gave biologists, it has become possible to put experimental breeding of plants and animals upon a thoroly sound foundation. These laws of heredity within the last few years have been applied at the Maine Agricultural Experiment Station in experiments for breeding a strain of chickens for egg-laying ability. The results have proved the efficacy of the Mendelian doctrine.

It was found that high egg production depended upon two factors which it was necessary for a hen to possess, one for normal egg production and the other for excess egg production. If a hen possessed either of these separately she would be an average or a poor egg producer, but when both of these factors were present, other conditions being favorable, her laying qualities would be above the normal. The factor for excess egg production was found to be a sex-limited factor. This is a condition which biologists have found to occur for many characters and has widespread significance in breeding work. Sex has been found to be an inherited quality. In many forms studied it has been shown that certain characters stand in a definite relation toward the factor for sex. This condition is known as sex-linked, since it is not possible for both males and females to transmit a character, which bears this relation to sex, to both their male and female offspring.

In the experiments with the chickens, the factor for excess egg production was found to be borne by the male. He could transmit this factor to either his sons or his daughters. If the daughters had also inherited the factor for normal egg production they would be high egg producers. But the daughters in turn could only transmit this factor for excess egg production to their sons, since the determiner for the female sex and the factor for excess egg production could not enter the same germ cell. Therefore, to obtain and continue a strain of high egg-laying hens it is necessary that not only the mothers should be high egg producers, but that the roosters should be sons of hens possessing this quality.

For a period of ten years previous to these experiments, selection of females had been carried on to produce high egg-laying strains. Birds which were high egg producers were selected to breed from and the best layers among their offspring were used as breeders. But since it was not possible for the mothers to transmit this excess laying quality to their daughters, the offspring did not always make the good records that their mothers did. At the end of ten years the strain had deteriorated for this quality so that the average egg production was below that which it had started with. But by the application of modern breeding methods it has been possible to obtain in a relatively short time the result which the old theories of breeding failed to accomplish.

The Krupp Press Bureau

What is thought to be the best organized of all press bureaus is that maintained by the famous firm of Krupp, at Essen, which has recently had no little unsought publicity. Each week this bureau receives more than a thousand newspapers, and clippings almost without number. This list embraces not only technical papers, but the usual dailies, provincial papers and news sheets from frontier towns and seaports. These are all read, digested, and their information duly classified and filed.

The obscure papers from seaports are given special attention for the reason that they are not so discreet in certain matters as their more important contemporaries. The latter are very careful as to the news they print; but, in the case of an obscure paper, the arrival of new guns in a local fort or the building of new fortifications is treated merely as an item of local interest.

To the Krupps such information is, of course, of far wider interest. From the material thus gathered, with translations from technical papers and careful reproductions of illustrations, the Krupp bureau makes up a monthly paper, circulating only among members of the firm.

That the information collected by this bureau is of the highest value is evidenced by the fact that the Imperial army staff itself is glad to make use of it. A question that arose during the Boxer campaign may be cited as an instance of the perfection of the filing system. It became desirable to ascertain the origin and identity of two Maxim-Nordenfeldt guns mentioned in press despatches as being in the hands of the Chinese. The Krupp files immediately disclosed the fact that these guns had been sent out some years before to China; that they were shown to a viceroy and ordered, but that they had not yet been paid for.

In addition to its press bureau, the Krupps maintain a Berlin daily, the *Neuste Nachrichten*, and a monthly magazine, the *International Review of All the Armies and Navies*, as well as a military and naval almanac.

Pebbles

"He met his end in the electric chair."
"Shocking!"—*Pennsylvania Punch Bowl.*

Cutout (looking back from the driver's seat)—"What happened to Aunt Mary?"
Sparker (winking at the girl)—"Perhaps the carburetor."—*Williams Purple Cow.*

I sat in the dentist's arm-chair.
He asked how it felt to be there.
"I feel bored," I explained,
"I may even say pained,
"For your extracting's distracting, I swear."
—*Cornell Widow.*

He and she arrived in the fifth inning.
He (to a fan)—"What's the score?"
Fan—"Nothing to nothing."
She—"Goody! We haven't missed a thing."—*Illinois Siren.*

She—"You know, my dear Julius——"
He—"Julius? You meant to say Karl, didn't you?"
She—"Oh, how silly of me! I thought this was Wednesday."—*Pennsylvania Punch Bowl.*

He—"Will you be my partner——"
She—"Oh, George, this is so sudden! Give me a little time——"
He (continuing)—"For the next dance?"
She (continuing)—"To catch my breath. I haven't recovered from the last Boston yet."—*California Pelican.*

Recovered Patient—Please tell me just what was done at the hospital, doctor.

Fifty Years Ago

From **The Independent,** May 21, 1863

FOREIGN

—There is news from Mexico in Washington which ought to be trustworthy, brought by our consul, Mr. Ottenberg, who left Mexico April 18, and Vera Cruz May 1. Mr. Ottenberg says that the Juarez Government is quite satisfied with the appearance of its political interests at the capital; that well-informed Americans in that city believe that the French expedition has already received its death-blow; that the French soldiers desert very rapidly, nearly 2000 having run away to the Mexicans within three months; and that sickness is hard at work amongst them.

THE OPPROBRIUM OF STATESMANSHIP

With the exception of the linen trade, which is a small affair in fact, the whole business of the Irish people is the production of corn and cattle, and yet the distress, spread over all sections, is more extensive than that of Lancashire—solely from the scarcity of food. The island is undergoing a constant depletion as to both wealth and population. The value of live stock in 1862 was less than in 1859 by four millions sterling. The land under cultivation was less by 150,000 acres. The yearly value of the crops diminished nearly one-third. The population has diminished by millions within twenty years. The Church of England, which has sucked the wealth of the land for centuries, numbers fewer adherents, and has ever a less percentage of the population within its reach than it had thirty years ago. In a word, if statesmanship consists in the making of a state, it must be confessed that Ireland stands out before history as the opprobrium of Statesmanship.

THE WEEK

Tariff Revision

The Senate, on the 16th, decided that there should be no hearings on the House tariff bill before the committee to which it has now been referred. Senators Penrose and La Follette were leaders of the movement for hearings. The vote was 41 to 36. Two Democrats (the Senators from Louisiana) voted with the Republicans and Mr. Poindexter was counted with the Democrats. Some thought the result pointed to the passage of the bill without any important change. But there are signs that at least two Democrats in addition to those from Louisiana will vote against the House bill's provisions concerning wool and sugar. The committee will report about 300 amendments, but it is understood that they do not affect the distinctive character of the bill.

Not before June 1 will the bill be reported to the Senate, and the date may be a week later. The debate, which will not begin at once, promises to be a very long one. If a currency bill should be passed in the House, consideration of it in the Senate cannot be expected.

Manufacturers and the press have been discussing the remarks of Secretary Redfield and Senator Williams about official investigation of employers who may undertake to reduce wages on account of tariff changes. Mr. Underwood spoke, in the House, week before last, of the action that would be taken by the Secretary's Department. The Secretary has since discussed the question in an address before a meeting of the National Association of Employing Lithographers, taking for his text a circular in which this association said that the proposed changes would compel wage reductions in their industry. Senator Williams went further, saying that it would be practicable to prosecute employers under the Anti-Trust law, if there should be evidence of concerted action.

California and the Japanese

After President Wilson had asked Governor Johnson to veto the land bill or to delay action, it became known that Japan's protest, while claiming that the treaty would be violated, was based mainly upon the assertion that the bill was insulting and offensive, thus affecting Japan's national honor and pride. Mr. Bryan said on the 12th, at a banquet, that there would be no war while he was Secretary of State. On the following day it was said that Japan was waiting for Governor Johnson's action. On the 14th the Governor sent to Mr. Bryan and the President a long statement in explanation of his position.

The substance of this was that the treaty had not been violated, because the words of it had been included in the bill, and its provisions respected; that no offense had been intended; that there was no discrimination; that if discrimination against the Japanese could be found in any statutes, it was to be seen in the Federal naturalization laws; that laws like the California had been enacted in other states, and that Japan herself forbade the acquisition of land by aliens. California's representatives had passed the bill by almost a unanimous vote, and he felt it was his plain duty to sign it, "unless some absolutely controlling necessity demands contrary action."

It was understood in Washington that our Government would support California. An answer to Japan was prepared and was discussed by the Cabinet. At the end of the week dispatches from Tokyo said that talk of war was ridiculed there, altho it was thought that some estrangement would follow a failure here to discontinue what was regarded as offensive discrimination. Reports in this country about preparations for war appeared to have no foundation in fact. Much was said concerning the ordering of two companies of coast artillery to Hawaii, but it was shown that this movement was in accord with plans made some time ago. The land bill recently passed in Arizona is to be signed. Four hundred Japanese residents asked the Governor to veto it.

Labor Controversies

In several labor disputes last week there was much disorder. At Paterson, N. J., where 20,000 silk workers have been on strike for a long time, under the direction of the Industrial Workers of the World, Patrick Quinlan, a strike agitator and leader, was tried and found guilty of inciting riot. Sentence has not been pronounced, but he may be sent to prison for seven years.

In resentment he and his followers promised to "wipe the city off the map." They planned to put out the electric lights and to stop the street cars by calling out the power house workmen, but these refused to quit work. Several recent attempts to wreck trains on the Erie road are connected, it is believed, with this strike.

At Wharton, N. J., where mine workers are on strike, 300 feet of a railroad which the employing company owns were destroyed by dynamite. In riots at Cincinnati, due to conflicts between street railway strikers and strike-breakers, four persons were fatally injured. The Governor of the state refused to send troops and the Mayor urged a receivership for the railway company. During a strike of barbers in New York City, property was destroyed and bullets were flying about, but no one was badly hurt.

Representatives of the strikers at the coal mines in West Virginia appealed to Senator Kern, urging him to cause an official inquiry to be made. In the Senate he sharply criticised the state's courts, because they had approved the sentences imposed by a military tribunal. He argued in support of a resolution providing for an investigation by the Senate.

The Philippine Islands

Mr. Daniels, Secretary of the Navy, at a dinner in Savannah, a few days ago, said that the United States ought not to have taken the Philippines. The traditions of the nation had been violated, he continued, by the acquisition of them, and the sooner the burden was thrown off the more American our Government would be. We ought not to have outlying dependencies.

At a banquet in New York on June 12 questions relating to the political future of the islands will be considered. This banquet is to be given by the Philippine Society, of which ex-President Taft is a member, and it is expected that he will be one of the speakers. It is understood that among those interested in the meeting are certain persons who have planned to invest large sums in the islands, for the development of industries, but are now restrained by the attitude of the Government at Washington with respect to Philippine independence.

Mexico

The Federal troops sent up by sea to Guaymas suffered heavy losses in the three days' fight with the rebels in Sonora. On the field 500 dead were to be seen, and 200 were made prisoners. Both parties are now putting to death all the commissioned officers captured. At the end of last week the rebels were preparing to attack Matamoras. Governor Carranza, the rebel leader in the north, has issued a decree subjecting Huerta to the law of 1862, which provides for the summary execution of any one who kills or attempts to kill the President. Huerta, if captured, he says, must be shot for the assassination of Madero. He also gives notice that any loan negotiated by Huerta will not be paid by the rebels, if they obtain control of the Government. It is reported that a loan of $25,000,000 has been negotiated in London.

Secretary Bryan denied, last week, a report that our Government was investigating the conduct of Ambassador Wilson. Such stories, he said, embarrassed a diplomatic representative in the performance of his duties. Some think this indicates that Mr. Wilson will not be disturbed. France recognized the Huerta Government last week. It is understood that the United States will wait until after the election in October. Mexican papers say that recognition at Washington has been prevented by American owners of mines in the north, who desire to promote annexation of the northern states now in revolt, and that these Americans have the support of at least six senators.

Dr. Fabela, a member of the Mexican House, is now in Havana, to which he fled, he says, for safety after asking the Huerta Government to explain why it had suppressed one of the newspapers at the capital. Twenty Liberal members, he asserts, have sought safety by flight. Enrique Sobral, Mexican Consul General at New York (appointed by Madero), was ordered, last week, to return at once to the capital. As he could not find out why the order had been given, he resigned and decided to remain in the United States. Heriberto Barron, now in New York, and formerly commercial agent of the Madero Government in the United States, has sent to the Mexican House charges against Huerta, who, he says, is guilty of conspiracy, usurpation and murder and should be punished by death.

Cuba's New President

President Wilson has sent to Cuba, as special envoys to attend the inauguration of President Menocal, Dudley Field Malone, Third Assistant Secretary of State, and Brigadier General Crowder, Judge Advocate General of the army.

General Menocal says Cuba is in great need of a sufficient number of good primary schools. His administration will have this in mind. Normal and trade schools will be improved. He will promote the construction

of additional highways and railroads, encourage immigration, and heartily welcome the investment of foreign capital. There should be agricultural banks, he says, and warehouses at the chief ports for the storage of sugar. He desires to cultivate the closest commercial relations with the United States. If our duty on sugar should be removed, he adds, the treaty of reciprocity would die, foreign producers of sugar would compete successfully with Cuba in the United States, and Cuba would suffer almost irreparable injury.

The Cuban Senate rejected a House bill making an appropriation for sending a company of soldiers to attend the "Maine" memorial services in New York because it provided that there should be negroes as well as whites in the company. A joint committee was appointed to consider this disagreement.

Central America

Prominent men in Salvador have sent to their Congress a protest against the treaty recently negotiated with Nicaragua by the United States, asserting that it affects injuriously the rights of Salvador and Honduras. This is the treaty which grants to the United States exclusive rights with respect to the construction of an interoceanic canal on the Nicaragua route, and a naval station on the shore of the Gulf of Fonseca. Such a station would be very near the adjoining coasts of Salvador and Honduras. It has been understood that the treaty will not be supported by the present Government at Washington.

When Guatemala did not respond promptly to Great Britain's demand for the payment of interest on her foreign debt of $10,000,000, a British cruiser was sent from Jamaica to Puerto Barrios. Guatemala then agreed to resume the payments, which were discontinued fifteen years ago. When the loan was obtained, Guatemala undertook to use a part of her export tax on coffee in satisfying the bondholders. President Cabrera, on the 14th, ordered that two-thirds of this tax be set aside hereafter for the interest. When the British demand was made, a few weeks ago, he appealed to our Government for assistance.

South America

A revolutionary plot was discovered in Ecuador by the Government, at the beginning of last week, and the purpose of the conspirators was frustrated. They were prominent Conservatives, who, in association with friends of the late President Eloy Alfaro (lynched by a mob a little more than a year ago), had planned uprisings in Quito, Guayaquil and other cities. The revolution was to begin on the 15th, and at the same time there was to be a similar revolt against the Government of President Restrepo, in Colombia.

Brazil's Minister of Foreign Affairs, Dr. Lauro Muller, has sailed for the United States on the battleship "Minas Geraes," to return the official visit made in 1906 by Senator Elihu Root, then Secretary of State. He was accompanied by the American Minister, Mr. Morgan, as far as Pernambuco.

Brazil has extended to the end of 1913 the tariff preferentials in favor of certain imports from this country. It was expected that these would be discontinued on account of our prosecution of persons interested in the so-called Coffee Trust, or valorization project, which has been supported by the Brazilian Government. The preferential, or rebate, on annual imports of $3,000,000 worth of flour is 30 per cent. In the Senate at Washington, last week, Mr. Norris sharply criticised our Department of Justice for discontinuing the prosecution of the valorization agents.

The governing board of the Pan-American Union has decided that the fifth Pan-American Conference shall be held in Santiago, Chili. This selection was made upon the motion of the Minister from Argentina, seconded by the Ambassador from Brazil.

The Suffrage War

By the failure of Mr. Dickinson's bill enfranchising women, reported in this department of THE INDEPENDENT last week, all hope of "votes for women" being conceded during the life of the present Parliament are at an end. And probably the cause can triumph only by its adoption as an issue at a general election, or by the election of 305 candidates (assuming that Home Rule reduces the membership of the House from 670 to 609) pledged to place the suffrage question above all other political issues. Up to the present time the two great parties have been internally divided on the issue. The vote on the Dickinson bill was enlightening in that it showed only 28 Unionists supporting the suffrage extension (114 opposing it). The leaders of the Unionist party either spoke against it, or were absent. Apparently the suffrage workers need not look for assistance from the Opposition.

The correspondents of American newspapers report a general and growing antipathy for the suffrage propaganda, in both urban and rural districts. This is attributed to the violence of the extremists.

Dr. Anna Shaw, the American suffragist, is now in London, and frankly states that British militancy is an obstacle to the extension of the ballot in America. American men tend to conclude, after reading the cable dispatches, that women are not safe persons to entrust with the ballot; and this makes them vote against universal suffrage in their own states, she is reported to have said.

Every day the finding of more suffraget "bombs" (none of which go off) is reported. Some of them are unquestionably hoaxes—planted by practical jokers. Others are almost as certainly constructed and placed by serious-minded suffragists with a view to increasing public uneasiness. Vandalism has been practised, however, and fires set; that in St. Anne's Church, Eastbourne, England, was extinguished (this was on the 15th), as also that in the William Penn Church in Buckinghamshire. Plans to kidnap a Cabinet minister, and the children of several ministers, have been foiled, it is said.

In spite of a police order prohibiting it, *The Suffragette,* the weekly journal of miltancy, continues to appear. The latest issue proved to be uncommonly mild in language, however. A labor organization issued the paper from its press, and Ramsay Macdonald, M. P., chairman of the Parliamentary Labor Party, attacks the attempt at suppressing the journal on the ground that free speech is endangered by such action.

British Notes

The Unionist party scored a victory at the bye-election in the Newmarket division of Cambridgeshire on the 16th. The Unionist candidate, Denison Pender, won over his Liberal opponent by 851 votes, in a Liberal constituency. The leader of the Ulster Unionists, Sir Edward Carson, addressed an enthusiastic audience of Ulstermen at Belfast on the same day. He renewed his attack upon the Home Rule bill, and his revolutionary threats.

The King and Queen of England's departure to Berlin to attend the marriage of the Kaiser's daughter, the Princess Victoria Luise, to Prince Ernst of Cumberland, was scheduled for the 19th. The wedding will occur on the 24th, and the British King and Queen will return May 28 or 29. Viscount Morley is also booked to visit Berlin.

The long standing controversy between Great Britain and Germany over the Bagdad Railway, which is to run under German auspices from Konia in Asia Minor to the Persian Gulf, is, it is said, practically adjusted.

France and Germany

M. Barthou, the French Prime Minister, declared on the 15th that the retention of soldiers whose time of service has expired is inevitable in consequence of the European situation. This announcement was made in reply to an interpellation in the Chamber of Deputies. A critic of the Government declared that the premier's action was depriving a quarter of a million of young men of their liberty, and France of their useful services. A Radical Republican, M. Lachaud, added that the French barracks were breeding places for tuberculosis. But the Government's military policy was approved by a vote of 315 to 241.

Georges Clemenceau, formerly Prime Minister, has launched his fourth newspaper, which he calls *L'Homme libre*—"The Free Man." His earlier political organs have been *La Justice* (1888-1900), *Le Bloc* (1900-1902), and *L'Aurore,* which he conducted from 1897 to 1906, founding it to fight the battle of Dreyfus against the conservative and military parties. It is said that M. Caillaux—a wealthy politician whose recent ministry was discredited by a scandal reflecting upon the patriotic honor of its chief, who was interested in certain investments affected by negotiations between France and Germany—contributes $200,000 of the Clemenceau capital. The reentry of this famous cabinet-breaker ("The Tiger," he is called) is the more significant in view of his bitterness toward President Poincaré and the existing Government. Clemenceau is over seventy years of age. He opposes electoral reform, and tho he told an interviewer not long ago that he favored the three-year law for military service "without dispensations, exceptions, or alterations," there is some doubt as to the practical sincerity of this statement.

The French Prime Minister recently attended a meeting of the General Association of the Students of Paris. The president of the association, M. Viaud, told the Prime Minister that the students desired no partiality shown them in regard to military service: only such regulations as would guard against students serving under the flag losing the progress actually attained in their studies. M. Liard, Vice-Rector of the Academy of Paris, said in his turn that the students were "resolved upon the most extreme sacrifices, being ready to obey the law with cheerfulness." The Prime Minister repeated the statements of the other speakers that French culture must be defended—but to be able to defend it France must, first of all, be able to defend her soil. "The three-year service law was already an accomplished fact," he asserted.

The amendment of the French law regulating public gambling, passed in 1907, is proposed. This law imposes a tax of 15 per cent. One of the amendments suggested would apply a sliding scale—rising to 50 per cent. The Government opposes such amendments as would, in its opinion, favor clandestine gambling houses at the expense of more orderly establishments operating under the law. But it is charged by certain deputies that rich visitors to Paris are fleeced on a wholesale scale by uncommonly bold sharpers, and politicians are accused of shielding these establishments from police interference.

The Federal Council of the German Empire is considering exceptional measures to prevent the growth of the anti-German feeling in Alsace-Lorraine. French newspapers in the annexed provinces are to be suppress by the Governor. He regards them as hostile to the Imperial regime, and any society deemed subversive to public order is to be subject to his dissolution.

Elections were held on May 16 for the purpose of choosing the electors who on June 2 will name the members of the next Prussian Diet. The result suggests no considerable change in the color of the Diet, tho the Socialists hope to increase their representation slightly. Little interest was manifested by the general public, which naturally regards the complicated election machinery of Prussia with disfavor.

The German Government's Petroleum Monopoly bill, aiming at the extinction of the Standard Oil Company in the Empire, seems to be dormant. Perhaps it will never be revived.

The Balkans and Armenia

Mutual distrust among the Balkan allies is on the increase. Servia and Bulgaria make conflicting claims to territory in Macedonia. Bulgaria and Greece are said to be at daggers' points. Russia is the potential peacemaker between the allies.

On the 14th the international force of marines which is to occupy Scutari entered the city and was enthusiastically received by the Albanian natives.

Bulgaria reports her losses in the late war as follows: Killed, 30,000; wounded, 53,000; missing, 3000. The Budget committee of the Duma estimates that the war entailed a loss to Russian trade amounting to $60,000,000.

The Armenian National Assembly, sitting at Constantinople, recently heard the report of M. Papazlam, a member of the lay council of the Patriarchate, just returned from a mission to Paris. The Armenian question was in a fair way to be solved, he said. In certain diplomatic circles the idea of sending into Armenia a permanent commission had been emitted, with a view to establishing an international control; the commission to include Mussulmen. But certain Armenians would accept only an international commission entirely European.

China

The bankers of the five-Power group made the first advance on the $125,000,000 loan on May 13, when $1,200,000 was paid over to the Chinese Government. This loan, at 5 per cent, or a large part of it, was to be issued this week, it was announced, $37,083,400 to be offered in London, the same amount in Paris, and smaller sums at Berlin, St. Petersburg and Brussels. It was expected that the loan would be offered to the public at 90 without the assistance of underwriters.

It is reported to the London *Telegraph* by that newspaper's Peking correspondent that China and Russia have signed a secret agreement by which the new republic concedes complete autonomy to outer Mongolia, the frontier of which has been delimitated. The territory gaining autonomy measures more than half a million square miles.

General Chang, President of the Chinese National Opium Prohibition Commission, is in England. His mission is to appeal for a release from the obligations imposed by existing treaties between China and Great Britain fastening upon the former state the yoke of traffic in India-grown opium. "Now that the Chinese people generally realize the evil that opium is doing to their country they find it hard to forgive England for insisting upon its importation," General Chang told an interviewer. "The poorer people are learning to read, and many of the new vernacular newspapers are very bitter. It would be going too far to say that there is a definite boycott against British goods, but certainly the tendency is not to buy them where something else does just as well. British influence in China is decreasing—solely on account of the resentment against traffic in this drug.

"How far this tendency goes," General Chang continued, "you will see from an amusing conversation I lately had with one of my servants. He had been sent to buy kerosene oil, and came back with an unfamiliar brand. He explained that one kind had a British trade mark, and the other was American. He unhesitatingly chose the American. You see, America gave us back her share of the Boxer indemnity, and she has given us recognition. Great Britain has given us—opium."

ADVERTISING AFFIRMATIONS
BY GEORGE FRENCH

XIII—A Wonderful Business Revolution

During the week beginning June 8 there is to be held at Baltimore one of the most interesting and significant conventions of business men ever seen in this or any country—the annual convention of the Associated Advertising Clubs of America.

There will, it is anticipated, be in the neighborhood of 8000 to 10,000 men and women there, gathered from all the countries of the world. Probably one-fourth of these will be official delegates from clubs and associations. While the organization is named "American" it is cosmopolitan. The association is made up of clubs of advertising men, some 140 of them, located chiefly in the United States, tho there are several in Canada, one in London, one or two, I believe, in Mexico, and one in Hawaii. There is also a Club-at-Large, which takes in all the advertising men who live in places where there is no club, or who happen to be at the convention without other credentials. There are now 10,000 members of this big organization—not all practising advertising men, but all directly interested in advertising as practitioners, buyers or sellers of advertising space and plans, or in some other way actually connected with the business.

This organization began its life in Chicago ten years ago. For five or six years it merely existed, gathering force for the great future that has now overtaken it. By four years ago it had attracted some of the vital men in the business, who saw that it had a great opportunity and believed that it would become the executive of a very significant change in the conduct of the rapidly growing business of publicity. They rallied, and elected to the presidency Samuel C. Dobbs, of Atlanta, who had not been identified with the association. For two years he threw himself into the work of building up the association to a condition of efficiency. Then George W. Coleman, of Boston, was made president. He took up the work where Mr. Dobbs laid it down, and threw all the energy and enthusiasm of his remarkable personality into the perfecting of the organization and giving it direction. During his first year all the energies of his administration were bent to the task of bringing in all possible vital advertising men. His second year, now closing, was devoted to getting the great aggregation of men fused into an organization with a consciousness and a purpose. Just what that purpose was to be was clearly revealed at the convention two years ago, held at Boston. There the men assembled discovered that they were business evangels, that they were shaping the most remarkable business revolution the world has ever seen. The proposition was definitely adopted that truth and morals are the most profitable business tenets. This led to the frank adoption of the Golden Rule as the best basis for business, for the sake of pure morals.

This definite creed of business found its first expression thru the gradual perception of the psychological truth that it pays better to tell the truth in advertising than to indulge in any of the varying degrees of falsification and deception which had always characterized much of the advertising. The Boston convention, in all of its departments and manifestations, was a great affirmation of that truth. It reverberated thru all the proceedings. It was the real theme of all the addresses. Nothing so interested the delegates as strong assertions of the newly perceived truth that it is better morals and better business to make the square deal the basis of business, and nothing so readily elicited their applause. The convention last year at Dallas took up the same shibboleth, and carried it far beyond the Boston mark. There the exercises of the week of convention meetings began with sixteen advertising "sermons" preached in sixteen of the principal churches of the Texan city by sixteen advertising men. The churches were crowded. The church people attended the convention meetings. The ministers joined with the advertising men to make the meetings popular and interesting. The slogan was "Honesty in Business." Nothing but some variant of that theme was really popular. The most successful meeting was on Sunday afternoon when the president of the association addressed a great audience upon the topic, "The Church Outside the Churches," and drove home the theory that the business men were to base all their operations upon the Golden Rule.

This feature of the Dallas convention, the coöperation of the churches, brought business and ethical religion onto the same public platform, and was a frank confession from both that one could not successfully promote its own welfare without at the same time promoting the welfare of the

other. It was in the nature of a formal notification to the public that business, so far as its publicity activities are concerned, had come to frankly accept and adopt the great fundamentals of religion that stand for and define actual brotherhood. The student of religion, or of economic conditions, or of business, cannot but realize that here was the public manifestation of a radical change in business motives — a change which will, when it has been given time to become more generally operative, profoundly affect both business and religion. It is indicative alike of the broadening purpose of religion and the exhaltation of the practice of business. It indicates that right-thinking men have come to the conclusion that business and religion draw their best inspiration from the very same fount. That these advertising "sermons" were the most popular feature of the great convention at Dallas is in the nature of endorsement of this view of their significance. This public approval was made manifest in many ways by the church people.

To what extent this doctrine of business morality has taken possession of business cannot be appreciated by him who has not followed the course of advertising since it became fairly entitled to call itself a profession. Only a few years ago anything in the way of deceptive statement and fraudulent practice was allowable in advertising. The vile doctrine of *Caveat Emptor* prevailed everywhere and in all lines of business. The advertisement and the goods advertised were not supposed to resemble each other. Advertising was, largely, a system of deceit and misrepresentation. The magazines and newspapers were full of fake and false advertising. Newspapers regarded their pages as billboards, space upon which was for sale to whoever could pay for it. It was not strictly "The public be damned," but it emphatically was "The reader be damned," if he cannot look out for himself, and sort the truth from the lies.

Now it is different. There is not in the country more than one or two big newspapers that do not at least pretend to exclude false, misleading, fraudulent and harmful advertising. The concerns that have reaped millions from too credulous readers of the papers and magazines can now only get their advertisements into the cheapest and most obscure of mediums. Practically all of the magazines and weeklies, and many of the daily newspapers, are as free from objectionable advertising as the Sunday schools are free from obscene conversation. There are exceptions. There are papers that still continue to accept business that they know is intended to deceive and defraud the readers. There are still advertisers, too many of them, who make use of falsehood and deceptive methods. But they are examples that are steadily becoming sporadic and isolated. Those department stores that still make use of the stale old devices to create a false appearance of prosperity are becoming isolated. They are well known. "So-and-So do not tell the truth in their advertising," is heard of some stores, and they are losing the trade and confidence of the public.

In short, there has been a great revolution in business. It is getting to be a habit to believe what dealers in standard goods tell the customers. The whole character of advertising has radically changed. How radical this change is can only be realized by going back ten or twenty years and carefully going over a file of popular periodicals, or the files of the newspaper that is now clean and truthful in its advertising.

The convention next month at Baltimore will be the most remarkable business gathering ever held in America. It will be large and enthusiastic, and the exercises will be interesting and inspiring; but the most remarkable feature will be the thought that it all stands for a new era in business, an era in which good faith and brotherhood are the controlling forces, instead of *Caveat Emptor* and "the devil take the hindermost." This is remarkable enough to attract the earnest attention of the sociologists and the psychologists, as well as the religionists. The advertising clubs have accomplished more for business morality, in the space of four or five years, than all the laws that have been enacted, all the churches, all the colleges and universities, all the various "movements" and organizations for the betterment of humanity. It is quite true that the revolution had its rise in self-interest. The advertisers found that it was better policy to tell the truth and so win a permanent customer, but in working this theory out many of them have found that there is a higher purpose, and a better profit than all dollars.

This great convention will be worthy the study of those who hope for some distinct uplift that will permanently affect humanity, as well as of those who wish to know how much more profitable it is to be honest in business than to be dishonest. It will also interest the student of history, as it will exemplify a great phenomenon that is to be peculiar to the twentieth century—the phenomenon of men giving themselves unreservedly and unselfishly to the betterment of their brother men.

IN THE INSURANCE WORLD

BY W E. UNDERWOOD

Workmen's Compensation Insurance

It is probable that before this article appears, Governor Sulzer of New York will have taken definite action on the Foley-Walker workmen's compensation bill recently passed by the legislature. If he approves it, employers will have their choice of four plans for protecting themselves against the liabilities the law will impose and they may proceed intelligently to make their plans to that end. The general feeling of the advocates of the bill is one of fear that the Governor will veto it. As pointed out by us last week this will be unfortunate, for it will retard the progress of the system of workmen's compensation in the State of New York, where it is needed most.

We have two suggestions to offer for consideration in the event the bill is vetoed, and we presume that both of them are legally practicable. If the existing insurance laws will permit of it, we advise employers themselves to inaugurate the system of workmen's compensation insurance, using either one, or both, of two methods provided in the Foley-Walker bill. That is, that they organize mutual associations among themselves for the purpose, or induce the casualty companies to formulate contracts that will effect the objects in view. And, upon the same hypothesis of legality, we commend to the consideration of the casualty companies, whether employers do or do not take the initiative, the advisability of draughting a policy or policies that will provide the proper coverage. In specific terms these contracts between employers and companies may abjure all benefits accruing out of the common law defenses and, just as fully as if there were a workmen's compensation law in force, provide the industrial classes with the protection they so much need.

If the bill is approved, employers should see to it that the casualty insurance companies are confronted with competition by organizing mutual associations among themselves, employing for their operation and management men of ability and insurance experience. They must avoid the folly committed by the assessment life insurance organizations which flourished so vigorously twenty to thirty years ago. Its victims are still with us, tho the associations are on the scrap pile. Insurance is a commodity that must be paid for at the rate of a hundred cents on the dollar. It performs no miracles. If you don't pay its actual value today, you will pay exactly that and a penalty tomorrow.

Properly managed mutual associations must eventually render the service at a cost something lower than that provided by stock companies. That form of organization also has its disadvantages in the shape of liabilities accruing to the individuals composing the membership, but unless we err in judgment all this will be scientifically provided for in advance by actuarial skill and the accumulation of experience.

It is to be hoped that Governor Sulzer will approve the Foley-Walker bill, but, with or without a specific law on the subject, we see no good reason for postponing the inauguration of workmen's compensation insurance in the State of New York.

Stock and Mutual Life Insurance

Replying to the inquiry of a reader as to "the comparative merits of stock and mutual life insurance," we must admonish him that the subject is a comprehensive one, and that our space is limited. We may only sketch the answer.

Considered from the viewpoint of the policyholders' interests, the strictly mutual form of organization is superior to all others. As at present regulated and supervised, all forms of level-premium-reserve life insurance are sound; the contract privileges and benefits may be regarded as identical. The principal points of superiority inhering in the mutual form, and they are important, are (1) control by the policyholders and (2) the lower net cost of the service.

As to the first: To make the statement very conservative, it is at best not satisfactory that a stock interest of a few hundred thousand dollars should control ten, sometimes hundreds, of millions of assets that secure from two to three times that amount of policyholders' insurance. The control of these large accumulations by a few stockholders has been used, and may continue to be used, to increase their private fortunes. A great, and sometimes a dangerous, power is thus exercised. The

control of this money may become a commodity, worth in some cases many thousand times its apparent, or certificate, value in the financial market. It may at any moment become the instrument of speculators. The value of the stock itself is insignificant; the control of the assets, everything, increasing in proportion as its owners are only legally honest or better.

Now as to the second point, net cost: It should be obvious that the expense of conducting two equally well managed companies, one a mutual and the other a stock, is less in the one than in the other. This is not saying that the net cost in all mutuals is less than it is in all stock companies, but when it is not, the management of the mutual is at fault, for it should be less. As compared with the most ably conducted mutual, the cost in a stock company possessing a management equally skillful is necessarily greater by the sums paid stockholders as dividends—and in a number of instances these represent, annually, a heavy percentage of the original investment, say from 50 to 200 per cent.

So, to conclude: The members of a mutual company can dismiss, if they so desire, their management and install another; policyholders in a stock company have no such power, and it is possible for the control of the latter to become a marketable commodity. Finally, the net cost in a mutual is usually, and should be always, less than in a stock company.

Fire Prevention Work

The National Fire Protection Association, which held its annual convention last week, adopted one simple resolution that will do much to broaden the scope of its work and hasten the day of coöperation with it by other economic and civic organizations. As a means of extending its influence, a special committee has been appointed for the purpose of spreading the gospel of fire prevention by interesting such bodies as the National Association of Credit Men, the American Institute of Architects and others in its work, and by an interchange of data to disseminate among the general public the knowledge necessary to a betterment of the conditions which, at the present time, result in the destruction of values annually estimated at nearly a quarter of a billion dollars.

The association formally calls upon all cities and towns to adopt proper building codes and compelling the use of fire-resisting construction in congested districts; upon all state and municipal authorities to regulate the transportation of inflammable oils and explosives and the investigation of all fires; upon the public to bring about a safe and intelligent celebration of Independence Day; upon the proper authorities to require the introduction of automatic fire extinguishing apparatus in all commercial establishments and city blocks; upon the press for the continuance of its support and in the further dissemination of information on the subject.

It is to be hoped that this call will be heard by the least and greatest in all the land, for our fire waste bill yearly is a disgrace to us as a nation. We seem to forget that burnt property represents values that are annihilated. Insurance does not replace; it merely distributes loss. The man who has no insurance is keenly alive to the fact that fire reduces his thousands to the figure naught. Under proper laws, faithfully enforced, it is probable that the annual fire waste could be reduced seventy-five per cent. It is our duty as law and order loving people to earnestly undertake the task of reducing it.

Also Farmer Lott

"Back to the farm"—that is the cry in the soul of Mr. Edson S. Lott, president of the United States Casualty, who, if you've ever heard him at any post prandial exercises, you know was born and reared in bucolic surroundings on the shores of Lake Keuka in the vicinity of Penn Yan, N. Y. He has bought a farm—nearer New York than Penn Yan—has resigned from the International Association of Casualty and Surety Underwriters, and during the summers hereafter, instead of going to the annual conventions of the latter, will superintend the harvesting of his crops. The farm will also be a periodical place of refuge at those times when the general cussedness of managerial rivalries and field competition weary and disgust.

Manhattan Life Gets a New President

Vice-president John F. Roche, of the Manhattan Life Insurance Company, announces the retirement of president M. W. Torrey and the election of Thomas E. Lovejoy, formerly of Montgomery, Ala., as his successor. Mr. Torrey will take a much needed rest. Mr. Lovejoy brings youth, vigor and the prestige of former successes to the service of the company, and in the best of spirit we desire to say that these qualities are greatly needed in the Manhattan Life. It has been too conservative, we may say non-progressive, for a decade or more, and the addition of two such enterprising young men as are Messrs. Lovejoy and Roche is a positive improvement.

FINANCE & TRADE

Oil Company Dividends

The former subsidiaries of the Standard Oil Trust are still distributing very large dividends. Last week there were three that excited comment. The Standard of New York gave notice of an approaching stock dividend of 400 per cent, amounting in par value to $60,000,000, the company's capital being $15,000,000. Therefore the price of shares rose to $700. A little more than a year ago it was $260. The South Penn Oil Company, in addition to its regular dividend, announced a stock dividend of 300 per cent. Shareholders of the Standard of Nebraska received a regular semi-annual dividend of 10 per cent, an extra cash dividend of 5 per cent, and a stock dividend of 25 per cent.

Testifying in the ouster suit brought by Missouri, the officers of the Standard of Indiana asserted that their company was in no way connected with any other oil company, but had become absolutely independent.

The Bucket Shops

Bucket shops, as they are called, have not been driven out of business by the sharp attack of the Federal authorities two years ago. A member of the New York Stock Exchange recently made a tour of investigation thru the State of New York and found many of these concerns in operation. There are two or three chains of them, and the central office of one of these chains is in Pittsburgh. The local agencies, or "brokerage houses," are scattered thru the country. A majority of them are in small cities, but they may also be found in large ones. For example, the investigating member of the New York Exchange found in Buffalo one whose orders in a single day amounted to 8000 shares, while only 11,000 shares were bought or sold in the same day by the local representatives of well-known New York firms. It should be understood that orders given to a bucket shop are not executed on an Exchange.

Officers and members of the New York Exchange are now getting evidence which will be given to the Federal or local prosecutors. This is what the Exchange ought to do. It can well afford to employ detectives for the work, and it should pursue the bucket shops with vigor. Exchanges where securities or grain are actually bought and sold have suffered in the estimation of a considerable part of the public by reason of the swindles of bucket shops, whose managers claim to be members of such Exchanges.

Beef from Abroad

The tariff duty on meats is still in force, and will be for several months, but exporters abroad are preparing to take advantage of the removal of it, and are even now making shipments. At San Francisco, last week, 400,000 pounds of frozen beef and mutton from Australia were landed, and the understanding in Australia was that this meat should be sold at only a nominal profit. It is the intention of those engaged in this trade to increase the shipments to about 500,000 pounds a month.

It is not yet known whether beef will be exported to this country from Argentina. Chicago packers associated with what has been called the Beef Trust have large interests in the beef industry there, and the Argentine Government is now inquiring as to their methods, owing to the complaints of cattle breeders and native competitors. It is said that shipments to London, the chief market, have been regulated by pool allotment, and that the failure of a Chicago firm to gain an increase of its allotment caused sales, in resentment, which reduced prices in London last week. Probably this Chicago firm will ship Argentine beef to New York after the removal of the duty.

The Stock Market

Last week's transactions on the New York Stock Exchange amounted to only 950,645 shares, or one-fourth of the number for the corresponding day in 1912. Net changes were not large, altho one or two new low records were made. On Thursday the New York, New Haven & Hartford Railroad Company reduced its dividend rate to 6 per cent, after paying 8 for eighteen years. This reduction was due in part to the recent passing of dividends by the Boston & Maine and the New York, Ontario & Western. The New Haven Company owns $50,000,000 of the stock of these roads. Its shares are held by 22,716 persons, 11,162 of whom are women. Among the holders are also 3666 trustees.

The Presbyterians and Union Seminary

The one matter of general interest that came up in the proceedings of the Northern Presbyterian General Assembly was its attitude toward Union Seminary. The seminary was once in a measure, despite its name, attached to the Presbyterian Church and reported annually to its assembly. Some twenty years ago the seminary got its freedom, at the cost of the condemnation of two of its professors, who left the Presbyterian Church to join the Episcopalians and Congregationalists. The assembly, two years ago, made overtures that it come back, and a committee was appointed to consider the way. During the year it held conferences with the directors of the seminary and asked it to give satisfaction as to its theology and to appoint additional professors who should give instruction in the doctrines of the Westminster Confession and Catechism and in polity, so as to give the students such instruction as would make them acceptable candidates for Presbyterian pulpits. The directors said they had not the means to found professorships, but would establish lectureships that would be satisfactory. They also offered a mild, irenic creed. This was not fully acceptable, and the committee reported and asked that they be continued another year.

Of the two minority reports, one regretted that the seminary failed to give a satisfactory account of its doctrinal position and asked that the committee be discharged from its useless task, while the second, made by Dr. Monfort, of the *Herald and Presbyter*, declared that it would not be satisfactory to have some new professors who would teach the Confession of Faith, while other professors attacked it, that all should be its earnest defenders. He sharply criticised the relation to the seminary of the New York Presbytery, which ordains students that deny the faith.

President Francis Brown, of the seminary, in a long address, defended its position independent of any denomination, and the professors who had been severely assailed, and plainly told the assembly that it had asked no recognition, but was present at the assembly's invitation, and that he would be satisfied to have the whole matter dropt. The assembly laid the matter over for a year.

It had better be put over for twenty years. Time will settle it. Union Seminary is going on very well, and its graduates are acceptable to the churches. The theology which Dr. Monfort and his associates teach is less and less acceptable. They would have been amazed if they could have heard the addresses made at the alumni dinner at Drew Seminary, Methodist, last week, by Dr. Eckman, representing the *Christian Advocate*, and Professor Rogers. It is the business of seminaries to go forward and not to pull back. It is our Lord's social gospel that has to be preached now, not raw Calvinism. We can hardly imagine a worse doctrine than that uttered in his sermon before the assembly by its retiring moderator, Dr. Matthews, who said:

> We should change the ground of our objections to candidates for the ministry who doubt or deny the deity of Christ. They ought to be rejected, not alone because they

doubt or deny *per se* the deity of Christ, but because their denial is prima facie evidence that they have never been regenerated. No regenerated man can doubt or deny the deity of Christ, because you cannot doubt that which you know and you cannot sincerely deny that which is to you a living, personal fact. No unregenerated man should be permitted to preach.

That is a shocking doctrine, that no man can be regenerated who does not know by a living, personal consciousness that Christ was God. That condemns Isaiah (chap. 6), and John Milton, and Edward Everett Hale. It contradicts Paul, who says that love is superior to faith, and Christ, who did not put it into the conditions he gave to the young ruler. As an evidence of regeneration it is not found once in the whole Bible. Dr. Matthews has borrowed it from the cursing and accursed clauses of the Athanasian creed.

But Union Seminary is not so bad as they make out. If Professor McGiffert and Professor William Adams Brown are heretics, there is Professor Briggs, whose late volume is grandly conservative, and stoutly defends the virgin birth of our Lord.

Mr. Bartholdt's Resolution

We took the liberty to suggest the adoption of a new amendment to the Constitution, which should give to the Federal Government entire control of all matters affecting the rights of aliens residing in the United States. We are glad to see that Congressman Bartholdt, who takes a special interest in all matters of international peace, has introduced a joint resolution providing that all such questions shall come under the exclusive power of Congress.

It is not the present discriminatory legislation of California against the Japanese, nor its attempted earlier legislation to segregate Japanese children in public schools, that first made it clear that single states must not endanger peace with other nations. Attention was called to it years ago when, in New Orleans, there was a riot in which citizens of Italy were killed, and no one punished for it. At that time the Italian Government made vigorous protest, and the United States paid a money indemnity to Italy for the act of Louisiana. A second similar case occurred later. It is very hard to make foreign governments understand how our Federal Government can dodge responsibility for injuries done under the states rights power given by our Constitution.

Early Marriage

That was a false story that ran the rounds of the press some weeks ago, but did not get into our columns, that a club of girls in Wellesley College had pledged themselves not to marry for five years after graduation, and then not to marry any man with less than a five-thousand-dollar income. It was the invention of an unscrupulous reporter of his own imaginations. An investigation by a responsible board of the students themselves proved that no such club existed.

But it is true that both President Lowell and ex-President Eliot, of Harvard, have given to their students the wise but unusual advice to marry early. President Eliot goes farther. He does not like to see so many young male immigrants coming to this country, and he would restrict the number, allowing freely those to enter who bring their wives and children.

For early marriage the arguments are many and weighty. They include morality, steadiness, responsibility, parenthood, unselfishness, industry and character. It is on the family that worthy civilization rests. Marriage is honorable and decent. It is the solid basis and the preservative of society.

The usual objections to early marriage are unworthy, selfish and cowardly, and are called prudential. Instead of an ambition to take up the responsibilities of caring for a companion in life and children, young men, and young women too, wish to delay care and to enjoy the frivolities of unattached life. Then too often there follows the belated, prudential marriage, which continues to avoid the responsibilities of parenthood, or talks nonsense about children few but well born. In old days there was a pride in large families; now the reverse is too much the case. The well-born genius of the family is quite as likely to be the fourth or tenth child, and the race is enfeebled in brain and muscle which lim-

its the chance of superiority. We would rather have clubs in colleges of either sex whose members would choose to marry young, to accept social burdens, and who will hope to be the proud parents of numerous descendants. That is a worthy ambition. Children of such parents will rule the country, will create a country that will lead the world. Those who put off marriage are selling their country to the numerous children of the untrained and the ignorant. Out of love of country, if for no other reason, those who have the privilege of education, and the superior mental structure which has sought it and can transmit it, ought most of all to seek early marriage and such families as are infrequent in decadent France.

Who Is Smith?

Dr. Hesselgrave's picture of Smith is one of those definitive pieces of work that get done now and then. Smith has heretofore been portrayed and analyzed by friendly and unfriendly hands, but not by accurate ones. His abilities and achievements have been set forth in flattering lines. His delinquencies have been explained and his sins accounted for, or he has been cursed and damned, and the attention paid him has been more than wearisome to the rest of the population. Dr. Hesselgrave, with a few bold and unmercifully truthful strokes, depicts him as he is. As an illustration of how to tell the truth, the whole truth and nothing but the truth, without waste of time or materials, Dr. Hesselgrave's portrayal of this respectable humbug, Smith, leaves nothing to be desired.

But who is Smith? In a general way he is easily enough discriminated from the crowd. As an average middle class American, successful as a money getter, conspicuous as a money spender, believing himself to be an important personage when in fact he is a failure as a producer of wealth, posing as a man of common sense with unlimited practical knowledge when in fact his ignorance of everything worth knowing is appalling, he is to be found in every industrial town, and the subway trains of New York City carry tens of thousands of him up and down the tracks every business day of the year.

But to pass from this somewhat general placing of Smith to a more particular identification, is not so easy as might be anticipated. The American middle class is not made up exclusively of Smiths, and it is a question worth asking whether in that middle class there are today more or fewer men of the kind that Dr. Hesselgrave describes as Smith's progenitor than there were a hundred years ago. Men who are a power in political life, men who handle big business affairs in a sane and intelligent way, and on the whole with consideration for the larger interests of human society, men with good sized families of sturdy boys and girls, well brought up and taught to meet the obligations of life as well as to enjoy its pleasures—there are legions of them left. That the descendants of the Puritans today far outnumber the Americans of Puritan ancestry in any decade hitherto, and that among them there are more men and women than ever before with a strong sense of social and civic responsibility, devoting time and money to conscientious service of the public and, rearing children that will worthily succeed them.

Nevertheless, Smith is a fact and he is a failure. Altogether too large a percentage of the middle class, he has wrought infinite mischief, and the world will rejoice in his elimination, by whatever processes of social or natural selection he is made away with.

Is it possible to prevent his recurrence, generation after generation? Certainly not altogether. No human stock is so perfect that it does not produce a percentage of weaklings and crooks. But we suspect that Smith is not altogether a victim of heredity. At a time when the opportunity to exploit natural resources and the credulity of mankind created astonishing chances to get rich without virtue or brains, the power of the Church to maintain moral discipline in the community was seriously impaired by its failure to meet sincerely the reconstruction of thought by natural science, and the disciplinary function of school and college was nearly destroyed by educational fads and sentimentalities. Smith has had accomplices in his evil conduct.

There will always be Smiths, but we feel reasonably confident that from this time forth the number of this precious

tribe will diminish. As Dr. Hesselgrave reminds us, political power has passed into more vigorous hands. The reorganization of the industrial world, already under way, will deprive Smith of unearned increment. An educational policy saner and stronger than we have enjoyed in recent years, and a Church once more sincere and straightforward, will bring to bear a moral discipline that, we are sure, will save many a young fellow born with good enough parts, from becoming that respectable fraud, Smith.

The Paterson Strike

Rabbi Mannheimer gives our readers this week one side, and a strong side, of the labor conflict in which the workers in the silk mills of Paterson, N. J., are engaged, under the advice of leaders of the Industrial Workers of the World. Mr. Mannheimer much disapproves the principles of the I. W. W., as do we, but he praises the leaders—Haywood, Quinlan, Tresca, etc.—for their peaceful conduct of the strike, which has broken no heads and killed nobody. That certainly is something; but illegal and criminal violence may exist without murder. The law allows pickets in a strike, but the pickets must use no force, must not put a hand on those who go to work. They may ask them to stop and listen, but if they refuse, must go no further, and they must not block the streets; they must move on.

Now, in this strike, as in all strikes conducted by the I. W. W., there have been threats a-plenty. Haywood and his associates have declared that they must and will not allow any mills to open, even if its men desire. Some threats of the leaders have been disavowed by other leaders, but there have been violent threats enough to frighten those who wished to work.

One man has been convicted of threats of violence by a jury, and others will be tried. This is not a sentence by the whim of an ignorant and prejudiced police magistrate, but by the judgment of twelve men whom we are bound to believe impartial. They are neither employers nor employees. We are ready to believe that the mill-workers have grievances that ought to be discussed and corrected, but the purposes and the principles of the I. W. W. we condemn as fully as does Rabbi Mannheimer. Its methods of conducting a strike do not appear to us as innocuous as they do to him, nor do they to the citizens of Paterson generally, and on this ground Haywood and the other men have secured a trial by a jury from another county.

We agree with Rabbi Mannheimer that the adoption in Paterson of a protocol such as that agreed upon in the ladies' garment trade in New York is the best hope of peaceful industry. Employers and employees need not be enemies.

Briefs for Debate

Among the most frequent of the requests for editorial advice and assistance are those of readers who are preparing for a debate. The cultivation of debating in schools and colleges everywhere, and the revival in some parts of the country of the lyceum or public forum have created a greater demand for information on the questions of the day. THE INDEPENDENT has endeavored to meet this demand in two ways: first, by making its contents as varied and timely as possible; and second, by publishing articles on opposite sides of vexed questions, altho this latter policy often gets us into trouble with readers who do not understand it, and think that when an editor admits to his columns anything he does not believe in, he is hypocritical, vacillating or bought up by the enemy.

But the day of blind partisanship is passing. Not, we hope, the day of partisanship, for that would mean the end of progress. But to be a strong partisan one must know the strength of the opposing party. It is only when the knight has seen both sides of the shield that he is qualified to fight for the color he likes best. When we find intelligent men differing so decidedly as they do on matters of private belief or public policy, it is important to know why they think as they do, or, if such knowledge is beyond the reach of mortal man, at least to learn what reasons they have to give.

It is, then, for the purpose of aiding the ordinary reader to become acquainted with the chief points on both sides of pending questions as well as of providing for the needs of public debaters, that we

have started this week a new department, to appear from time to time, "Arguments in Brief." We have chosen as the first topic to be discussed the question of the exemption of American coastwise shipping from the Panama tolls, a question on which we have exprest some very positive views in language as vigorous as we could command. This is at the present time a favorite question with debating societies; it is also one upon which every American citizen must make up his mind, because it devolves upon him to settle it. A few minutes devoted to the consideration of arguments here outlined will give him the bearings of the question. Then he can, so far as time and inclination allow, study the problem further by following up the references to books and articles where it is treated more fully.

There are many debating guides on the market that give briefs on the questions that we have always with us, such as tariff, trusts and socialism, but something more immediate and specific is needed, especially when the topics discust by debating teams are measures which are now before the people for consideration, and for which the material must be sought for the most part in current periodicals and public documents.

In the old-time lyceum the favorite topics were such as these: "Which is the more destructive, fire or water?" "Which is the mightier, the pen or the sword?" "Which was the greater, Napoleon or Washington?" "Which is the more enjoyable, spring or fall?" "Which is the greater novelist, Dickens or Thackeray?" "Which is the more attractive, art or nature?" "Which is the more injurious, war or alcohol?" These were selected for discussion because they were indeterminable. They were regarded, even the last mentioned, as beyond the reach of human power to settle, and therefore could be talked about indefinitely.

In recent years debaters have shown a different taste. The questions most used in intercollegiate meets during the past season have been practical, modern and American, such as the recall of judicial decisions, the income tax, the currency question, the restriction of immigration, woman suffrage, regulation of interstate commerce, the commission form of government, etc. These are neither indefinite, impractical, indeterminable nor interminable. They are all questions that are to be settled and settled soon, and settled in part by those who are on the platform and in the audience. They may be criticised as too exclusively political and national, but on the whole, the change is in the right direction and deserves to be encouraged. Our "Arguments in Brief" will be more of the latter character than of the former.

Sales for Export

Testifying last week in the Government's dissolution suit against the Steel Corporation, Mr. Farrell, president of the company, spoke of a reduction of prices for the export trade. When manufacturers here, he said, sought the company's products, intending to use them in making finished goods for sale abroad, the company was accustomed to sell these products to them at prices lower than those which were paid if the finished goods were to be marketed in the United States. This was done for the promotion of the export trade. In many ways the company had striven to increase the sales abroad of American iron and steel manufactures.

In making lower prices for export, he continued, the company was following the example of the United States Government, which encouraged the growth of exports by permitting or authorizing the railroads to make, for goods to be exported, a freight rate lower than the ordinary rate on goods for domestic consumption. This permission was given by the Interstate Commerce Commission, which had allowed such discrimination for ten years past. For example, the rate from Pittsburgh to San Francisco for goods to be exported was lower than the rate for goods of the same kind which were to be used in the Pacific Coast states. There was a similar difference with respect to the rates from Pittsburgh to New York and other Atlantic ports. The reduction was made with the knowledge and approval of the Interstate Commerce Commission.

The exaction from American consumers, by American manufacturers, of prices higher than those which foreign

buyers are required to pay for the exported products of these manufacturers has been regarded by many as an unjust practice. Evidence of such discrimination by manufacturers protected by tariff duties has frequently been cited in support of demands for a removal or a sharp reduction of the duties. In this dissolution suit such evidence appears to have been regarded by the prosecutor as something that tended to support the Government's case. We infer this from the character of the examination of Mr. Farrell. And yet, if Mr. Farrell has not been misinformed concerning the attitude of the commission toward this discrimination in freight rates, the company has simply been following the Government's example.

Clearly, it is now the duty of the Interstate Commerce Commission to tell the public whether it has approved or permitted such discrimination. If it has done this, and if it shall defend its course, any statement on this subject which it may make will not be overlooked in the approaching Senate debate on the tariff bill.

The Two Presidents of China

The break between Dr. Sun Yat-sen, the creator of the Chinese Republic, and Yuan Shi-kai, whom he chose and made Provisional President by his own resignation, is complete. The occasion for it we have told in another column. The acceptance by Yuan of the loan from the quintuple group, without parliamentary authority, he deeply resents, while the people are enraged at the murder of a leader opposed to Yuan. "The situation," says Dr. Sun, "has become so serious that the nation is on the verge of the most acute and dangerous crisis yet experienced." A civil war might result in the division of China into a northern and a southern republic; but we hardly expect war, because President Yuan has the army, and he will have the money, if the contract, which is all signed, is carried out by payment of the loan at 85 per cent on the face value. The southern provinces, which mostly support the opposition to Yuan, have neither army nor money.

There is every reason to congratulate President Wilson that he refused to allow our Government to back up the bankers in protection of this usurious loan. The tax on salt is pledged for the loan, and certain provincial taxes, which would be of no value if the southern provinces should set up for themselves on the very ground that the loan is unconstitutional. We have in the new republic an illustration of the truth, so notable of late in our own history, that the fact that a President selects his successor is no proof that they will remain friendly.

Railroads for Alaska

The Senate's Committee on Territories has taken much testimony about the proposed construction of railroads in Alaska by the Federal Government. Last week the series of hearings came to an end, and the committee will soon make a report concerning a pending bill, which appropriates $35,000,000 for the work. In Alaska there are now 466 miles of railroad, near the southern coast. A commission appointed by President Taft recommended, in an elaborate report, that 733 miles more be constructed by prolonging the present lines, if traffic agreements with them can be made. The enormous deposits of coal can be reached by building two branches, 76 miles in all, at a cost of less than $4,000,000. The extensions recommended would open for settlement great tracts of land in the river basins.

There should be legislation to promote the building of railroads, but at the same time Congress should open the great coal fields that are now locked up. The coal deposits are truly enormous. Estimates made by geological authorities are so large that they seem almost to be the products of a fertile imagination. The coal can be mined easily, and a considerable quantity is needed every year in the Territory. And yet only 40,000 tons have been mined and marketed, while 1,500,000 tons have been imported, at a cost of $12 or $15 a ton.

Probably, if the coal deposits should be unlocked, under a reasonable leasing and royalty system, private capital would build the two branch roads. Then the local demand for coal would be satisfied, at low cost, and large quantities would

be shipped to the Pacific Coast states. But private capital will not construct the longer roads to the lands of the interior. Freight rates high enough to earn 6 per cent on the investment would be prohibitive, and there would be no agricultural development. But the Government, it is said, would be satisfied with rates earning 3 per cent.

The proposed railroads to the lands of the river basins would undoubtedly cause the discovery of additional mineral deposits and the utilization of some whose existence is already known. The fact that more than $200,000,000 worth of minerals has been taken out of Alaska since we paid $7,000,000 for the Territory should have some weight. If the Government should build the proposed roads they might not be profitable for a year or two, but they would soon pay their way, with the help of suitable laws for the land and the coal. This is a case in which some of the arguments against Government ownership lose force. There will be no railroads to the interior unless the Government makes them. They might be operated by private capital, under lease, after a time. Eventually there would be ample direct and indirect return on the Government's investment. The roads should be built without delay, and Congress at the present session should unlock the coal deposits.

About Boosting

Chunky boys often ask to be boosted up an apple tree, and they often need it. When the apples are choice, we are rather glad that boosting is a necessity in order to get at them. Gravity is in such a case on the side of character, and boosting it is that breaks over one of Nature's best laws to save our Spitzenbergs. Two boys, however, are not so bad as when we have a whole gang to deal with, and that is what boy coalescence implies; it knows the power of getting up in the world by other people's efforts, whereas the lone individual squats on the sod and longingly looks up. There is, however, a principle involved here, and it is not so easy to decide between the boosters and the non-boosters.

Three boys being in sight, playing "Three-old-cat," we asked, "What would you do with a boy that wanted you to get his lesson for him?" The answer came promptly thru the window from Ned, "Why, sir, I'd set him down for a swindle"; and Jim as promptly answered, "I'd give him a boost to be sure; for a baby, sir!" but Tom answered, "I would ask him to get my lesson for me." Here are three ways of getting along in the world, but it leaves the problem unsolved, whether boosting is a substantial social principle, or whether it takes the real vim out of honest work.

When the writer was young he went to school with Grover Cleveland. Grover was round and solid, but enterprising. Naturally he had some difficulty in climbing apple trees, unless boosted. He was always generous, however, after he had reached the limb that held the Indian Rareripes. It needed only a slight jar to bring down a shower of these delicious apples, while Grover still retained enough to fill his pockets and himself; with all the rest he was a good shot with an apple, and he knew it. Somewhat later in life he wrote, "I see an apple, a big one; but I shall have some difficulty in getting it. Will you give me a boost?" While eating this apple he complained that it was not altogether without spots, and that these had a capacity for colic and a suggestion of bitterness.

President Wilson, you remember, met the booster at the outset, and objected to the absolute character of the custom. He did not propose to be flung into the Executive Mansion by the sheer strength of some President maker. This is hardly fair for Mr. Cleveland, however, for a more defiantly independent nature never wore a roundabout or occupied the President's chair; only there seems to be a drift in the political atmosphere toward this particular resolute readiness to sacrifice for independence; possibly it will constitute a new basis of political action. Offices are not so generally called plums; and to shake the tree, or to climb it, is more often a thankless job. Can you imagine no more boosting at Washington and the political system so recast that every Senator and Representative shall be free from rendering compensation for votes?

From Albany and elsewhere we hear the plaint that boosting is seriously in

danger as a principle. Governor Sulzer is stubborn on this matter, and to applicants replies that party has gone to rot. He served it for twenty years himself, waiting for a boost, which at last Tammany kindly gave him. Now he proposes to stand on his own feet, leaving others to do the same. This is all well enough after one has been elected Governor, but only one out of a bunch gets there. Is there a big struggle ahead between the booster principle and the stand-for-yourself principle; and is there not something favorable to be said for the boost and the booster; yes, and something favorable for the fellow that gets the boost?

Is this whole business of depending on a party as beggarly as depending on the charities? Is our political method injecting a pauper spirit into our whole official record? Senator Root, in two or three of his most capable speeches, has told us that our Government depends on parties; and substantially we know that to the victor have belonged the spoils. It looks as if a good deal of the opposition to tariffs depended on the fact that the tariff is at bottom a boosting force. It rapidly descended from honest protection of the weak to boosting the wealthy. In religious life matters went substantially the same way—praying degenerated easily into a whimsical effort to get boosted into righteousness by proxy.

Old habits, however, are hard to break, and look where we will, in state or church or school, the boosting business has a stout grip. Garfield notified us that we had got to the top of the old-soldier pension list; but that list is this year just a bit more than double what it was in Garfield's day. "Mothers' pensions" sounds well, but why not "fathers' pensions" and why not "big-family pensions"; and why not, yes, why not a boost all around? When it comes to that we have ideal Socialism; if Socialism will stand still long enough to endorse it.

Just think how many times in life one gets within a few feet of success. It only needs a kindly neighbor, some one who has a "pull"; or possibly a petition with a dozen spiritless names on it, and the thing is done. It may result in helping some one out of a pinch, and the creation of a well-to-do citizen; or a useless official is created and a decent laborer is spoiled. Perhaps the boosting system has got so snarled up that we mortals shall never be able to read the tally.

As it looks to us just now, there is mischief in going any farther in any direction with this boosting principle. It runs its fibers down into every channel of life, private as well as public. We would rather see the broad shoulders of finance so tapered down that nobody could stand on them to reach the plums of either office or wealth. Official national boosting, the more you study it, seems to be a paraphrase of national militarism. It is taking by taxation instead of by force from one person to help another, who in turn has to give up a share or a chance to those who aid him. There is no other fault to be found with Tammany than that it is a completely worked out boosting system. The New York police are so situated that the boosting principle becomes disreputable and finally desperately dangerous.

On the whole, can society be so organized as to leave the boosting principle out? Would it put an end to Christian charity and brotherly benevolence? Just where shall we fix the point that a young man must follow the advice of others and take the assistance of teachers, and just where must he rely upon self judgment? Most assuredly we are not educating the will sufficiently—perhaps it is the great fault of American education. The Declaration of Independence released us from the English people; do we need another declaration of independence from our own people? Can we sustain an American Government that is not substantially a boosting machine?

The Future of Mexico

Our Government will not recognize Huerta as President of Mexico. The fact that he murdered his predecessor and seized his power is reason enough for the refusal. It is a further fact that it is not worth while to recognize a ruler who is liable so soon to be overthrown. Or we may be asked before a great while to recognize the separation of Mexico into two republics. The northern states of Mexico are consolidating their power, are conquering the troops sent against them, but

do not seem disposed to make any attacks on the capital. Meanwhile the rebellion under Zapata in Southern Mexico is not quelled.

The northern states of Mexico, which lie against the United States border, have very little relations or sympathy with the southern states. They are more Americanized. They include an immense amount of capital and industry from this country, and they do not want revolution and disorder, but they do want peace and quiet labor. It would not be surprising if they should establish their own government and decide to set up for themselves. We believe they could not be overcome by any force that could be brought against them. Indeed, there is no such community of interest in southern Mexico which would allow much resistance. For a long time we may expect, rather, disorder if not dissolution.

We do not by any means say that if the northern states of Mexico should set up a national government for themselves they would ask to be admitted as states into our American union, but it is a contingency that must be considered, and which should not be unwelcome. It would be of some advantage to us, and would be of much more advantage to them. They now look across the line and see with us peace and prosperity, and they desire it. Or they may prefer the honor of being an independent, tho a small, nation. In either case they would have our benevolent sympathy.

The Second-Class Mail

For several months THE INDEPENDENT and other magazines have been getting complaints from subscribers, stating that they were not receiving their copies promptly. These complaints have mostly come from sections where the magazine had previously been delivered on Fridays or Saturdays, and the complaint has usually been that it is now often delivered on Mondays. Regions nearer or more remote have not yielded so many complaints, because subscribers do not so much mind if there are delays of a day when such delays do not deprive them of their Sunday reading.

These delays have been caused by the eight-hour day imposed upon postal employees by the last Congress, the great amount of extra work incident to the inauguration of the parcel post, and by the indifference to second-class mail bred among postal employees by the campaigns prosecuted against that class of mail during the preceding two administrations. Publishers have suffered severely, but have been quite helpless. Subscribers have complained, and the Post Office officials have been under the strain of continual criticism and appeal.

We are now glad to note that there is a measure of relief in sight, and our subscribers will be glad to know that the prospects for prompt delivery of periodicals are at least slightly improved. Congress has appropriated $600,000 to enable the Post Office Department to handle the mails more expeditiously.

This will ameliorate conditions for a time, but will not cure the trouble. There is some prospect that the eight-hour law for Government employees may be reconsidered by Congress. Even so, their compensation should be adequate, and there should be reserves of substitutes to be put on when occasion demands. But the basic principle controlling the handling of the mails should provide that all matter shall be handled without delay. Labor conditions should be adjusted to the needs of the service.

In Brief

A police recorder in New Jersey has authority to send a girl to prison, and that is what Recorder James F. Carroll did last week in the Paterson police court. Seven girls were arrested for obstructing and interfering with those who wished to work, and the Recorder gave each ten days in prison, except one who said, "Thank you, your Honor." The words were respectful enough, but the tone was not; and the Recorder must have been angry, for he answered, "You are welcome; sixty days." Not being under jurisdiction of that court, we venture to indulge sufficiently in contempt of his court to declare such an act outrageous, and that the Recorder deserves to be removed summarily.

The bigness of the British Empire appears in the list of Crown Colonies and Protectorates which, as Japan has just been told, are included in the treaty between Great Britain and Japan. They are: "Bahamas, Bermudas, Barbados, British Guiana, British Honduras, Cyprus, the

East African Protectorate, Falkland Islands, Federated Malay States, Gambia (including the Protectorate), Gold Coast Colony (Atlantic and Northern Territories included), Granada, Hongkong, Jamaica (Turks and Caicos Islands, and Cayman Island included), Leeward Islands, Malta, Mauritius, Northern Nigeria, the Nyassaland Protectorate, St. Helena, St. Lucia, St. Vincent, Seychelles Islands, Sierra Leone (the Protectorate included), the Somaliland Protectorate, Southern Nigeria (the Protectorate included), Trinidad and Tobago, and the Uganda Protectorate." But the treaty does not include Egypt, nor the self-governing Dominions, Canada, Australia and South Africa. They can shut out Japanese. India is otherwise included.

Our readers do not forget the great interest taken in the Korean conspiracy case. Hundreds were arrested on the charge of membership in a society which plotted to murder the Japanese Governor General, and over a hundred were convicted, most of them Christians, altho they declared that their confessions had been extorted by torture. On appeal all were acquitted but six, of whom one was a Korean prince educated in this country. Now the Supreme Court of Korea has nullified their conviction on the ground that the evidence charged only plotting and not actual preparation to accomplish the assassination, and they must have another trial. The general belief of foreigners is that the conviction was unjust.

We are glad to see the Southern Presbyterians strong for union. They hope to take in the United Presbyterians next year and they have voted not to withdraw from the Federal Council of Churches, and they propose that a Presbyterian Congress be formed, with two houses, to legislate for all the Presbyterian denominations in the country. It was the election of Professor Shailer Matthews as president of the Federal Council which led to the proposal to withdraw, as he was not considered orthodox enough.

We receive from the American Missionary Association the encouraging word that of the $300,000 needed by Fisk University $226,000 has been subscribed. The remaining $74,000 must be pledged by the end of this week in order to make binding the large amount already pledged. Fisk University is the leading institution for the education and Christianizing of the colored youth of the South, and it seems to be the duty of every patriotic citizen to help it as quickly as possible.

Our Chronicle is the magazine issued by the Christ Episcopal Church of Poughkeepsie, N. Y., and the rector and editor is Dr. A. G. Cummins. In the May number it says: "The Protestant Episcopal Church was the first Church on the ground in America." Oh, no. The Catholic Church was older by a century. It continues: "It was almost, if not quite, the largest in the colonial period. Today it is one of the richest and includes almost the greatest number of men of wealth, yet it is one of the smallest religious bodies in number in all this country." Oh, no, again. It is not one of the smallest; it has 900,000 communicants, and there are only a few larger. The Baptists, Methodists, Lutherans, Disciples and Lutherans—more than of the Congregationalists who came but twelve years later.

The testimony in the trial of the millowners on the charge of planting dynamite where it would be supposed to have been put by the strikers in the late disturbances at Lawrence, Mass., is very damaging and apparently conclusive. It is strengthened by the fact that one of the men specially active in the plot committed suicide, which was confession. It was a dastardly act, which quite defeats its purpose and gives sympathy to the strikers.

The Central Federated Union in this city can hardly expect the President to recall Ambassador Page from his post in London on the charge that he has been an enemy to union labor. The president has appointed others to posts where their strong union labor principles will have more chance for influence than the post of ambassador provides. Men holding views on either side should be eligible to office.

There is a National Democratic League of colored men, and Bishop Walters was their president, and their representative in seeking offices from the Democratic Administration. He has resigned. Few officials of his color are called for.

Mr. Roosevelt has done wisely in bringing suit for libel against the editor who accused him of habitual intoxication. He did not wish it to go down to posterity, as did the story that Daniel Webster often made speeches when drunk.

Secretary Daniels recommends, for the sake of economy, to create an armor plant for the Navy. That seems as legitimate as the possession of navy yards where ships of war can be built and repaired.

Of the eighty-five foreigners who are in Rome this year studying the Montessori schools, sixty are Americans.

American Beet-Sugar and the Tariff

The Effect of the Proposed Abolition of the Sugar Duty upon this Important Domestic Industry

By Roy E. Blakey, Ph.D.

[During the last twenty-five years the beet-sugar industry has been built up in the United States chiefly thru the efforts of agricultural experiment stations and by means of a large expenditure of public funds for bounties and research. Many portions of the arid West have been reclaimed and occupied by thriving communities entirely dependent upon the cultivation of the sugar beet. In our editorial of April 24 we exprest the apprehension that the tariff bill now before the Senate removing the duty on sugar would imperil the beet-sugar business of continental America as well as the cane-sugar business of our island territories in the Atlantic and Pacific. This view is confirmed by Dr. Blakey, of the Department of Economics in Cornell, who has made a special study of the question. His monograph on *The United States Beet-Sugar Industry and the Tariff* was published in 1912 as No. 119 of Vol. XVII of the Columbia University Studies in History, Economics and Public Law and contains a very complete bibliography of the subject, with page references to the various tariff hearings since 1893, the hearings of the Hardwick Committee appointed to investigate the American Sugar Refining Company (1911-12) and to the other official and trade literature.—EDITOR.]

The sugar and wool schedules have been called the "Bloody Angle" in the present tariff fight. Nor is the present contest in the Senate the first one in which the struggle has centered around these schedules. In fact, there are many features in the present situation which show striking parallels to those of 1894, when the Democrats last revised the tariff.

There is a similar unwieldy House majority, a narrow Senate majority, a Democratic President, a public demand for tariff revision, a radical bill sent from the House to the Senate, and an income tax rider to compensate for reduced customs duties. Particularly, now as then, there are proposed reductions upon sugar and wool which threaten to overturn the narrow majority of the Administration party in the Senate and thus to defeat the House bill.

The alleged combination between the Trust and Senators from Southern sugar states in 1894; the speculations in trust stock by certain "sugar Senators" while the bill was pending; the emasculation of the House bill by the Senate, and especially the victory of the Trust in retaining the differential protection which the House had denied it, were all notorious at the time and the recollection of them has long haunted the efforts of Democratic statesmen.

But notwithstanding the remarkable resemblances between the present situation and that of 1894, there are differences and contrasts even more important; differences in both political and economic situations; in the interests lobbying before Congress in the importance of domestic industries, and in American consumption and sources of supply. Limits of space forbid mentioning the many great political changes of the last twenty years, but the recent constitutional amendments are two evidences of their trend and fundamental importance. Underlying industrial and economic conditions have changed no less. For two centuries of colonial existence and for over a hundred years of national growth the vigorous child of the New World had been engaged in conquering the empire that lay before him. Vast areas and untold natural resources were to be had for the taking. With such rich opportunities at his door, what cared this lusty youth for world affairs? But, by the end of the last century, he had finally circled his own vast domains and was ready to look beyond its confines; to step from his sphere of unconcern, of western isolation, into the field of world politics and into the scramble for world markets. The Spanish-American War may be considered a mere coincidence of itself, but it marked the beginning of a new epoch.

The passing of the vast and fertile American frontier is not the only large factor bringing about the recent radical changes. Large scale operations and combinations, still in their infancy in the early nineties, have since developed into huge proportions. An unexampled series of large crops has failed to maintain the relative supremacy of our agri-

culture. The exports of our manufactures and not those of our agriculture are now rapidly increasing and invading the markets of the world. In the last two decades our urban and industrial population has increased 40 per cent, while our rural population has remained almost stationary. The transition from extensive to intensive agriculture which is just beginning must continue; in fact, it must grow apace. It is the relation of the domestic beet-sugar industry to this transition and the effect that the adoption of the pending sugar tariff would have to which we wish to call especial attention.

Continental Europe and particularly Germany, where the beet-sugar industry has reached its largest and highest development, has long since passed the experimental stage. It has accepted as final the fact that beet-sugar production is an almost indispensable part of its intensive system of agriculture. Scientific investigations covering thousands of acres and scores of years have demonstrated beyond doubt that beet culture increases substantially the yields of cereals and other crops following in a rotation series, these increases not unusually amounting to 20 or 30 per cent. These larger yields are due more to the putting of the soil in good physical condition, which the deep plowing and thoro cultivation accompanying beet culture necessitate, rather than to the addition of fertilizing elements.

Sugar beets take about as much fertility from the soil as corn, but the sugar itself is entirely a product of sun and air, so that if all the by-products of manufacture are returned to the fields, no fertility is removed. American growers have not paid as much attention to this matter as yet as have those of Europe. However, the tops are frequently left or fed on the fields, and, in many instances, the pulp is returned from the factories and it also is fed so as to return it to the soil.

It has taken Europe just a century to develop the industry to its present high state. Nearly all of the improvements have been originated as a result of or have been stimulated by a skilfully devised system of internal taxes and customs duties which, while furnishing a revenue, have been laid in such a way as to enable a partial evasion of taxes by improvements in the quality of the beets and in the process of manufacture. As a result, scientific experiments have played a vast role in this development, and the average sugar content of the formerly unknown beet increased from 5 per cent at the beginning of the century to 16 or 18 per cent at the present time.

American producers have taken advantage of European experience and, in a few small sections, notably in California, have equaled the better results of Europe. But, on the average, Germany's beets are richer and her yields larger than ours, so that she gets 50 per cent more sugar from an acre than we do. With the exception of sporadic and unsuccessful attempts, we had no beet-sugar industry until about 1890, and the present industry may be said, practically, to have taken its rise from the passage of the Dingley act in 1897.

To the present time, we have depended almost entirely upon European seed, which is not well adapted to such varied sections as humid Michigan, high and arid Colorado, and subtropical California. We are just beginning the production and adaptation of home-grown seed, an effort which will take considerable time for ultimate success.

Farmers are naturally conservative and do not turn readily from their crops and extensive culture methods of a lifetime to others radically different. There is no small initial difficulty in securing a sufficient acreage within an economical hauling and shipping radius to justify the erection of a sugar factory large enough to meet competitive conditions. Furthermore it usually takes a new factory, and still more a new community, some time to get upon an efficient, or, at least, upon the most efficient producing basis. Thus it takes several years in any one community and many more years in the country as a whole for such an industry to become properly adjusted. In this respect such industries, which are based largely upon agriculture, are radically different from the purely manufacturing industrials which are at no special disadvantage as regards raw materials.

It has been said that every beet-sugar

factory is a sort of agricultural college. Each of them has a corps of agriculturalists who spend most of the growing season in the fields of the farmers, advising them as to cultural methods, as to crop rotations, and incidentally as to many other crops and problems upon which the farmers want information. This service greatly improves and stimulates the agricultural efficiency of nearly every community it enters. Its value can hardly be estimated, but its importance is beginning to be recognized thruout the United States, as is evidenced by the recent movement for expert county agriculturists. This is only the beginning of an adoption of European intensive methods.

The domestic beet-sugar industry has made reasonable improvements in quality of beets and yield of sugar per acre, in manufacturing processes and in utilization of by-products, but it has only begun upon a comprehensive scale. Scientific crop rotation is scarcely appreciated as yet, even in the beet growing sections, and the value of beet culture in this connection is not even dreamed of in the greater part of the United States. Since 1897 the growth in number of factories and output has been phenomenal. In 1889-90 (McKinley tariff) we had two factories with an output of 2203 long tons of granulated sugar; in 1893-94 (Wilson tariff), six factories with an output of 19,550 tons; 1896-97 (Dingley tariff), seven factories with an output of 37,536 tons; in 1912-13, seventy-three factories with an output of 624,024 tons. These factories are now scattered thruout sixteen states in the West and Northwest, with the largest centers in Colorado, California, Utah, Idaho and Michigan.

The present output is about 15 per cent of the entire consumption of the United States. The Department of Agriculture estimates that we have more than four hundred times as large an acreage adapted to beet culture as is now devoted to it. Beets are best adapted to those parts of the United States in which corn cannot be grown very successfully. They thus afford the opportunity for a thoro stirring of the soil thruout the growing season. This is very neecssary in the case of most lands, especially after they have been long continued under small grains and grasses. Furthermore, beets are adapted to many parts of the West where the expense of irrigation is prohibitive for the usual extreme system of extensive agriculture.

As mentioned above, within our short experience we have been able to produce beets equal to the best of Europe in a few sections, tho perhaps not quite so cheaply, but more cheaply than the average of Europe. Our average results, both as regards quality of beets and cheapness of sugar, are better than those of some European countries. They are about equal to the results of France, but they are surpassed considerably by those of Germany.

Average costs of producing beet sugar in the United States today, eliminating a few very uneconomical plants, are about 3 to 3½ cents per pound of granulated sugar. German costs are approximately ¾ of a cent less, the difference being due to the smaller costs for richer beets. The principal reason for the smaller cost of German beets is that so large a part of the expense of beet growing is for unskilled hand labor. This amounts to 50 to 85 per cent of the total cost of producing beets. Hence the great difference in the two countries as regards wages for such help makes the labor cost per unit here comparatively high. This is not the case in the manufacturing phase of this, or of most other industries where the labor cost is only a small proportion of the entire expense and where American advantages as regards machinery, large-scale production and efficient management more than offset the high daily wage. On the average, the sugar in the beet costs our manufacturers 2 to 2½ cents per pound—nearly as much as the finished product costs German manufacturers.

But the greatest present competitor of domestic beet sugar is not German beet sugar, as it once was, but Cuban cane sugar. The modern plantations and mills of that island can produce more cheaply than those of Germany by approximately a quarter of a cent per pound. Before the Spanish-American War, the United States imported considerable quantities of sugar from Germany and continued to do so even until

some time after the 20 per cent concession to Cuba (December 27, 1903). At that time Cuba's output was about 1,000,000 long tons of sugar. Now it is 2,250,000 tons. Cuba now has more than enough sugar to supply all of our needs for foreign sugar; she has crowded Germany out of our markets and is threatening to press her in the English market, the world's only great outlet for surplus sugars. If United States markets are thrown open to her free of duty, it will be easier for her producers to meet American producers here than to meet German producers in England.

Cuba is wonderfully adapted to sugar production as regards soil, climate and location. American and European capital is just beginning a large-scale modernization of her mills, plantations and systems of transportation. She now furnishes half of the United States sugar consumption, and her recent developments, taken in connection with the fact that most of her sugar lands have not yet been put to sugar, indicate the immense possibilities of her future growth. The recent developments in other tropical cane countries point to the same conclusion. Porto Rico has increased her output thirteen fold in the last thirteen years; Hawaii made similarly rapid strides; Java under the Dutch and Formosa under the Japanese have shown like responses to stimulation. American exploitation in Cuba under the stimulus of permanent free entry to our markets after three years, as is proposed in the pending tariff bill, can scarcely fail to wipe out most of our domestic beet-sugar industry before it shall have time to become thoroly adjusted and before the importance of its relation to our agricultural and industrial transition is realized.

Not all of the existing plants may be expected to shut down suddenly. Their owners will endeavor to get as much salvage from the wreck as possible. Perhaps many of them will hope and work for a change in political policy and, at any rate, Cuban producers will not double their output over night. Unusually favorable conditions and high inland freights may enable even a few factories to survive permanently, tho Cuba has a cheaper delivery cost to the larger part of the population of the United States than have most of the domestic beet-sugar factories.

The Louisiana sugar industry is upon a less substantial basis than the domestic beet sugar industry, hence less of it can survive early and permanent free sugar. Porto Rico is more fortunately situated, tho it will suffer considerably. The Philippine development has not gone far enough so that vested interests will be affected very much. The scaling of values and the probability of financial and industrial ruin will be much more widespread and serious in Hawaii than anywhere else, because it depends almost entirely upon this single industry, already highly developed.

In 1894, the only large sea-coast refiner, the Trust, was lobbying for a differential protection upon refined sugar. It then cared little about the duty upon raw sugar. At present, the Trust refines less than half our sugar and less than half the proportion it refined in 1894. The present tariff affords only 7½ cents per 100 pounds differential protection to domestic refiners, while the pending bill offers none. None of the refiners are offering any serious objection to this cut, for they know such objection would be useless. Hence today, instead of refiners asking for protection, they are asking for a reduction on raw sugar so as to decrease prices and increase business thru larger consumption.

The Trust admits an ownership of about one-seventh of the entire capital stock of the domestic beet-sugar plants. This may control as much as one-third of their total output. Hence the Trust stands to lose on this interest and at the same time to gain on its refining interests if the tariff is removed. Before the Ways and Means Committee it recently favored some reduction, but opposed free sugar.

Most of the activity of the present campaign for free sugar, at least so far as it has gotten into the public light, has been financed and managed by the Federal Sugar Refining Company, of New York, and has been opposed most actively by the organized beet-sugar manufacturers. The pending bill, if adopted, will probably injure the Sugar Trust somewhat, but not as most people seem

to think. It will also reduce the cost of living a little, but in this case, too, less than is generally supposed. At the highest estimate, not more than $1.50 per capita yearly.

It is not a question of whether the present high sugar tariff should be reduced, but a question of the wisdom of the rapidity of the proposed reductions. If the domestic beet-sugar industry, or any other industry for that matter, cannot ultimately stand upon its own feet, or cannot repay the nation for the initial subsidies granted it, it should be given up as an unprofitable experiment.

If present direct costs are to be compared with those in Cuba, and if the balance is to be struck now entirely upon that basis, no doubt the domestic industry is unprofitable. It is also possible that we have undertaken the present experiment before its proper time and that riper conditions later will assure more rapid success. But the phenomenal successes which we have already achieved in such a short time; the extensive plant we now possess, which may be used as a basis for more comprehensive experiments; the possible improvements, some of which are being made every year; the great indirect benefits which are only beginning to be appreciated, and the relation of the industry to our national economy seem to indicate that it would be unwise to scrap our plants suddenly and to throw away our efforts at one fell swoop.

This result, in addition to the scaling of values in our other sugar fields, both continental and insular, seems more severe than would be justified by any offsetting advantages that would be obtained by adopting the pending bill. It is probable that the proposal to reduce the duties immediately by 25 per cent would not be over radical, but the facts that have been cited do not seem to justify a removal of all duties within three years. It appears that a wiser course would be the adoption of an annual reduction extending the entire removal over a period of, say, eight or ten years.

It is not to be expected that the present fight in the Senate will have the same issue as that of 1894. Nor, whatever the outcome, is it at all probable that the result will be accompanied by the unhappy events of that ill-fated period. However, tho the present Democratic administration is no more responsible than was that of 1894 for the sins of its predecessors, nor for the weather and the crops, nevertheless, it cannot well afford to ignore the real economic and political effects of its actions nor to be entirely unmindful of the philosophy of the average voter; *post hoc, ergo propter hoc.*

God's Neighbor

By Katharine J. D. Fletcher

God's neighbor thou, our high and dauntless flag,
Whose westering splendor leaps from crag to crag;
How thy swift stripes in a red rhythm run,
Along the sky, across the glorious sun!
Like strings of lutes they quiver as they shine,
And make a silent music, sweet, divine—
A music understood without the ear,
Whose very silence signals, "God is here;
God here His palace keeps; His neighbor I;
Together share we watch, in His deep sky;
Nightly His stars He mingles with mine own,
And when His cease from shining, mine shine on!"

Montreal, Canada.

The Failure of Smith

The Church is Not the Only Thing the Average Man Neglects

By Charles E. Hesselgrave, Ph.D.

[Even a worm will turn in time. Even ministers get tired at length of being blamed for the failure of the average man to take an active interest in Church work. The question must have arisen in many a ministerial mind whether the middle class American was doing his duty in his other social relations, whether in fact he was not as much of a failure in the fields of politics, family life, and commerce as he is in religion. Such suspicions, tho often felt, are rarely voiced, so we are glad that the Rev. Dr. Hesselgrave has had the courage to state frankly and emphatically as he does the growing feeling of dissatisfaction with a class which is so serenely satisfied with itself.—EDITOR.]

Ever since Mr. Nicholson wrote for the *Atlantic* his deft apologia for Smith's absence from church, the official representatives of religion have developed a remarkable anxiety over Smith's case. His religious pulse and temperature have been taken again and again. "Councils" and "consultations" of theological doctors have been duly called to consider his symptoms, but they failed to pronounce convincingly in regard to Smith's malady or to prescribe an efficacious remedy. Some of Smith's zealous clerical friends have tendered him sympathy and comfort, while others have roundly denounced him for his carelessness and obstinacy. Many have advised a course of treatment in self-denial and reform, and several have offered him their honeyed words as a kind of Christian Science cure-all. Editorials, leading articles, sermons and addresses in endless variety have commented on Smith's critical condition and pleaded with him for the sake of religion and country not to endanger his own salvation by his ominous neglect of the Church. At last we have reached the stage where Smith's case is dignified by exploitation in a book,* and the reading public is asked to interest itself in the restoration of the prodigal to sound religious health and the fold of the Church.

Smith has been pretty accurately described as "the best of fellows," "an average twentieth-century American," "in no wise antagonistic to religion," "merely indifferent," one who "spends his Sunday mornings golfing, or puttering about his garden, or in his club or office" instead of attending divine service; or, for sake of variety, he now and again takes to his "motor for a flight countryward." These hints sufficiently characterize the conventional, indifferent, well-to-do Smith, who is put forward as "worthy of the Church's best consideration," and whose soul, we are told, "is still worth saving." Whether these last statements are true or not I am unable to decide, but I would in no wise discourage those who believe they are, and who, because of this belief, persist in sincere and devoted missionary efforts for the reclamation of Smith's soul. I submit, however, that at any rate his soul is the only thing about Smith worth saving, and I protest against the repeated implication that, barring his delinquency in Church affairs, he is to be cherished and looked up to as a pillar of social strength and a forceful factor in human progress. For, in all truth, it must be said that whatever may have been Smith's past virtues, and we freely admit that formerly he had some, his present value to society has well nigh reached the vanishing point. To seek his salvation on the ground of his ability and resourcefulness, and in view of his future usefulness, is somewhat amusing if not positively ludicrous to those who are well acquainted with the family. Both his critics and his sponsors have fallen into the curious error that Smith's effectiveness in other lines than religion is of a high order. But the patent fact is that his religious deterioration is paralleled by his flat and ignominious failure in every other social task, and only his valuable inheritance and squatter claims upon the resources of others save him from open bankruptcy and ruin. Certain it is that from the standpoint of social values this golf-playing, automobile-riding, pleasure-loving Smith, who prefers his club and cigar to active

* *Smith and the Church.* By Rev. Harry H. Beattys. With an Introduction by Meredith Nicholson. New York: Frederick A. Stokes Company, 60 cents.

participation in Church work, has slowly and irrecoverably petered out, and all the glamor of past efficiency and present humbug cannot avail to obscure this pertinent fact in the minds of thinking people. The utter failure and breakdown on the part of Smith is lamentable or laughable, according as you take him seriously or view him as a self-centered parasitic growth, an excrescence on the body of society.

In the first place every keen observer is well aware that Smith is a political failure. The time was when he and his circle created public opinion, whipt the common people into line, and made kings tremble on their thrones. Government was once largely in the hands of Smith, and yielded pliantly to his inflexible will. But little by little "the poor of the land," in order to secure other privileges, have wrested from Smith their fair share in governmental activities, and thru incessant struggle have raised themselves to political equality with him —an achievement of the ideal which Smith always professed to have but never seemed anxious to embody in reality. But what is the present status of Smith's political inheritance and his boasted efforts for the common weal? There can be no mistaking the situation. Smith's preoccupation in pleasure, his assumption of superior airs and wisdom, his overreaching greed of gain, and his constant neglect of duty have conspired to bring his whole system into discredit by throwing the balance of power into the hands of political freebooters. In due time the people have become aroused to find that Smith has weakly deserted the common cause thru the lure of gold or the stress of some dominating personality, or worse yet, has degenerated into an indifferent upholder of outworn forms. Smith is altogether too busy to look any longer after the formation of political opinion outside of the congenial atmosphere of his own club. His share of service in political life is usually done when he supplies his friend, the "heeler," with funds to round up the voters in the interests of his own selfish gain. To be sure, he occasionally sends "down" messages about his "opinions," which are made lurid with threats or forebodings of evil. When he desires to make a specially strong "hit," he points with ominous words to the dark cloud of rising socialism. On election day, however, Smith goes off fishing or hunting. His health demands it. However severe their public denunciation of the "suffragets," it is safe to say that Smith and his friends are secretly quite agreeable to the extension of the franchise to women, and look forward with satisfaction to the time when their burdensome political "cares" may be passed over to their female relatives. So far as her own family is concerned, poor Mrs. Smith will soon have to carry the real burden of politics as well as that of the Church. It cannot be denied that as a political factor Smith himself has already become a negligible quantity. Few there be at this late day who are influenced by him or his opinions, or stop to consider him at all, except to execrate him now and again for the astounding failure he has made and the tangle into which his lapse from duty has brought our political life.

Nor does Smith appear in any better light when viewed from the standpoint of economics and industry. His failure here is more or less complicated with his political collapse. Not long ago Smith received the priceless heritage of a well-developed competitive economic system, the rigors of which were toned down by personal contact and human sympathy. Soon after unlimited material resources were made subject to him by the advancing power of science and invention. To his keeping were intrusted the destinies of the economic institutions built up thru centuries of trial and struggle, during which a great legal system had been evolved to protect the common man and guarantee to the producer the right to enjoy and dispose of the fruits of his toil. The world had never known a period so fraught with possibilities as that which Smith wholly dominated in the plenitude of his power. The return for one's labor had never been so great, the incentives to toil never so many and diverse. If one desires to know how Smith has discharged the high responsibilities of his tremendous task and opportunity, he has but to look around him for the answer. Behold what desolation a few short years have wrought! Greed of gain and lust for power were too much for

Smith. He could not resist the temptation when the road to evil was so broad and the descent so easy. One can only view with shame the record of unfaithfulness to a great trust which resulted in the wrecking of so many ideals. Unmoved by any appeal except to selfishness, Smith has seen competition perverted into an instrument of torture and war, a legal system corrupted in the interests of injustice and oppression, the slaughter of innocents that their elder brethren might have the inheritance, wastefulness without precedent and poverty beyond description, luxury unlimited drawing its resources from hunger and want, brutal strength pressing into service and even slavery the weak and defenseless. We welcome the end of such a chain of horrors, even tho it come thru the application of the law of the survival of the fittest, and regard with complacence the final crushing of Smith's system between the mammoth trusts and the world-wide labor organizations. But what a destructive economic and industrial failure lies at Smith's door! Natural resources squandered, the strength of individual initiative in the great mass of workers sapped away, a vicious habit of luxury established among the few, and a bitter class strife engendered, all due to Smith's sordid indifference to ethical values, his worship of the golden calf, and his adherence to the spirit of his favorite motto: "After me the flood."

Again Smith is notorious as a eugenic failure. He is accustomed to point with some pride to the excellent stock from which he is descended. He displays his family tree on every available occasion. Its roots sink into the virgin soil of pioneer days, and no pretense is made to cover up the fact that it early drew its strength from buccaneers and knights of adventure. From its trunk there run out sturdy branches that show the vigor and virility of the past, when the living organism was waging a successful struggle with the elements of its environment. But when we fix our attention upon Smith himself we find that he represents the last lone twig upon the tree, so many times removed from the original stem that the vital sap has almost failed to reach him. In very truth the old tree is all but dead. Decay is evident in every part. It will never again stand against the winds of adversity or the storms of revolutionary passion. The home and family life based upon monogamy have formed Smith's cherished institution for culture and restraint. But his constant sowing of "wild oats" and his utter neglect of reform in the marriage relationship, except by the perverted method of divorce, have weakened the very foundations of family integrity and destroyed a large part of its moral and social influence. In the days before the automobile and the luxury of club life a vigorous band of boys and girls went out from the Smith household in every generation to inspire and direct public life and racial progress. But today the offspring of Smith's loins are few and feeble. Many are the reprimands he has received for evading the injunction to "multiply and replenish the earth," but the more acute observers are well content that the Smith progeny should thus dwindle in number, since the quality is decidedly inferior. Already society is overtaxed with the care and cost of rearing these spindling specimens of humanity whose pampered delicacy is developed at the expense of racial resourcefulness and social betterment. They have neither the ability nor moral purpose to make even a partial return for their unlimited luxuries. They cannot stand the rigor of an educational system which subjects them to the same disciplines as those adapted to the more vigorous children of the laboring classes, and they lack the initiative and force necessary to any kind of leadership in the world of affairs. No amount of protection or coddling can make them other than social dependents. There is positively no hope for Smith from the standpoint of eugenics. So far as the race is concerned he is not worth saving. On the contrary, the world will be better off without him and his weakling brood to provide for.

One cannot refrain from feeling that Smith's failure in these lines is all the more reprehensible because he and his forebears made or adapted the systems involved to suit themselves. It was the Smith family who devised and erected the churches their scion now refuses to attend. It was out of consideration for their esthetic taste that stained glass

and stone have been required to give religious edifices their repellent, dark and cold appearance. They constructed the ship of state which the present-day Smith has abandoned to wind and wave. It was their economic theory of independence which gave Smith his wealth and influence, which theory he now in cold indifference sees swept away as with a flood. Even the traditions of home were made to nourish the family tree to which in its decadent state Smith still ardently clings.

There can be but one explanation of this many-sided failure of Smith, and that is that fundamentally he is a moral and psychic failure. He has lost the priceless treasure which we call will power. The connection between ideal and action is irretrievably broken by the disintegration of Smith's personality. He is a moral weakling. The weapons of progress and reform which his fathers wielded with such effect have fallen one by one from his nerveless grasp. He knows what is good but can do nothing to realize it. He is even "anxious to vote for what he believes to be the best interests of the country," but he cannot stem the currents of pleasure to reach the polls. He properly inveighs against the waste in the Church, which closes its costly interior to the indifferent public so large a part of each week, yet the house in which Smith himself lives, containing twenty-eight rooms, including six baths, for the accommodation of the master and his wife, is closed for half of each year, while almost within sight of his mansion, as the owner well knows, three families, each with children, live the year around in a cottage of five rooms. Only yesterday Smith was returning alone in his auto from a little excursion for his health. As he passed a widowed toiler from the silk mill, trudging with weary feet the mile and a quarter to her humble home, his conscience smote him and he said within himself, "After her nine hours toil, it is she who should be riding and I walking." He thought to stop and take her in, but he did not. He could not raise his courage to the point. His grip on moral issues and actions is gone. He wishes but hesitates. He knows that destruction is sure to come to such a system of inequity and iniquity as that which gives him his special privileges. He would like to make a change, but his will is flabby and his "nerve" is gone. Ethical impulse dies before it issues in practical accomplishment. In thought he is ever on the verge of taking things in hand, but his pleasures and his profits have destroyed his moral fiber. So he drifts toward the cataract, diverting his mind with talk about the duty of the Church, the happy days of yore, and the danger of the rising social democracy.

There is no help for Smith. He is a colossal failure and must go. His house will soon be left desolate. He has fallen to rise no more. Some of his confrères in anxious pity seem to think that a religious injection will revitalize him and give him power to hold his place. This is the remedy of last resort and is no doubt well intentioned, but it is destined to end in nothing. It comes too late. Smith's trouble is not mere heart failure, but a general breakdown of all the tissues and functions of personality. His days are numbered. The marks of decadence deform his once comely appearance. His usefulness is past, and his continued presence among us is due to the fact that the processes of nature are slow, and social development drops its worn out sections piece by piece in order that no harm may come to the living organism. Soon we shall give Smith decent interment, enshrine his good deeds in the school history, and thank God that he no longer diverts social forces from their normal course of development, and that the nightmare of his physical presence has passed away forever. "And may the Lord have mercy upon his soul."

Chatham, N. J.

The Election of the Irish Parliament

A Novel and Ingenious, Tho Complicated, Form of Proportional Representation Is to Be Introduced

By J. Salwyn Schapiro, Ph.D.

A great historic process will be consummated when the House of Commons passes for the third time the Home Rule bill, establishing local self-government in Ireland. At last after a century of agitation, varying in method from poetic exhortation to assassination and revolt, English statesmanship is rectifying its great error of treating Ireland as the step-child of the British Empire.

The new Irish constitution provides for a Parliament of two houses, a House of Commons composed of 164 members and a Senate of 40 members. The former are to be chosen by the same electors who are now qualified to vote for representatives to the British House of Commons; the Senators, however, are to be nominated by the Lord Lieutenant, an appointee of the Crown, for the first five years. At the close of this period, they are to be popularly elected on the basis of proportional representation; 14 from Ulster, 11 from Leinster, 9 from Munster and 6 from Connaught.

New ideas gain a readier acceptance when a new order of things is to be established; for then the conservatively minded have no cherished traditions to preserve and no age-old system to defend. For years, advocates of proportional representation have been denouncing the absurdity and injustice of our so-called majority system; but they were regarded as faddists and cranks, and their ideas received scant attention. Now, not only is the Irish Senate to be elected by proportional representation, but the wedge of the new idea has been driven into the elections for the popular chamber as well. On January 7 last, the House of Commons passed the following amendment to the Home Rule bill: "In any constituency which returns three or more members, the election shall be held on the principle of proportional representation and each elector shall have one transferable vote." This amendment, which passed by an almost unanimous vote (311 to 31), will have the effect of introducing this new electoral method in the selection of 31 out of the 164 members of the future Irish House of Commons. Ireland, whose condition in the past has been that of political helotage, is now to be given a parliamentary system replete with the most modern devices, and which, in time, may become a precedent for the reform of the British Parliament itself. Poetic justice sometimes happens even in politics.

Curiously enough, the leaders of all the parties, tho voting for the amendment, openly and frankly declared their opposition to the principle of proportional representation; even Mr. John Redmond, leader of the Irish Nationalists, and Mr. J. Ramsay McDonald, of the Labor party, both representing minority factions, distinctly repudiated the new idea. Prime Minister Asquith did indeed say that he was open-minded and willing to experiment, but was not a "disciple of the creed." Then, why did they all vote for it? The answer is that Ireland's peculiar social organization demanded a new electoral policy; and like good English statesmen they were perfectly willing to inaugurate a system which harmonized more with conditions than with their principles.

The peculiar situation in Ireland is this: not only is the country sharply divided into racial and religious camps, but—often overlooked in the heated discussions about Catholicism and Protestantism — there exists an even more fundamental antagonism, economic in character, between the urban and rural population. Moreover, no part is *all* Catholic or *all* Protestant; important minorities are frequently submerged in the majorities. For example, Ulster, which contains 891,000 Protestants, also numbers 691,000 Catholics; Leinster has 990,000 Catholics and 172,000

Protestants. In the same way, the 1,165,000 people who live in towns are almost engulfed in a peasantry numbering 2,755,000. The "majority system" of voting is peculiarly ill fitted to solve the problem of representation in Ireland, for the minority, under these conditions, would be almost totally disfranchised. Mr. Asquith declared that the "majority system" would "produce in these places a solid homogeneous representation on the part of the majority, and the minority, however large it might be and however deserving of representation, would not, to use a vulgar expression, have 'a look in,' and certainly would not be able to return a member." It was thought that the sense of injustice felt by a bellicose minority, left voiceless under "majority rule," would aggravate the already too bitter feeling now existing in Ireland. Proportional representation would mollify the minority by giving it just representation; at the same time it would have the effect of checking any tendencies that the majority might show to misuse its power.

According to the amendment, the system to be applied is known as the "one transferable vote" which was first suggested by Thomas Hare in his book, *The Election of Representatives*, published in 1857. Hare's scheme was strongly endorsed by John Stuart Mill, who is the intellectual father of many electoral reforms that are advocated at the present time. "This great discovery," he wrote in his Autobiography, "for it is no less, in the political art, inspired me, as I believe it has inspired all thoughtful persons who have adopted it, with new and more sanguine hopes respecting the prospects of human society." It has already been adopted in Denmark, Union of South Africa and Tasmania; in England, it is strongly advocated by such distinguished men as Baron Avebury and Lord Courtney of Penwith.

The method as explained by J. H. Humphreys in *Proportional Representation* provides for an election on a general ticket by an enlarged constituency. The elector has only *one* vote which he may transfer from one candidate to another according to his choice. At the polls he is given a list containing the names of the candidates, arranged in alphabetical order; the voter then writes the figures 1, 2, 3, etc., in front of the names to show his order of preference. If a candidate gets more votes at first choice than the "quota" necessary to elect him, his surplus votes are transferred to the candidate marked as the second choice. The "quota" is found by dividing the total number of votes cast by one more than the number of vacancies to be filled and then adding one. For example, let us say that in the city of Dublin, which is entitled to 3 seats, 20,000 votes have been cast; the "quota" is then (20,000 ÷ 4+1) 5001. Of the six candidates in the field, A, B and C are Nationalists and D, E and F are Unionists; the vote in the supposed election was viz:

A	is	marked	I	on 6000	ballots
B	"	"	I	" 4900	"
C	"	"	I	" 2500	"
D	"	"	I	" 5500	"
E	"	"	I	" 600	"
F	"	"	I	" 500	"

A and D having received more votes than the required "quota" are declared elected. The problem now is to assign the remaining seat, which is done in the following manner. A, having gotten 6000 votes, has (6000—5001) 999 surplus. Of A's supporters, let us say 5000 have indicated B as their second choice and 1000 C. To B and C must now be transferred a number of votes, bearing the same proportion to the number of surplus ballots (999) as the number of A's supporters who marked them as second choice bears to A's total vote, thus:

$$\text{To B are transferred } 5000 \times \frac{999}{6000} = 832 \text{ votes.}$$

$$\text{" C " " } 1000 \times \frac{999}{6000} = 167 \text{ " .}$$

Hence we get:

B 4900 + 832 = 5732
C 2500 + 167 = 2667

B, now having more than the required "quota," is declared elected. The delegation from Dublin to the Irish Parliament will then be A and B, Nationalists, and D, Unionist.

This system has just one advantage: it makes the part of the elector simple. But for the election officer it is fearfully involved and hopelessly complicated. The example given above is a very simple one, and perhaps not typical of an actual

election. To get a fair apportionment of seats under the "one transferable vote" method would require the services of a board of expert mathematicians. Just why the English have adopted this system is hard to say; perhaps because it is English in origin and so appeals to the Englishman's well-known disinclination to learn from foreigners in matters political. The Belgian and French systems, while sufficiently complicated, are, nevertheless, quite easy of application compared to this one.

The principle of proportional representation is in itself very simple and can be simply applied, provided there is an honest and intelligent desire to do so. Often, however, political parties, seeking special advantages, deliberately complicate the system to suit their own interests. In Belgium, the "d'Hondt method" was especially designed to favor the largest or Catholic party. For all that, proportional representation, even in its most complicated forms, does make an effort to create electoral machinery which is scientific and fair, and so do away with minority government that masquerades under the plausible title of "majority rule." As Mr. Augustine Birrell very well said in a speech favoring the new method, "Proportional representation has occupied the minds of intelligent people for a very long time, and here was a very good opportunity to give intelligence a fair chance."

Darkest New Jersey

How the Paterson Strike Looks to One in the Thick of the Conflict

By Leo Mannheimer

[Rabbi Mannheimer was for five years the minister of the foremost Jewish congregation of Paterson and has been active in civic matters, serving as a member of the Board of Education and as president of the City Club. His efforts to bring about a settlement of the silk strike so offended certain members of his congregation that it recently voted to dispense with his services. At our request he has presented his views of the strike and the conditions of the mills and the workers in them. We must not be understood as endorsing all of his statements and opinions and we refer the reader to editorial comment in this issue.—EDITOR.]

A three months' strike in the silk industry has attracted the attention of the people of the United States. Paterson has not enjoyed the most enviable reputation, nor has New Jersey prior to the time of Woodrow Wilson as Governor been a synonym for economic and social justice. Perhaps the change brought about by Governor Wilson was too sudden, the conversion too rapid. At any rate, when he went to Washington, there came a pause in progress. The old political bosses sought to regain their power. Jury reform had long been a necessity, never more so than now, when industrial warfare is disrupting society in various portions of the state.

The strike in the Paterson silk mills and dye-houses has been carried on under the leadership of the Industrial Workers of the World. The principles of this organization are distinctly hostile to the present social order. These principles distinctly play no part in the present strike of the 25,000 people, about one-third of whom belong to this organization. They are members of the I. W. W. because this organization offered them leadership, and because all forms of labor organization had been discountenanced and successfully opposed by the employers. I hold no brief for the I. W. W. I abhor a number of its teachings and principles. But I cannot refrain from paying tribute to the leadership and generalship of William Haywood, Elizabeth Gurley Flynn, Patrick Quinlan, Adolf Lessig and Carlo Tresca. For thirteen weeks they have held in check and directed an army of 25,000 men and women. Had they been preaching anarchism and violence there would have been anarchism and violence. But the record of this strike is a remarkable one. Between twelve and thirteen hundred pickets, male and female, have been arrested and jailed. Not one had a weapon. They were arrested and jailed

for "unlawful assemblage," for "disorderly conduct" and for other vague charges. A police force of 150 could hardly have coped with an army of 25,000 people if that army intended to make war.

There has been only one death as a result of the strike. A stray bullet from a detective's pistol struck a striker who was seated upon the doorstep of his home. Beyond a few broken windows there has been no destruction of property. Up to the present time passive resistance has been the strikers' method of indicating their desire to improve the conditions under which they work and live.

There have been within recent years a number of strikes in various silk mills and shops. Last year there was a strike affecting a large portion of the silk industry and this strike was ended by throwing the leader, Rudolf Katz, into jail for six months. But the silk workers at that time believed they had grievances which should have been heard by the employers. And the I. W. W. is merely the incidental occasion of the strike. The conditions under which the silk and dyeing industries are carried on are its cause.

Some three months ago the silk workers of Paterson left their work. There have been rumors and warnings flying about the city, but the silk manufacturers did not believe that the strike would be general. The immediate occasion of the strike was the adoption of the four-loom system in one of the largest silk mills of the city, and the attempt to have one weaver take care of three or four looms in a number of other mills. Two looms to a weaver had been the rule heretofore.

A few days later the shop committee submitted a list of grievances and demands to each one of the employers.

To the broad-silk employers they submitted a schedule of prices, which was to be standard in all the broad-silk mills. They demanded that no weaver should operate more than two looms, that no weaver should be discriminated against for taking part in the strike, that there should be organized a shop committee in each mill to adjust grievances with the employer.

The ribbon workers made a series of demands upon their employers, asking for the eight-hour day, a three dollar per day minimum wage and the installment of a price list dating from the year 1894. Be it noted that while the cost of living has risen more than forty per cent. since 1894, wages have decreased by one-third since that time.

The dyehouse workers submitted a number of demands to their employers. They asked for an eight-hour day, for a twelve dollar per week minimum wage for dyers' helpers, and for the organization of a shop committee to investigate grievances. They submitted a number of additional demands, concerning conditions and wages in the various branches of the dyehouse industry.

All of these demands were refused. The Broad Silk Manufacturers' Association, the Ribbon Manufacturers' Association and the Master Dyers held a number of meetings, refused to treat with their employees as an organization, published a number of paid advertisements concerning the "wisdom or folly of meeting with their employees" and demanded that the workers return to the mills under the old conditions. After the third week of the strike a number of public-spirited men and organizations tried to mediate between the strikers and the employers. The Board of Trade, the Aldermen, the arbitration committee of the Federated Building Trades of Paterson and the Ministers' Association offered their services. The strikers welcomed such mediation and were ready at all times to discuss the terms of a possible settlement. The employers in the silk industry stubbornly refused to be a party to meeting with the strikers or to be a party to mediation. The individual employer offered to meet with his own employees and did so on a number of occasions. But this led nowhere, for the silk workers are strongly organized and are holding together with enthusiasm and self-sacrifice.

The employers completely failed to understand the spirit of the strikers. The employers believed that if the "outside agitators" left the city the strike would be over. It might be ended temporarily in this fashion or by throwing the strike leaders into prison, as has been done re-

cently and may be done again, but the employers fail to realize that there are real grievances, that there is justice in some of the demands of the silk workers and that a temporary settlement of the strike by force or by starving the workers will lead to nothing but a renewal of the strike at an early date.

The employers had said that they are fighting the I. W. W. and that they would continue to fight it to the bitter end. Members of the executive committee of the silk manufacturers were asked whether they would admit the International Textile Union, a conservative labor organization belonging to the American Federation of Labor, to their mills, and whether they would invite them to Paterson to settle the strike. The reply made by the president of the Broad Silk Manufacturers and by other influential leaders among the employers was that *no form of labor organization among the silk employees would be tolerated in Paterson.*

During the last three months I have come into constant contact with the strikers and the employers. I have heard both sides of this controversy, presented with skill and intelligence. I have no hesitation in saying that justice will be found on both sides. Some of the demands of the strikers are perfectly just. Many of the conditions under which the silk industry has been carried on are intolerable and unjust. The unsympathetic attitude of the silk manufacturers toward their employees, and the physical condition of not a few of the mills, the chaotic wage conditions, all need investigation and correction. A federal investigation of the conditions under which the silk industry of the United States is carried on has been asked for a number of times.

To ask the workers to return after thirteen weeks of privation and suffering, without granting a single one of their demands, is manifestly absurd. Yet this is precisely what the employers are asking of their employees. And in order to break the strike they have enlisted the support of the courts, especially of the police court. The judge who presides at present in the police court has sent more than a thousand men, women, boys and girls to jail during these three months. I have been present in court and witnessed what seemed to me a manifest miscarriage of justice. I was also present during the first trial of Patrick Quinlan in the County Court. Mr. Quinlan is an agitator and a Socialist. Yet during the thirteen weeks of his agitation it has been remarkable to see the self-control of the strikers. And on the evidence that was submitted I could not convict him. In such a period of turbulence it is very difficult to get a jury free from bias. And I do not believe that the attempt to break the strike by means of the conviction of the strike leaders will lead to any such result. Paterson cries aloud for peace and there is no peace. A number of merchants are facing bankruptcy. Suffering and privation have been the lot of the silk workers and their families. A number of the smaller silk mills are facing bankruptcy. To starve the strikers into submission, so that they will return to the mills disheartened and broken; to drive a number of the smaller mills out of existence—these are two purposes that have become clearly defined as part of the program of the Paterson silk manufacturers and master dyers.

The conditions of living, the housing of the workers are distinctly bad. Some of the mills are firetraps. Sanitary conditions are evil. The wages of all the silk workers average between nine and ten dollars per week, and this during only seven to nine months of the year. Do not these conditions call for improvement?

The adoption of a plan similar to the peace protocol in the ladies' garment trade in New York is the hope of industry. It brings permanent peace, and permanent peace must be based upon justice. Says Julius Henry Cohen, the creator of the protocol:

> Let employers generally take notice. If they will but sit down and reason in conference with the rational representatives of organized labor, dynamite and sabotage will pass out of this land and diplomacy and voluntary courts of arbitration will take their place. Which is preferable? There is a crisis in our nation's industrial life. Let us meet it as statesmen, not as anarchists. The reactionaries in both camps —capital and labor—are the real enemies of society. Let us crowd them out. They have no place in an American democracy.

Paterson, N. J.

(Arguments in Brief, No. 1)

The Panama Canal Tolls Question

RESOLVED: *That the provision of the Panama Canal Act exempting the coastwise shipping of the United States from the payment of tolls should be repealed*

[The object of this series is to provide outlines of arguments and reading references on both sides of public questions of current interest. These will, it is anticipated, be of use, not only to debaters, but also to all readers who wish to know what are the chief points pro and con and where they can obtain further information on the subject. The briefs in this case are prepared by Miss Edith M. Phelps, compiler of the *Debater's Handbook Series*, published by the H. W. Wilson Co., Minneapolis.—EDITOR.]

While Congress was engaged in discussion of the Panama Canal Act of 1912, Great Britain lodged an informal protest against the act on the ground that the provision exempting the coastwise shipping of the United States from tolls was an infraction of the Hay-Pauncefote treaty of 1901. This was followed by a formal protest based on the argument that while the treaty left the United States free to build and protect the Canal, it maintained the principle of the Clayton-Bulwer treaty of 1850, guaranteeing to England the use of the Canal on complete equality with the United States. Moreover, it was intimated that if the offending provision was not repealed, Great Britain would seek to have the question arbitrated. Public opinion in the United States is divided on the question, and bills have been introduced into Congress for the repeal of the clause of the act in dispute. It is understood, however, that no action will be taken until Congress meets for the regular December session.

ARGUMENT FOR THE AFFIRMATIVE.

I. The United States is restricted by the Hay-Pauncefote treaty from granting the use of the Panama Canal to its own coastwise shipping on any terms not also open to ships of foreign nations.

Article III of the treaty stipulates that "The Canal shall be free and open to the vessels of commerce and of war of all nations . . . on terms of entire equality." Moreover, the provisions of this treaty are subject to the principle of neutralization laid down in the Clayton-Bulwer treaty, and to the rules of the Suez Canal Convention concerning the use of the Canal by vessels of all nations on terms of entire equality.

II. The history of the treaty plainly shows that this was understood when the treaty was made.

An amendment proposing to reserve to the United States the right to discriminate in tolls in favor of its own shipping was voted down.

III. The treaty cannot be abrogated on the ground of *sic rebus stantibus*, even tho the Canal was built in our own territory.

The condition *sic rebus stantibus* does not exist here, for Article IV of the treaty provides that no change of territorial sovereignty or of the international relations of the country traversed by the Canal should affect obligations of the two contracting parties.

IV. It is denied that no discrimination would result from the exemption of our coastwise shipping from tolls.

If no tolls are paid by coastwise vessels, the share of the cost of the Canal to be borne by other nations will be increased.

V. To discriminate in favor of our own shipping would be an unwise diplomatic policy.

Other nations would be disposed to retaliate by discriminating against our foreign commerce and investments.

We could not well refuse to arbitrate if England insisted, and it would be difficult to secure an impartial tribunal.

"If we arbitrate and lose, we must return all the tolls that have been collected and henceforth charge no tolls or collect the same tolls on all vessels using the Canal."—Emory R. Johnson, Special Commissioner on Panama Traffic and Tolls.

VI. To exempt our coastwise shipping from tolls would be an unwise economic policy.

It would be a subsidy to our coastwise shipping which is not needed, for American ship owners already have a monopoly of the coastwise trade.

It would offer no relief to our foreign shipping, which is badly in need of assistance.

Freight rates would not increase if tolls were charged. "The rates charged by steamship lines, being regulated by agreements among competing companies and being fixt with reference to what the traffic will bear, will presumably be

as high as traffic conditions warrant, regardless of tolls."—Emory R. Johnson.

Tolls on all vessels will be needed to make the Canal self-supporting. The annual revenue from tolls will be less than the expenses of the Canal for some years to come.

ARGUMENT FOR THE NEGATIVE.

I. The United States is not restricted by the Hay-Pauncefote treaty from granting the use of the Canal to its coastwise shipping on special terms not granted to ships of foreign nations.

The rules specified in Article III of the treaty were adopted as the "basis of the neutralization of the Canal, and for no other purpose, . . . and not intended to limit or hamper the United States in the exercise of its sovereign power to deal with its own commerce, using its own Canal in whatsoever manner it sees fit." —President Taft.

II. The exemption of our coastwise shipping from tolls is not a discrimination against other nations.

No other nation is allowed to engage in our coastwise shipping.

"There is nothing in the treaty to prevent any foreign power from remitting by subsidy or otherwise . . . every dollar expended by its subjects in the way of tolls." Senator O'Gorman.

The United States will bear the larger part of the expense of operating the Canal for many years to come.

III. The treaty can be abrogated on the condition *sic rebus stantibus.*

"A contract ceases to be binding as soon as anything which formed an implied condition of its obligatory force at the time of its conclusion is essentially altered."—Hall, *International Law.*

"The condition in reference to which the treaty was made never arose; and instead of the Canal's being built in alien territory, was built in territory of the United States."—Samuel Seabury, Justice, New York Supreme Court.

IV. To charge tolls on our domestic shipping would be contrary to our practice with regard to our domestic commerce.

"No vessel belonging to any citizen of the United States trading from one port within the United States shall be subject to tonnage, tax or duty, if such vessel be licensed, registered or enrolled."—R. S. 4220, Navigation Laws, Sec. 158.

Rivers and harbors have always been improved for the use of our domestic commerce without tolls of any kind.

V. The exemption of our coastwise shipping from tolls would be a wise economic policy.

Our shipping would be encouraged.

Reduced rates on transcontinental and interior railroad lines would result, and all parts of the country would benefit by such reduction.

If tolls were charged they would ultimately be paid by the American people in the form of increased rates.

The additional revenue sacrificed would be so small as to be immaterial. It is estimated that coastwise shipping would not be more than one-tenth of the entire traffic thru the Canal.

When May Comes to France

By Zitella Cocke

When fair young May comes into France,
No more the hunter's horn resounds—
No more thru valleys echoes ring
Of neighing steeds and baying hounds.
The tranquil deer repose at will,
Or feed upon the silent hill,
Or leap in play—all unafraid,
For wood and plain in peace abide
And o'er the land a hallowed rest
In precious time of sweet May-tide!

When lovely May comes into France—
Beneath her footprints lilies bloom—
And ere she lifts her magic wand
The glad earth answers in perfume.
While o'er the fragrant lilies fair,
Enraptured, hangs th' enamored air
Till breezes are but lilies' breath
And valley, mead and mountain hight
Drink to their fill of incense sweet
Wafted from censers virgin white!

When blithesome May comes into France
The swift staghounds she puts to shame—
With cunning wiles diverts their quest
And sweetly lures them from the game,—
Keen instinct and sagacious smell
O'ermastered by her subtle spell—
In vain the chant of mellow horn,
The wild halloo, the huntsman's call.
One scent alone thrills nerve and nose—
The lily's odor holds them thrall!

O fairest month of all in France!
Thy skies of violet soft as dawn.
We wonder not thy tender heart
Should pity trembling doe and fawn.
And it is meet that thou dost cheat
With sweetness staghounds fierce and fleet,
For thou thyself art Beauty's Queen.
So full of grace in all thy ways
No wrong should mar thy dear delight
Or break the charm of thy brief days!

And from thine art, our duller eyne
Shall read a lesson to obey—
How we with sweetness like to thine
May cheat temptation of its prey.
For hounds of Evil lose its scent
In heart made sweet with pure intent,
And lofty thought and noble deed,
Like lily whiteness, smell so sweet—
Behold, the baffled tempter flees
And quits the chase in grim defeat!

Boston, Mass.

INDEPENDENT OPINIONS

This opening of the editorial mail is a nerve-racking process, as hard on the constitution as when a cook has to go from the hot kitchen into the cold storage room and back again every few minutes. "Sometimes we're up and sometimes down," as the camp meeting song puts it. You never can tell whether the envelope you take up contains a check or a "stop-my-paper" notice. One letter will give us such high praise for brilliancy of style, profound scholarship and soundness of judgment that we are amazed at our own moderation in working for our present salary. The next will accuse us of such crimes and convict us of such errors that we feel unworthy not only to fill this responsible office, but even to live. Then, again, our self-esteem will be restored by a letter which shows unbounded confidence in our intelligence by asking questions which perhaps no mortal man is competent to answer.

The editor is indeed subjected daily to a "General Information Test" more stringent and varied than any we have printed for the puzzlement of our readers; advice as to the choice of college, occupation or reading, counsel on how to manage a municipality, a household or a poultry yard. "What is Cubism?" writes a perplexed college professor. "I can't find it in any dictionary." No wonder. It would require a daily dictionary with afternoon extras to keep up with the new schools of art that are springing up and dying down nowadays. We cannot *tell* what Cubism is, but if our correspondent will turn back to the number of March 6 he can *see* what it is and then call it whatever he likes. "Where is Mt. Copernicus?" was asked in the General Information Test of April 10. And a school ma'am in the West comes back at us with the question: "Where on earth *is* Mt. Copernicus? It isn't to be found in any of my geographies." We are surprised that the lady slipped up on that question, since the mountain in question is within sight of her own home and the same may be said of all our readers. It is therefore a much fairer question than if we had asked for Pike's Peak or Mt. Washington, which few have seen. Here the injunction "Look up and not down" is especially applicable. Still if we answer her question literally we should have to say "Nowhere on earth."

It is indeed delightful to be looked upon as a depository of information on which our readers feel that they can draw with confidence to any amount. But business before pleasure, and it is lucky for us that not all of the letters are of the purely catechistical kind. Here are both business and pleasure in one envelope:

> I have tried to think I could get along without the magazine, but I find I cannot. A habit of twenty-one years is too strong to break. It has taken me several weeks, however, to get together the five dollars. Try bringing up a family on $800 a year yourself and notice the strain. But I don't owe any man anything and I *must* have THE INDEPENDENT, so I think I will do without a new hat.
>
> Please send me the last two numbers. I have a feeling as of something missing.

The subscription, "Yours faithfully," appended to this letter, is of more value to us than the subscription, $5, enclosed, for such friends are worth having, and it is only because THE INDEPENDENT has a good stanch body of them that it has been able to stand the storms which have wrecked so many of its contemporaries in the course of the last sixty-five years.

But the next letter reminds us that it is impossible to suit everybody:

> I wish THE INDEPENDENT would be less womanish-minded on the Great Causeless Cause, the foolest enterprise the American woman ever entered upon—that of trying to achieve the ballot. The rottenest and damnedest cities in the United States are San Francisco and Denver—where the

women have been voting for years! Not one woman in ten really wants to vote. Furthermore, if men would only say what they think, and express their aversion and contempt for the whole thing, instead of smilingly and complaisantly taking the "anything the dear ladies want" attitude, it would have less publicity.

Governing is a man's job; and your recent fine editorial on "Our Nerveless Better Classes" seems to me to be in a way quite inconsistent with your stand on suffrage. Too much tenderness and sentimentality, both predominatingly feminine, in our administration of things now.

Furthermore and also; not a state east of the Mississippi has women's suffrage; Roosevelt is an impudent liar and fakir when he prattles of "light from the West": all we ever got from the West has been chiefly folly, such as Greenbackism, Haywoodism, free silver, Populism, and what not. That demagog's indorsement of women's suffrage ought to help to kill it!

And this man lives in Boston! What would he have said if he had lived in the wild and wooly West, where emotions are more violent and language less restrained? But seeing what an opinion the writer has of womankind it is no wonder he doesn't want them to vote.

The next letter in a measure restores our good opinion of ourselves:

Litchfield, Conn.

It is your due to tell you that the editorials in your last week's issue are a positive delight, and carry a mental and moral stimulus such as makes one glad that he is alive to read such literary tonic. The whole issue is fine. We preachers like to get a handshake and a good word after our work —here is mine to you.

But how few there are, preachers or not, who treat others as they like to be treated. This letter came, too, at the most opportune time, on "Blue Tuesday," the day after the paper has gone to press and when we are finding the typographical errors in it, all too late, and when we feel that it is probably the worst issue that we ever published.

Our editorial suggestion of last month that the circle of INDEPENDENT readers might be extended at little cost and trouble, brought a number of responses like the following, showing that many of our subscribers are in the habit of making the magazine do double or triple service:

In the April 3 issue of THE INDEPENDENT readers were urged to pass along their copies of the magazine. The following shows that this is already being done by some of those fortunate enough to have THE INDEPENDENT. A New York subscriber sends it regularly (note, *not* intermittently) to a cousin in Connecticut. This lady wrote to the Home Missionary Society of her denomination, asking for the name of some home missionary, to whom the magazine would be a help and pleasure. A name of such a man out on the frontier in Wyoming was sent, and every week the magazine goes out to this worker in his isolated parish, for its third reading, and probably it is "passed along" to his people. Correspondence with this pastor, by the Connecticut reader, led to the young people in the latter's church also sending their copies of *The Endeavor World* to several of the young people in the Wyoming church.

A CONNECTICUT READER.

It is becoming recognized that it is as important for young people to learn about the world they live in as about the world of their ancestors, so the study of current events has been quite generally introduced into the curriculum of our colleges and high schools. As a textbook for such courses THE INDEPENDENT has in many cases been adopted, and here is a letter telling how it is used:

Hancock, Michigan, April 11, 1913.

I wish my pupils to possess definite information and opinions about contemporary affairs, that, as students of history, they may the better appreciate the affairs of earlier times; and that, as citizens, they may the better appreciate the problems and interests with which they also ought to be concerned. As an avenue to such information and opinion, I requested our board of education to subscribe for a sufficient number of copies of THE INDEPENDENT to permit us to use the magazine in our classes in history. Since the beginning of the year, therefore, we have been receiving eleven copies of THE INDEPENDENT at our high school, and, at one recitation in five, its articles have been the subject of discussion for my second, third and fourth year history pupils. The instructor selects articles from the various departments of the magazine from the "Editorials" to "Finance," marks them in the table of contents, leaves the magazines on the principal's desk in the general assembly room, whence they are procured and read. In the class we take up such topics as seem of particular importance. It is the business of the instructor to explain doubtful points, establish connections with the ordinary course in history and to give general direction to the discussion. Wall maps, illustrations from the Paris *l'Illustration* and lantern slides are brought in as aids where this is practicable. After a few weeks the pupils caught the continuity of events, and now follow the

course of affairs as if it were a story "in ten chapters" in *The Youth's Companion*—interest being enlivened by the consideration that not even the writer knows the outcome of the narration.

Altho it is the business of the instructor to keep in touch with a half dozen standard weeklies, the motives which led to a selection of THE INDEPENDENT for our work are these: This magazine presents a positive and sane discussion of vital matters, yet one from which we can occasionally fairly dissent. It presents definite information, and trustworthy, unencumbered by discussion. Its articles are brief enough to fall within tne compass of high school pupils. It is devoid of nonsense and casuistry. It [illegible] a great deal of current history in [illegible] it is comprehensive and cosmopolitan in its contents. Now this looks very much as if I were writing an advertisement for the magazine, but I mean it simply as a statement of facts which formed our judgment. I esteem certain other magazines very highly, but I regard THE INDEPENDENT as peculiarly adapted to our needs. Very cordially yours,

L. A. CHASE, M. A.,
Instructor in History, City High School.

The article in our issue of March 27 by the Rev. B. F. Beazel, suggesting an abridged Bible for popular reading, called forth this letter from a man who, during a period of involuntary leisure, had the unusual opportunity of reading the Bible without bias or prejudice, and who expresses his opinion of it as frankly as if it were the latest novel:

Yesterday's *Ohio State Journal*, Columbus, has an editorial of approval of your proposal to abridge the Bible, etc., etc. During February, when in jail, I read most of the good book thru, and was disappointed with much of its contents. Ancient history, much of lewd matter, contradictions, repetitions, declarations, etc., which did not inspire me as I hoped for. I get most good from reading the *Christian Herald* and other like periodicals, for information and inspiration toward a betterment of myself. Go ahead.

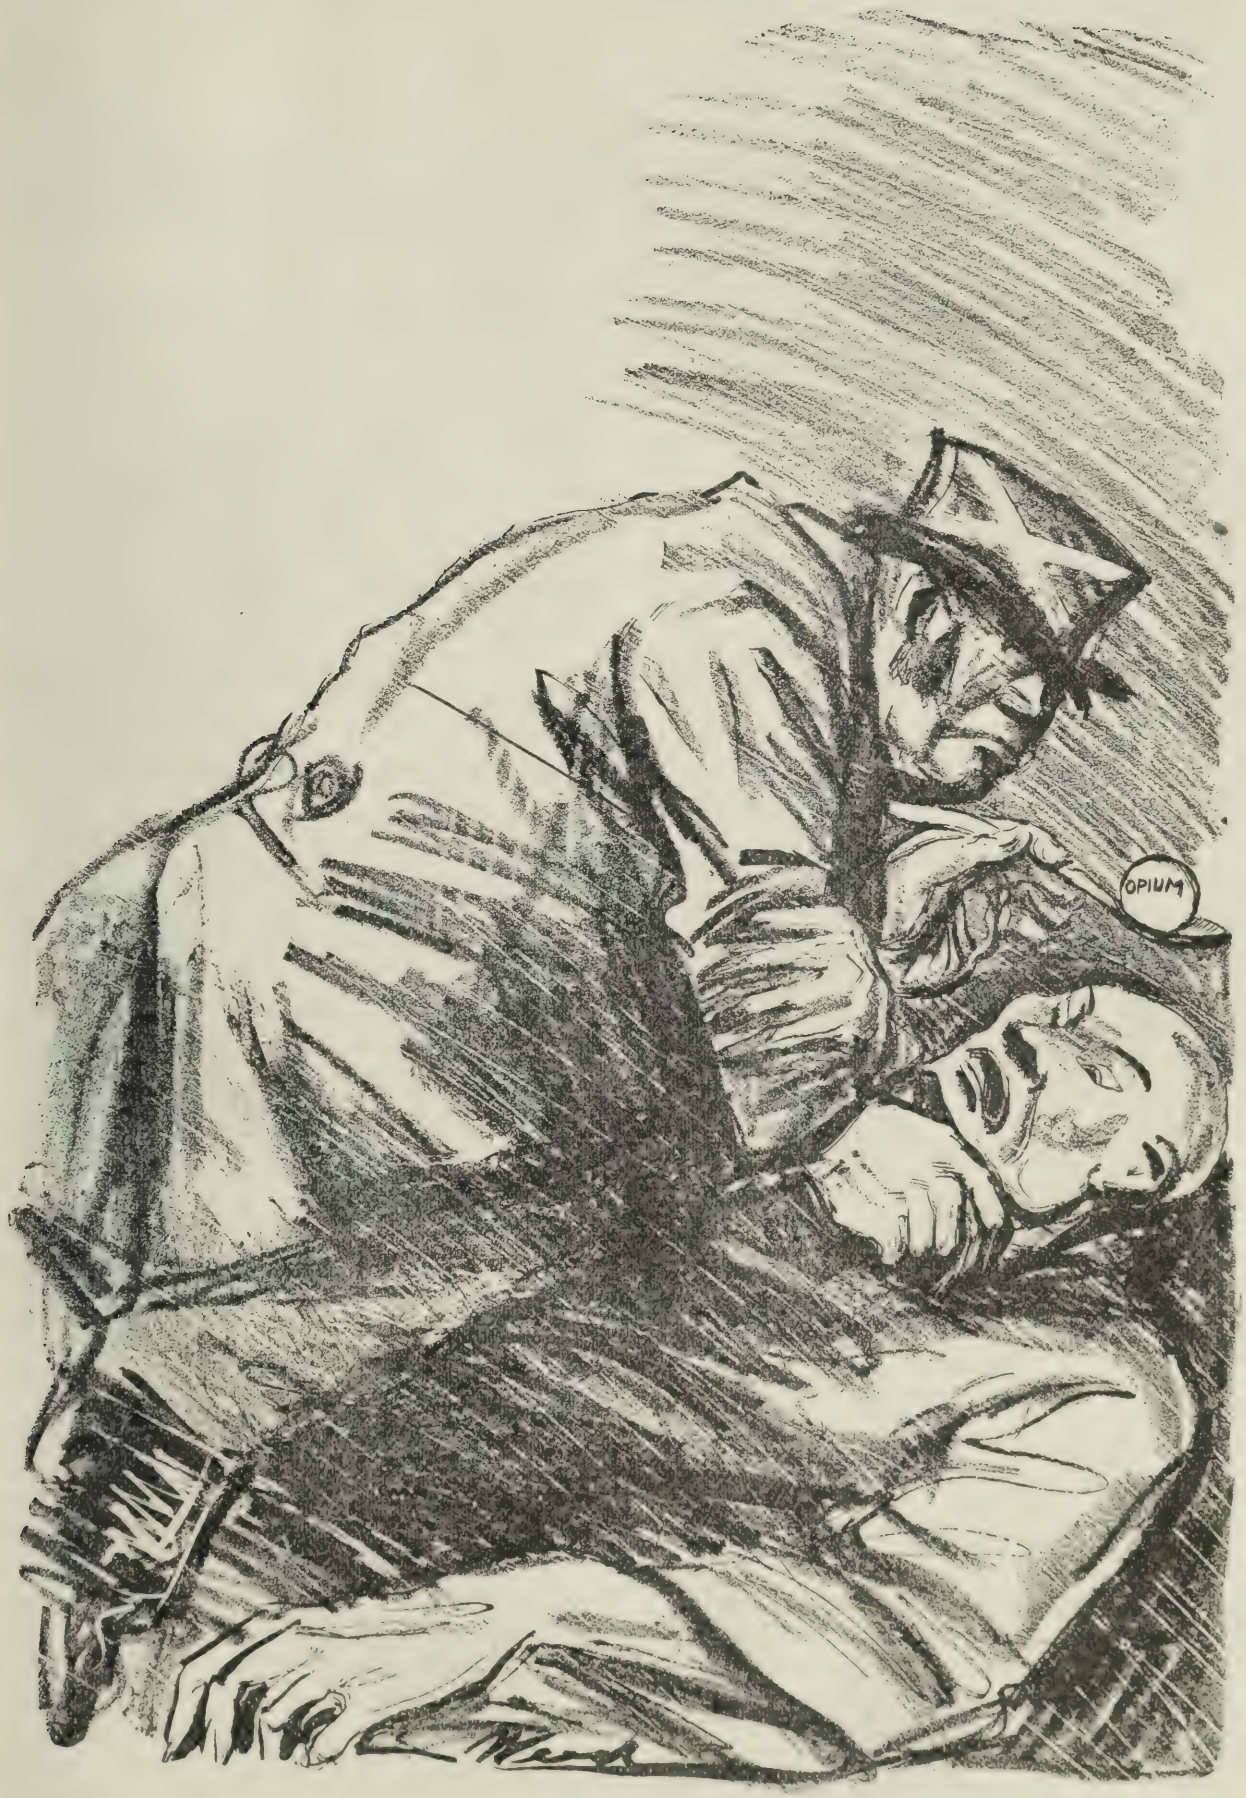
We are glad our correspondent appreciates the value of the *Christian Herald*, but we would remind him that without the Bible there would be no *Christian Herald*.

Apropos of the ever recurrent discussion of the canteen question, the following account of the experience and observations of a soldier are worth quoting:

Tucson, Ariz.

A few months ago THE INDEPENDENT carried a most interesting symposium, "What Is the Matter With the Army?" If I remember correctly, the articles were all written by generals or men intimately acquainted with the needs of our military system. Altho these generals did not say so, yet it is evident that another thing they regard as the matter with the army is lack of beer. For today we have the inspiring picture of the Secretary of War, the Chief of Staff and the Surgeon General all vigorously advocating the re-establishment of the canteen.

My observation is quite the contrary. During my army experience, it seemed to me that many soldiers not ordinarily given to drink would loaf about the regimental bar until sodden with beer. Then, when only semi-responsible, they would leave the reservation and become hopelessly intoxicated. These highly praised "light" drinks but fed their alcoholic appetite.



In my own regiment I had opportunity for fair comparison. At Santa Mesa the regimental canteen was at the foot of the company street next mine. I may be mistaken, but this seemed to me the most popular resort in the Philippine Islands. Men swarmed there, fights were not uncommon, and the guard house did a thriving business. A little later we moved to Santolon, the Manilla pumping station, but the canteen was not moved with us. The guardhouse was empty for days. The absence of the sodden, quarrelsome soldier was apparent to any one with eyes. A soldier at best doesn't have so very much to do, and when a beer saloon is thrust right under his nose he will drink merely to kill time. With the canteen gone he lets the liquor be.

One of the most vicious phases of the canteen question is that the men can get a certain amount of this liquor on credit. Pay for it is later deducted from the soldier's monthly salary. To my mind, the poorest way in the world to stop drinking is to put a beer saloon in close proximity to a large body of men, and allow them to get the liquor on credit. Money that now goes for useful and necessary articles at the post store went for liquor.

The story about the low dives in the vicinity of barracks is worked overtime. It is only too true that some soldiers do patronize such places, but at Fort Sill, Oklahoma, not one such place came into existence as the result of the abolition of the canteen. I have before me the letter of a regular army captain. He names post after post where of his own personal knowledge no such dives exist.

Besides, the very records of the army are eloquent for temperance. There has been a constant decrease in desertions. In 1909, 4993 men quit the colors without leave; in 1910 the number was reduced to 3464, and in the fiscal year ending June 30, 1911, there were but 2504 desertions. Men at all conversant with army life know that a large per cent of the desertions take place where men are not themselves because of liquor.

L. J. ABBOTT.

MORE FORCIBLE FEEDING?

THE NEW BOOKS

Romanticism and Its Reaction

*The Drift of Romanticism,** by a former literary editor of THE INDEPENDENT, Mr. Paul Elmer More, deserves a larger public than merely students of the romantic movement and readers of literary criticism. For, altho Mr. More's subject is literary, his interests are by no means narrowly intellectual. Conduct, faith, the need of a firm foundation for human life, these are the things with which he is most concerned. They are the problems of the literary critic, in so far as the critic must have a philosophy and a basis for critical judgment, but they are also the problems of every man who would not miss the very aim and purpose of his life.

Readers who are acquainted with Mr. More's notable series of *Shelburne Essays* need not be told of his fitness for his task. They can testify to the extraordinary range of his knowledge, his familiarity with the best that has been thought and said. The leading ideas of the present volume have run thru all his work, but here he has given them a fuller development and a clearer expression than before. Mr. More himself is romantic in his capacity for insight and, on occasion, sympathy; but in his power of discrimination, his strength of character, as character enters into his work, and his philosophy of life, he measures up to the best classic tradition.

The Drift of Romanticism is the eighth volume of *Shelburne Essays.* Under this title Mr. More has brought together a group of papers upon William Beckford, Cardinal Newman, Walter Pater, Fiona Macleod, Nietzsche and Huxley, each of whom he takes as representative of an essential phase of the romantic spirit. It is not too strong a statement to say that no other single work throws so much light on the nature of romanticism. Rudolph Haym, in his standard work on the philosophy of the romantic school in Germany, made no such penetrating study of the movement as Mr. More does here. Haym treated romanticism as tho it were shut up in the past. Mr. More finds it still living and working and coloring all our life; to him it is the "dominant tendency and admitted ideal of the modern world." It is in the air, and has set men restless and adrift. Hence the importance of understanding it and of possessing a principle, such as he offers at the close of the volume, with which to meet and oppose it.

In his preface Mr. More compares romanticism in its absolute form, as it is found thruout classical literature, with the peculiarly dissolving romanticism of the nineteenth century. In Beckford he studies the morbid egotist who seeks expression and relief in an atmosphere of strangeness and wonder; in Newman a soul which "has lost its true vision of the infinite and seeks a substitute in the limitless expansion of the emotions"; in Pater the philosophy which would make beauty and pleasure the ends of life; in Fiona Macleod the pantheism and revery of the Celtic revival; in Nietzsche the revolt, in the name of egotism, from humanitarian sympathy; and in Huxley the relation of romanticism, first, to the earlier philosophical science and the "religion of nature," and then to the pragmatic flux and *élan vital* of today. The relations of these men to each other and to the main currents of the age are traced in a way that makes the book indispensable, not merely to students of romanticism, but to all who wish to understand the deeper implications of modern thought.

The book is rich in definitions of its subject. Thus Mr. More defines romanticism as the denial of classical dualism, the ancient distinction between good and

**The Drift of Romanticism.* By Paul Elmer More. Boston: Houghton Mifflin. $1.25.

evil. It is a "morbid and restless intensification of the personal emotions"; "the mere limitless expansion of our impulsive nature"; the strangeness and wonder that "proceed from, or verge towards, that morbid egotism which is born of the union of an intensely felt personality with the notion of infinity as an escape from limitations." This goes considerably deeper than Theodore Watts-Dunton's definition of romanticism as, merely, the "renascence of wonder." Again, romanticism is

> the infinitely craving personality, the usurpation of emotion over reason, the idealization of love, the confusion of the sensuous and the spiritual, the perilous fascination that may go with these confusions. It is like a dream of fever, beautiful and malign by turns; and, looking at its wild sources, one can understand why Goethe called romanticism a disease and classicism health. He might have added that disease is infectious, whereas health must be acquired or built up by the effort of the individual.

One other definition that comprehends all the rest should be added. It is "the expansive conceit of the emotions which goes with the illusion of beholding the infinite within the stream of nature itself, instead of apart from the stream." One would look far to find other definitions that tell so much about the real nature of romanticism.

Mr. More considers romanticism the source of the last century's greatest evils —"its dark materialism, its intellectual pride, its greed of novelty, its lust of change, its cruel egotism and blind penance of sympathy, its wandering virtues and vices, its legacy of spiritual bewilderment." In "Definitions of Dualism," a series of aphorisms which concludes the volume, he gives his own philosophy of life. It is a thoroly masculine faith, not new—for originality, as he says, would undermine the very basis on which he stands—but making plain the need of qualities, now neglected or ignored, which have stood the test of time. Against the romantic life of instinct, impulse, and rationalism, he sets "that true infinite within the heart of man, which is not of nature, and whose voice is heard as the inner check, restraining, centralizing, and forming." Not the literary critic alone, but every man, must have within himself this inner standard, this living law, that comes of spiritual insight. He shall give himself up neither to his emotions nor to his reason, but

> trust,
> With faith that comes of self-control,
> The truths that never can be proved.

Faith needs to be sustained by religion. We must learn again to pray. "Therein shall a man learn to know the truth of his own being and see with open eyes the infinite consequences of that truth; and from thence he shall go out into the world armed with power and assured in peace."

In all that Mr. More has written he has had steadily in mind the regeneration of the individual. The man who follows him will indeed be saved from moral ruin, from indifference to what is best and highest in his nature; he will find a principle to build up and strengthen and give wings to his soul. But Mr. More will not please those who are trying to redeem men in the mass. He sees no other way than that every man must work out his own salvation.

The Drift of Romanticism is incomparably Mr. More's best work. He has cut to the very heart of his subject, and a single one of his many glowing phrases tells more than another man's whole volume. The book has a message which, direct as it is to our own age, is true for all time. Readers will find in its pages some of the best critical work that has been done in this country; but beyond this we believe they will find in the way that Mr. More points out, release from a multitude of opinions, from doubt and unrest and confusion. The final conception that one carries away from the book is of a strong, clear-sighted, deeply earnest man, a true mystic, who, rising by self-discipline above the flux of the world, has gained the character and vision that give life vital purpose and unity.

The Novels of Richard Pryce

Two years ago a singularly delightful impression of childhood was given to us in *Christopher*. We did not care for him grown-up, still we had hopes of Mr. Pryce. We still have, since the importation of his earlier works shows how seriously he takes himself and his vocation. *Time and the Woman* (Fenno, $1.25) should have been allowed to lie forgotten—it is mere froth—but the other three are of real worth. In

Jezebel (Houghton, $1.35) too much is made of the name and the plot is as old as *Romeo and Juliet*. Again his children are delightful; why cannot he make them grow up as charmingly? True, *Elementary Jane* (Houghton, $1.35) never did grow up. Thru all her struggles from the little singer in a third-rate music hall and the limelight of West End success to the tragedy of deserted wifehood she preserves unbroken the sincere simplicity and wholesomeness of childhood.

The Burden of a Woman is perhaps the strongest of these novels (Houghton, $1.35). The charm of the little Welsh village and its primitive people is the background for a very appealing treatment of the old theme—what is real purity? Mr. Pryce's work shows a delicacy and insight which make us, as we said in the beginning, hopeful.

The Sociology of the Bible

Mr. Louis Wallis has rightly emphasized the social significance and interpretation of the facts concerning the genesis and development of religion in his volume entitled *Sociological Study of the Bible* (University of Chicago Press, $1.50). Only a view that takes in the entire complex of social forces is large enough to account for the origin and growth of the religious faith of the Hebrew people. Possibly for this very reason, the author's attempted explanation of the peculiar trend and character of Israel's religion on the basis of the persistent conflict between the primitive Amorite and Israelite elements of the national life is not convincing, altho his arrangement of the materials is very suggestive and many valuable sidelights on both the history and religion are scattered by the way. Altogether, too much is made of the technical *Mishpat* as the center of the prophetic struggle, the phases of which cannot be brought under the limits of any single term or generalization. Nevertheless, Mr. Wallis has made a fine contribution to the study of the Bible and religion as a whole.

British Social Politics

No sources for modern history are more important than those which deal with the revolutionary social and political changes introduced by the British Liberal government in the last seven years. During that brief period workingmen's compensation, old-age pensions, social insurance, radical land and housing legislation, and new principles and methods of taxation have been carried thru Parliament, and a way cleared for further progress by the abolition of the permanent veto of the House of Lords. Prof. Carlton H. Hayes has given us in *British Social Politics* (Ginn, $1.75) an admirable source book for this period, containing summaries of debates and party history, speeches by the leaders of the Liberal, Unionist and Labor parties in both houses of Parliament, and, most important of all, the text of the various measures or their more significant clauses. Minor legislation affecting conditions of labor, trades unions, the unemployed and child welfare is also treated at some length. In this book are the chief documents from which the history of England for the period from 1905 to the present will be written.

The Washington MS. of the Gospels

The importance of the gathering of materials for development of American archeological or humanistic scholarship is illustrated in the volumes of which this is one of the most important. The purchase in Egypt by Mr. Charles L. Freer of a number of very early Greek manuscripts of portions of the Bible, with some Coptic fragments, gave the opportunity for them to be edited in this country, and the work was taken up by Professor Sanders, of the University of Michigan, who had previously been devoted to the study of Roman history and literature. He has already issued a volume on the Freer manuscript of Deuteronomy and Joshua, and has in preparation one on the Psalms. The present quarto volume, part one of *The New Testament Manuscripts in the Freer Collection*, being the Washington Manuscript of the Four Gospels (Macmillan, $2), will be followed by one on the Epistles of Paul.

Of this manuscript we spoke editorially last week, giving its unique addition to the last chapter of Mark. It is one of the very oldest manuscripts known, ranking with the Smaitic at the Vatican, being probably of the fourth century, with the exception of a single quire in the Gospel of John. It is noted as W, and will be known as the Washington Gospels, as it will be deposited in the National Library by Mr. Freer. Professor Sanders has made an exhaustive study of its text, with the view to relating it to the accepted families of the New Testament text. He finds it to have been copied from earlier exemplars themselves closely allied to the old Latin, Syriac and Sahidic versions, but in parts corrected after the Antioch and Hesychian recensions. This is shown by minute study of the characteristic readings classified accordingly. This discussion takes up more than half of the volume, the remaining portion consisting of a

complete register of the various readings. There are also several photographic plates of pages. The work is most careful and creditable to American scholarship, and proves that the line of scholars of whom Ezra Abbott and J. Henry Thayer were examples has not yet ceased to carry on textual studies of the New Testament, and that the stream of learning has past on from Harvard to Michigan.

The Heart of the Hills

The moral obligation of veracity is great for any writer, especially so for the popular one, and doubly so in a country where works of fiction have ceased to be mere incidental pleasure-producers and have become potent factors in influencing opinions about political, social and economic situations, and even about a whole country.

Now, Truth is a tyrant. So long as an author remains in the nebulous regions of her empire he possesses a certain freedom, but once he wanders into the broad, light plains of fact he is bound thereafter; whatever in his book does not partake of the innate nature of truth throws the whole out of balance and leaves the reader confused and deceived. For just that reason John Fox's new novel, *The Heart of the Hills* (Scribner, $1.50), seems to fall short. He has placed his scene in Kentucky and has chosen the instinctive antagonism of the mountaineer for his Blue Grass neighbor as the pivot for his story. Around this he revolves more complications—mountain feuds, political dissension, and economic turmoil. He gives us an exact and vivid idea of the life of the Kentucky mountaineers and does the same for the Blue Grass Kentuckians. But then, after having gone so far and so successfully into truth, he turns about and places his four main characters—two from the hills and two from the Blue Grass—in such a highly colored, strained and unnatural relationship to each other that he throws his whole book out of focus and the reader involuntarily repudiates some of the most significant features of the novel. In the midst of simplicity Mr. Fox has placed artificiality and it is a very evident misfit.

Jason and Mavis Hawn are cousins and the children of mountaineers who have lived in the mountains for generations; who have fought to hold them inviolate from the marauding hands of commerce, who, away from them, have yearned for them as children yearn for a mother, and who, among them, have loved them with almost primitive passion. Opposite to these two are Gray and Marjorie Pendleton, cousins also, but the children of Blue Grass aristocrats who have always enjoyed the luxuries of wealth and position. The four meet during childhood and Jason immediately displays a furious antagonism to Gray, which continues for years. In the course of time a vague mutual attraction grows up between Jason and Marjorie and Gray and Mavis. But gradually each realizes the impossibility of such a relationship as marriage. The children of the mountains are bound by harsh poverty and grim traditions incomprehensible to the two from the Blue Grass. And so, in the end each returns to his own kind—Jason to Mavis, and Gray to Marjorie. It is unfortunate that Mr. Fox did not work out this splendid idea with persons more sincere in their emotions and more veracious to life.

Moreover, he has not been content with burdening his really good story with poorly developed main characters. He has added the handicap of careless mechanical construction — tautology, involved sentences and grandiose language which obscure his ideas, and, most noticeable of all, faulty chronology in the growth of the four principal persons. The reader is conscious of little or no difference between the minds of the little boy Jason and of the little girl Mavis and that of them grown to full manhood and womanhood.

Nevertheless, however critical one may be of Mr. Fox's method of conveying the idea of the alien spirit of the mountaineer, nothing save praise is due him for his simple and almost perfect descriptions. There is nothing artificial about them and they are as refreshing as one of the mountain streams. Quite as perfect in their way are certain situations in the book which, considered separately from the story, are splendid pieces of dramatic action. Finally, over and above all criticism, one remembers that Romance is an autocrat. She blindfolds truth and leads both author and reader astray. Keeping this in mind, one finds this story singularly pertinent and interesting.

Italian Journeys

Few visitors to the centers of Italy's artistic and historic interests are able to lay aside their well-thumbed tourist guides, forget for the time the haunting of the critics, and acquire fresh, unstudied impressions of these much frequented places. Mr. Russel W. Leary possesses in addition to this power a gentle humor and a vivacious style which will secure for him enthusiastic readers of his delightful volume on *Italian Lanes and Highroads* (McBride, Nast & Co., $1.10). Those who have never seen the ruins of Rome or gazed upon

Florence from Fiesole will enjoy the vividness and piquancy of his descriptions illustrated with happily chosen views, and many who have passed thru the usual tourist experience will travel the familiar ways again in Mr. Leary's pages with renewed pleasure and insight.

Literary Notes

Prof. A. C. Crowell, of Brown University, has translated from the Danish of Dr. Karl Mortensen *A Handbook of Norse Mythology* (Crowell, 75 cents), adding here there some illustrative poems translated directly from the Icelandic.

In Holt's series of the World's Leaders ($1.75 per volume) appears a volume by Dr. W. L. Bevan on the *World's Leading Conquerors* — Alexander, Cæsar, Charlemagne, a group of the Ottomans, Cortez and Pizarro, and Napoleon. Such a volume as this necessarily has no unity and this particular volume lacks distinction of style —just as its arrangement is lacking in attractiveness.

No small part of the fiction which has our South for the scene offers as gracious heroines the most beautiful of belles. Here in *Sally Castleton; Southerner,* by Crittenden-Marriott (Lippincott, $1.25), is another of these tales told with some feeling which however cannot blind us to the trite situation nor the improbable outcome. Mr. Wyeth's pictures create much of the vividness.

The fourth volume of the English translation of Ludwig Friedländer's valuable survey of *Roman Life and Manners* (Dutton, $2.50), which has been highly commended in THE INDEPENDENT (see particularly the issue of January 21, 1909), is entirely devoted to the appendices and notes, occupying more than 700 closely printed pages. This brings to completion a work of vast learning and careful research, which constitutes a worthy contribution to the history of society.

Henry C. Shelley makes *The Art of the Wallace Collection* the subject of his latest volume (Boston: L. C. Page & Co., $2). This is at once a tour of the wonderful gallery, such as American visitors to London will find useful as a guide, and a rapid survey of certain art-fields: Dutch and Flemish cabinet pictures, nineteenth century paintings, etc. There is, too, a sketch of the founders of the collection. Mr. Shelley is a very competent and clever literary journalist, and, as usual, acquits himself most creditably.

F. Berkeley Smith in *The Street of Two Friends* (Doubleday, $1.50) tells stories that have some of the charm of the *vie de Bohême* which the author himself says is fast passing from Montmartre and the Quartier. They are told with the impressionistic touch of the artist and the feeling of the lover of old Paris.

The visitor to London who is opprest by the city's distances and griminess will find in Anthony Collett's *Country Rambles Round London,* precise directions for fifty excursions, and descriptions of Kent and Sussex and Surrey, the upper Thames country, the western outskirts, the Chiltern Hills, etc. Train times are considered as well as train fares and there is a useful index of place names. (New York: McBride, Nast & Co., $1.)

In the useful series entitled Cambridge Manuals of Science and Literature appear an account of *Methodism* by Dr. H. B. Workman, *The Origin of Earthquakes* by Dr. Charles Davison, *Spiders* by Cecil Warburton, *Brewing* by A. C. Chapman, *The Work of Rain and Rivers* by Dr. T. G. Bonney, *Life in the Medieval University* by R. S. Rait and *Goethe and the Twentieth Century* by J. G. Robertson. These additions to an attractive series are issued by G. P. Putnam's Sons at 40 cents each.

The Macmillan Company has responded to the popular demand for cheaper editions of recent fiction by issuing James Lane Allen's *The Reign of Law* and *Kentucky Cardinal,* H. G. Wells's *The Wheels of Chance* and *New Worlds for Old,* Robert Herrick's *The Common Lot, Elizabeth and Her German Garden,* and Mrs. Roger A. Pryor's *The Colonel's Story,* in the modern Fiction Library. And these are only a few of the titles. The price of these volumes is fifty cents each, as is the price of several worthy additions to the Standard Library: Hearn's *Japan,* Professor L. H. Bailey's *Country Life Movement,* D. E. Lyon's *How to Keep Bees for Profit,* C. S. Valentine's *How to Keep Hens for Profit,* Kate V. St. Maur's *A Self-Supporting Home* (with chapters on vegetable gardens, fruit growing, poultry raising, etc.), and Mary Conyngton's *How to Help: A Manual of Practical Charity.* In the Rural Textbook Series of the same publisher appears *Farm Management,* a volume by G. F. Warren ($1.75), and in the Rural Science Series *Co-Operation in Agriculture,* by G. Harold Powell ($1.50). All of these volumes with the exception of the last two are reprints. In spite of the low price, the type used is excellent and the paper quite as good as it is reasonable to expect.

SURVEY of the WORLD

Reduction of Death Rates

A notable reduction of the general death rate in the State of New York—which contains nearly one-tenth of the entire country's population—and of the rate for infants and three controllable diseases, in the last quarter of a century, is shown in a report from the state's board of health. The board's tables are for five periods of five years each (beginning with 1885) and one of three years. For each period the average population is, of course, taken into account, and it has risen from 5,800,000, in the first, to 9,300,000, in the latest. If we begin with the second period—as returns for the first are said to have been incomplete—it appears that an increase of 45 per cent in average population has been accompanied by an increase of only 12¾ per cent in the average annual number of deaths, while the general death rate has fallen from 20 to 15.4 per thousand.

Deaths of children less than five years old were 37.4 per cent of the entire number of deaths in the first period, and only 25.4 per cent in the last. The reduction is also shown by a decline of the number of deaths per 100,000 of population from 632 to 408. In other words, childhood mortality has fallen from three-eighths of the total to one-quarter of it, and, despite the growth of population, the annual number of deaths in this class is now less than it was fifteen or twenty years ago.

The three controllable diseases to which the statistics relate are typhoid fever, diphtheria and tuberculosis. From 1.4 per cent of the entire number of deaths to 0.8 per cent has been the reduction of typhoid mortality. The decline is indicated in another way by a reduction from 27 to 14 deaths per 100,000 of population. This improvement has been due mainly to the purification and protection of water and milk supplies. Not many years ago the typhoid death rate of Albany, the capital, was disgracefully high. Now that city's water supply is cleansed by filtration.

The most remarkable gain is seen in the figures which relate to diphtheria. In the first period, diphtheria's percentage of the whole number of deaths was 5.1; in the latest it has been only 1.0. And the number of deaths per 100,000 of population has fallen from 104 to 22. This great saving of life may be ascribed mainly to the discovery and use of antitoxin.

In the decade beginning with 1885 about one-eighth of all the deaths were caused by tuberculosis of the lungs. The proportion has declined from 12.6 to 9.7 per cent, and the number per 100,000 of population from 214 to 155. While the population has nearly doubled, the actual number of deaths from this cause has increased by only 1500 a year.

The dark side of the report is seen in what is said about cancer. Twenty-five years ago the annual number of deaths from cancer was about 2000; in 1912 the number was 8234. While the state's population has not quite been doubled, the cancer deaths have been quadrupled. The annual rate is now 85.9 per 100,000 of population. It is 83.6 in the cities, and 92.9 in the rural districts. The difference to the disadvantage of the latter would be greater if account should be taken of rural residents who die in city hospitals.

Home-and-School Report Cards

"I got ninety in brushing my teeth this month! What'd you get?"

This is the sort of question Michigan children are asking each other this spring, for the home-and-school report card is being tried out in Hillsdale and other counties as a new means of bringing about increased coöperation between the teachers paid by the state and the more responsible ones who are not. The National Bureau of Education is interested in extending the experiment.

On a single card the parent marks the standing of the child in home work, the teacher in school work. Home markings cover the subjects of sewing, mending, bread making, cooking, setting and serving table, washing and wiping dishes, washing, ironing, sweeping, making beds, dusting, the care of younger children, making fires, getting water, coal and kindling, feeding stock or poultry, milking cows, barn or yard work, garden or field work, errands, brushing teeth, combing hair, dressed and ready for breakfast on time, in bed by nine

o'clock, cheerfulness, kindness, order and care of clothes, bathing, table manners, politeness and thoughtfulness. The teacher will mark the attendance at school, times absent or tardy, and the grades in reading, writing, arithmetic and the other usual studies.

Five hundred cards were sent to the County Commissioner; these have been given out to teachers for use during April, May and June of the present spring. It is thought that both parent and teacher may accomplish much more in training the children with the all-around knowledge of the youngsters' behavior and ability.

Memphis Establishes a Bird Refuge

Memphis is doing its utmost to preserve birds by providing a refuge for them. For nearly three years Dr. Richard B. Maury, a prominent citizen, has been lecturing to the children of the public schools on this subject and forming junior Audubon classes along the lines marked out by Mrs. Russell Sage's beneficence in furnishing a fund of $15,000 for distributing bird literature to the southern schools.

One result of this work has been a petition to the Tennessee Legislature to enact a law protecting the robins. This was signed by 6040 school children of the city. Another result was the setting aside for a parkway of a strip twelve miles long, surrounding the city on three sides, with a strip on each side of the parkway as a refuge or sanctuary in which the birds and other wild life would be free from molestation. This refuge was established by the Memphis Commission; its action is considered a progressive step in humanitarianism. In the words of Dr. Maury, "the farming interests round about are bound to feel its beneficial effect because of the economic value of birds in checking the growth of insect life, which is most destructive to crops."

Value and Cost in Beef

An investigation at the Illinois Experiment Station into the relative economy and nutritive value of the various cuts of beef has yielded some interesting results. The flesh of three choice young steers of approved breeds was used, each yielding chilled dressed beef to about 60 per cent of the live weight. The average yields of straight cuts were: Loins, 16.76 per cent; rounds and chucks about 22 per cent each; other cuts less. The lean in straight wholesale cuts varied from one-third in the flank to two-thirds in the chuck.

After elaborate analysis of the meat-constituents, the examiners declare that there seems to be no relation between market prices and the percentages of fat, protein, extractives and ash. The cheaper cuts appear to be as valuable for sustenance as the dearer, and in some cases more so. In purchasing beef for protein merely, regardless of tenderness and palatability when cooked, the neck, shank and clod are the most economical cuts, and the rump, rib and loin the most expensive. In general nutrition and adaptability, the clod, chuck and plate are the most economical parts to buy. Of the various steaks, the porterhouse were found to be highest in net cost of edible meat, and chuck steaks the lowest. Of the roasts, the first cut of prime ribs was relatively dearest, and the rump cheapest. The boiling or stewing pieces of least value in proportion to price are the shoulder pot-roast and clod, shank stew and neck yielding more substance.

"In general," the report concludes, "the low-priced cuts were by far the most economical sources both of lean and of total edible meat. It is evident, therefore, that market prices of the various retail cuts of beef are determined chiefly by considerations other than their relative food values."

Letter Boxes on Trolley Cars

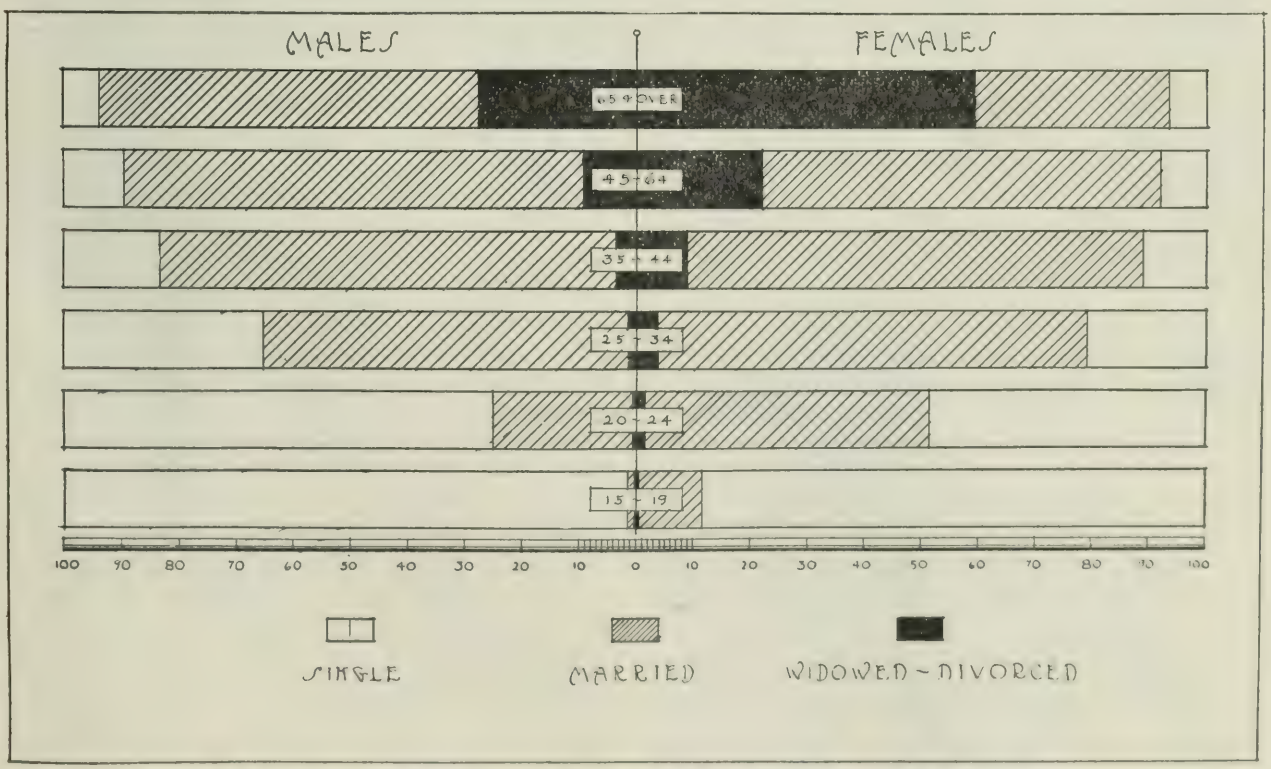
Letter boxes on street cars may be found in Des Moines and Burlington, Iowa, and Grand Rapids, Michigan. In England this scheme has been in operation for some time, especially in Huddersfield, where sixty of the regular cars carry an iron letter box hung on the back. All of these cars pass a central point in their regular run and must stop there in any case, so no time is lost when the conductor takes off the box, sets it on one shelf and takes from another shelf an empty box. Thus each box is removed about once an hour; at the central station a collector takes the mail from all these boxes every hour from 6 a. m. to 10 p. m. to the central post office.

Passengers may post letters on the cars or mail may be put in the box while passengers are getting on and off the cars. The conductors are not prohibited from taking mail from people while the cars are moving, as it is easy to slip it into the box nearby at the back of the car. If one signals the car to stop for the purpose, one gives the conductor a penny (two cents), the minimum carfare, and he punches a ticket for it as tho for a regular fare.

The people in the outlying districts are greatly benefited, as they can send a letter to the central post office every hour as easily as those living in the center of the

city. The Huddersfield corporation owns and furnishes the boxes. The Post Office pays $1500 a year for the service and for the free transportation of collectors of mail. It is not a source of revenue to the trolley companies, but is maintained as an accommodation to the citizens.

Less Foreign Than Wales



An American by the name of Jones traveled thru the outlying provinces in the Philippine Islands and found little difficulty in conversing with the natives, because the children spoke good English and some of the adults could understand him even tho they could not speak his language. Some months later, while on his way to home via Europe, he stopped in Wales to visit his relatives, but found that his uncles spoke no English and he could not speak a word of Welsh, so he had to talk thru an interpreter. Even when one proud uncle brought forward a daughter who had studied English as a foreign language in the Welsh public schools, the situation was not greatly improved; for when the girl was induced to recite " 'Tis the night before Christmas" in supposed English, Jones was unable to figure out just what she was trying to say until near the end of the recitation. Anglicization seems to be progressing more rapidly in the Orient than in the Occident. Perhaps the Americans do know a little bit about handling Orientals even tho they have not had as much experience as the British.

Age at Marriage

Except for a few states, there are no accurate statistics of the age at marriage in the United States. We are therefore forced to rely upon the Census figures on the marital condition of the population of this country. In the accompanying diagram is given the distribution by marital condition of the males and females by age groups in the United States.

Age.	Per cent single.	Per cent married.	Per cent widowed or divorced.
15 to 19 years:			
Male	98.3	1.1	0.1
Female	87.9	11.3	0.3
20 to 24 years:			
Male	74.9	24.0	0.6
Female	48.3	49.7	1.7
25 to 34 years:			
Male	35.0	62.8	1.9
Female	20.9	75.1	3.9
35 to 44 years:			
Male	16.7	79.2	3.9
Female	11.4	80.1	8.4
45 to 64 years:			
Male	10.1	80.6	9.1
Female	8.0	70.0	21.9
65 years and over:			
Male	6.2	65.6	27.9
Female	6.3	35.0	58.4

From 15 to 19 years the proportion married among females is over ten times as great as that among males. The proportion married for females exceeds that for males at all age periods up to 45, but above this

MARITAL CONDITION OF OUR POPULATION BY AGE-GROUPS

age the proportion married among males is much higher, and for the group 65 years and over it is nearly twice as great. The proportion widowed is at all ages considerably higher for females than males. This is due to the higher death rate of males and to the fact that at marriage the husband is usually somewhat older than the wife.

The proportion married has been steadily increasing in this country since 1890. This increase, however, is in the ages below 35 years. This would seem to indicate that our people were marrying at an earlier age than formerly, but that the proportion married in the upper age groups was on the decrease. The age at marriage of women depends very largely upon racial and social conditions, while that of men depends more upon economic conditions. When it is possible to support a family at an early age men are likely to marry young. When, as a result of long apprenticeship or protracted period required to learn a trade or profession, considerable time elapses before earning capacity is sufficient to warrant the assumption of additional responsibility, the age at marriage is likely to be high. We therefore reach the conclusion that the young men of this country do not find it increasingly difficult to establish a home.

WILLIAM B. BAILEY

Assistant Professor of Political Economy, Yale University.

Diaporthe Parasitica

Of all plagues that afflict the vegetable kingdom none is more to be feared in this country than the *Diaporthe parasitica* or chestnut bark disease. Unless some method is found to check its spread, it is not unlikely that at no remote generation there will not be a chestnut tree living in the country.

The blight is not an insect but a fungus. As soon as its spores have gained an entrance into a tree, they germinate and spread with remarkable rapidity in the living inner bark, until the mycelia completely encircle the trunk or branch. The canker develops wherever it can gain an entrance; if it is discovered before it entirely girdles the branch it may be removed by cutting out the affected parts and waterproofing and sterilizing the wounds. This method is not always sufficient to prevent the spread of the disease and is only used when a few trees are to be saved.

Spraying is utterly futile as the fungus lives within the bark out of reach of any external application, but it may arrest the growth of the disease if the liquid can be brought into contact with the spores. The mixture consists of two parts of pine tar to one part of creosote, with sufficient lampblack to give the desired color.

According to the *Scientific American* Pennsylvania is waging perhaps the most active war against this disease of any of the nine states in which the pest is now found. Pennsylvania's method is simply to fell all the trees along the border of the blighted zone. The bark is removed from the merchantable part of the trunk and burned with the branches and small twigs. The bark is also removed from all the stumps and burned. By thus working from the circumference of the infected area to the center it is hoped that the disease will be in time completely eradicated. The cure is preventive instead of remedial. It is heroic, but it seems to be the only way to save a noble species of tree.

What Does Milk Cost?

What is the cost of producing a quart of milk? The United States Government says four cents, or to be more accurate 4.16 and 4.8 cents, based on the actual cost of growing and harvesting products consumed by the cows and the cost of labor. The yearly cost of one cow is $165.95, or if her feed is valued at market prices, $191.82.

The United States Government based their figures on tests made at New Jersey experiment stations with thirty-one milch cows, mostly Guernseys, Jerseys, grade Holsteins and Ayrshires, fed with home-grown feeds and also with purchased feeds. The yield of thirty-one cows averages 8661 pounds of 3.96 per cent milk (with 3.96 per cent of butter fat). The average cost of feed per cow per year, based on actual cost of producing the crops used, was $95.73 or 2.4 cents per quart of milk produced. If the feed is reckoned at market value, the cost per cow per year was $121.60 or 3.04 cents per quart. The estimated average cost of labor (but not supervision) and incidental expenses was $70.22 per cow per year, or 1.76 cents per quart. By incidental expenses is meant bedding, stabling ($5 per cow), interest on investment in the animals, depreciation in value of the cows, keep of bull, but not interest on land, buildings and dairy equipment. No credit is given the cows for manure or calf, neither is the farmer's time charged for. Calculating manure worth $20 a cow and the grade calves $6 each at five days old, the cost of producing 4 per cent milk, even with high yields reported and including cost of supervision, was approximately four cents a quart.

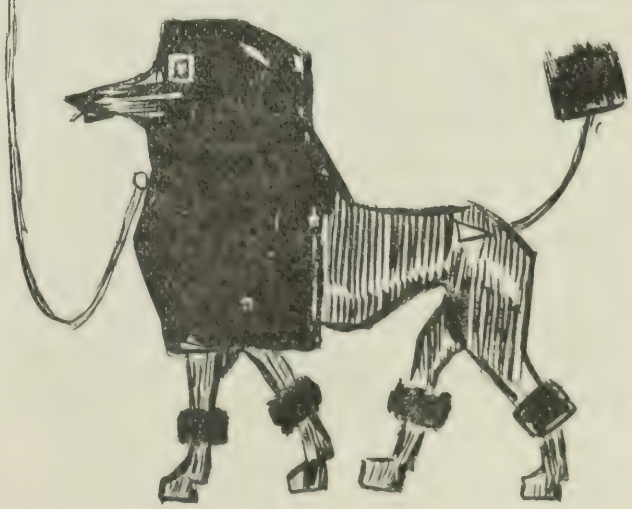
New York experiments reached a similar

result, but the Ohio station found that the net production cost in that state was 6¼ cents per quart.

Cubist Fashions

So the dresses that his sisters and his cousins and his aunts are going to wear this season will be cubist and futurist! Such is the information vouchsafed us by no less an authority than the *American Cloak and Suit Review* in its current number.

The department stores have had their exhibitions of importations of the very newest models by Poiret, Premet, Collot, Lanvin, Doucet, Paquin and Worth.

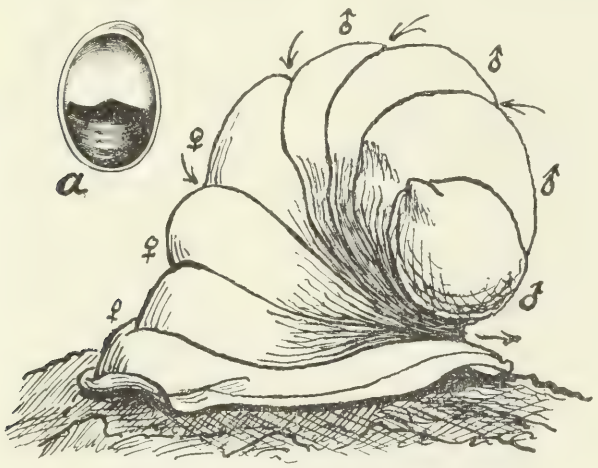


The costumes were at first shown upon living models posed upon a deep square stage lined with black. The lights were thrown upon the figures from above and from footlights and "the effect was indescribably beautiful." Each pattern was arranged by an artist of the new Futurist School who came especially from Paris for this purpose. After this impressive ceremony a Cubist tea was served in an adjoining room. The maids were arrayed in brilliant red turbans, blue gowns, wide yellow and green silk draped girdles and tiny square aprons of various brilliant tints. The cakes were of tiny cubes. "Even the chairs and paper napkins were in greens, yellows and reds."

And now for the costumes themselves. They abounded in simple Oriental lines. Low draped girdles accompanied each dress which finished in stole effects. The transparency of the white upper bodice was effected by V-draped chiffon laces reaching to the top of the girdle. Flowing draperies of "shadowy lace" hung from the shoulders. A panel effect outlined with plaits at either side was laid into the front of this drapery and held in place at the lower edge with a "plastron of brilliants."

Even more startling fancies are reported from Longchamps, where the Englishwomen in the paddock quite out-Parised Paris. Wasp gowns, tight-fitting costumes of soft dull silk with wide stripes of black and yellow about the waist, were worn by tall women. Unsymmetrical decorations ruled the day—trimming on the left different from that on the right, gowns severe in front and elaborate behind, material disposed in various unequal divisions. One remembers that Matise paints facial irregularity with fidelity—even with emphasis. Should not the gown harmonize with the wearer's personal appearance?

Hats were Cubist, literally. Waterproof silk of divers shades, shaped in



a perfect cube, untrimmed save for a wide ribbon showing many hand-painted cubes of garishly jumbled colors, completed the whimsical costumes.

The Half-Deck and Its Balloons

British naturalists are much interested in the introduction and rapid spread on their shores of our common slipper-limpets, or half-decks, introduced with the planting of American oysters in English waters. They think its spawning habits very strange.

A CHAIN OF SPAWNING LIMPETS

Lower three older female (♀) individuals; upper four males (♂). The upper arrows indicate entrance of fresh water; the lower the common exit of waste water and the spawn. *a*, interior of a shell, showing the slipper-like, or half-decked form.

In the early summer these little, almost stationary, mollusks creep together in heaps, one upon the other, sometimes a dozen or so forming a connected chain. Males and females are about equally mixt, but the matter of sex is one of age, for this limpet begins as a male, and later becomes a female.

In spawning it constructs fifty or sixty membranous bags or capsules, in each of which are placed about 250 eggs. Then it closes the bags and attaches each to the adjacent surface and to the next bag by a short cord, so that the heap of limpets presently looks as if covered with a bundle of tiny balloons. The larvæ, after hatching, swim about for a time before settling down and assuming the form of limpets.

The Moon and Wireless Telegraphy

Many observations have been made by investigators, among them Mr. A. M. Curtis, Mr. Marconi and Mr. W. H. Eccles, upon the effect of moonlight on radio-telegraphic communications. The general impression is that the effects of the moon are greater than has been generally supposed. Indeed, they are of the same order as the influence of the sun. Hereafter calculations will always have to be made with lunar radiations in view.

If the influence of the sun can be justly defined as charging the earth's atmosphere with cathode or ultra-violet radiations direct from Old Sol, then the conclusion must be drawn that the reflected or indirect ultra-violet radiations from the moon act in the same way. There are some ultra-modern astronomers who are radical enough to hold that the moon really emits rays of its own in such abundance as to account for its influence upon wireless sparking.

There are four nights just after the full moon upon which this lunar effect is too great to be ignored. Upon such nights the moon bursts forth across the horizon at sunset; the effects are in evidence even if the moon is not visible. A rising full moon at this time may become confused with a setting sun and some skeptics maintain that the influence is a residual solar phenomenon, not a lunar one. The latest observations, however, do not support such a view.

It may be the tides in the atmosphere, it may be the electro-magnetic radiations from the moon, it may be some influence by the moon upon the earth's corona. Even the hydrogen atmosphere, about 150 miles up, has been blamed. The fact remains that with the rise of the full moon a novel and unusual manifestation begins to show itself wherever wireless telegraphy is used. This consists for the most part in strange interferences that resemble breaks in the messages with corresponding difficulties in filtering out or picking up the flashes.

Thus, when a radio-telegraphic instrument is attuned to a wave of certain dimensions, as long as there is no moon or any solar effect, messages will be sent and received as expected. Suddenly, however, when these celestial influences appear, the wireless waves will be irregular and broken up much as the eddies and ripples from a stone or fishing line break up the larger waves in a pond.

Foreign Land Owners in Japan

In connection with the agitation in California against land ownership by foreigners ineligible for citizenship, that is, by Orientals, it has often been asserted that Japan has no right to complain, since she does not permit foreigners to own land. This statement, while true if ownership means ownership in fee simple, conveys an altogether wrong impression.

There are three ways in which foreigners may hold land in Japan: (1) By ordinary lease, running for any convenient term and

renewable at the will of the lessee. The rent of such leased property is, however, liable to a review by the courts, after a certain number of years, on the application of either party. (2) A so-called superficies title may be secured in all parts of Japan, save what may be called colonial areas, running for any number of years. Many such titles now current run for 999 years, and so far as appears they might run for 5000. These titles give as complete control over the surface of the land as a fee simple title would do. (3) Foreigners may form joint stock companies and hold land for the purposes indicated by their charters. Some of these charters contain provisions practically limiting membership to foreigners. They are juridical persons formed under the civil code of Japan and are regarded as just as truly Japanese legal persons as tho composed solely of Japanese. Foreigners are excluded from membership in corporations subsidized by the Japanese government, but I think from no others.

Aside from the three classes of holdings mentioned above, in the concessions of the old extra-territorial days, permanent leases are obtainable by purchase, from time to time. The rental on this property is fixed by the terms of the original deeds, at Yen, 28.00 per hundred *tsubo* (400 square yards) per year for the business sections and considerably less for the residence sections of the concessions. In Yokohama the rental on the Bluff lots is Yen, 12.00 per hundred *tsubo*. This rental is in lieu of all other taxes, and the Hague Tribunal has decided that this stipulation gives immunity from taxation to all buildings or other improvements on such lots.

These permanent leases have been the subject of much controversy; but many of the lots have already passed into Japanese hands and it is probable that this special form of ownership will ere long disappear.

From the above statement it will be seen that whatever else may be said in defense of the California projects it can not be contended that they place no more disabilities upon the Japanese residents there than the Japanese law places upon foreigners in Japan.

D. C. GREENE, D. D.,
Tokyo, Japan.

Day and Night Street Signs

The latest thing in the way of a street sign has been introduced by a Southern California building company and is now in use near Los Angeles, California. In the southern section of the Golden State the various companies which subdivide acreage into building lots and erect homes thereon rival among each other in the creation of new and novel street marking monuments. This electric street indicator is not an expensive affair, but still it lends beauty and distinctiveness to the streets and the tract as a whole. It works both night and day. During the day the letters composing the names of the streets are plainly visible, while at night an electric light inside of the marker shines thru the transparent letters. The old method of striking a match to see the wording on the signpost is done away with.

The post is about eleven and a half feet in hight. On a lower section of red brick rests a hollow cement cap in which the glass street sign is set. On top of the cap is a frosted glass globe. Two forty-candle-power electric lamps are used for each standard, one in the cap, the other in the globe.

The entire system, which comprises about forty standards and eighty lights, is operated by a large clock.

ARE YOUR STREET SIGNS AS GOOD?
In this California town they are not content with slabs on posts. The street name is illuminated at night.

Philadelphia, Pa.—Angus Carney, who has announced that he is his own grandfather, has his neighbors doing mental arithmetic which makes the age of Anne a mere primary problem.

Carney has compiled the following: "I met a widow with a grown daughter and I married the widow. Then my father met my step-daughter and married her. That made my wife the mother-in-law of her father-in-law, and made my step-daughter my step-mother. My father became my step-son.

"Then my step-mother, the daughter of my wife, had a son. That boy was, of course, my brother, because he was my father's son. But he was also the son of my wife's daughter and therefore my grandson. That made me grandfather of my wife's grandson.

"Then my wife had a son. My mother-in-law, the step-sister, is also his grandmother, because he is her step-son's child. My father is the brother-in-law of my child, because the step-sister is his wife. I am a brother of my own son, who is also the child of my step-grandmother. I am my mother's brother-in-law. My wife is her child's aunt. My son is my father's nephew and I am my own grandfather."—*San Antonio Light.*

Fifty Years Ago

From **The Independent,** May 28, 1863.

THE UNITED STATES OF COLOMBIA.

—The National Convention, called by a decree of Gen. Mosquera, to recognize the Government of New Grenada, assembled at Rio Negro, in February. The new form of organization proposed by Gen. Mosquera has been adopted, under the name of the United States of Colombia. We translate the following extract on the question of removing the capital from Bogota to Panama:

"When, in 1821, the Liberator (Bolivar) sent Ministers Plenipotentiary to Mexico, Peru, Chili, Buenos Ayres, and Guatemala, to form a treaty of alliance with those republics, he indicated Panama as a point important for the meeting of a Congress of Plenipotentiaries of the Spanish-American Republics. Bolivar considered the Isthmus of Panama as the most precious jewel of Colombia, and the natural seat of the government of a great nationality, which should result in the consolidation of republican institutions of the New World. . . .

"Gen. Mosquera met the objections raised by some against removing the capital to Panama. He says Panama would be very easy to communicate with from other countries, and the best center of the Spanish-American Union. The North American United States would naturally join it. The prejudices of education and local antipathies would melt away under the influences of such a general point of union."

Cartoon of the Week

A SUFFRAGET RECIPE

"My dear, I always use two cups of guncotton."—A cartoon by Minor in the St. Louis *Post-Dispatch.*

THE WEEK

The Controversy with Japan

Governor Johnson signed, on the 19th, the land bill which has given offense to the Japanese, and at once our Government's reply to Japan's protest was handed to the Japanese Ambassador. It is understood that in this reply the United States insists that the treaty has not been violated. In Japan it was received with regret, but its friendly and diplomatic utterances appear to have commended it to the government there, and the reports as to the situation at once became more favorable. It is said that Japan holds that there has been a violation of the treaty. In addition her pride has been wounded by what is regarded as an expression concerning racial inferiority.

The controversy did not prevent legislation at Tokio appropriating $600,000 for the Empire's participation in the Panama Canal Exposition at San Francisco. Attempts to check public clamor in Japan were made by the Government, and in Washington Mr. Wilson urged Representative Sisson, of Mississippi, who had announced his intention to speak on the subject, to refrain from offending Japan.

The serious illness of the Emperor of Japan began, on the 22d, to divert public attention in his country from this controversy. President Wilson seized the opportunity to send at once a cable message of sympathy and good wishes. This was well received. The message was prominently displayed in the Japanese press. Two or three days later a marked improvement of the Emperor's condition removed anxiety. Some think that Japan will ask for legislation here making Japanese eligible for citizenship. Four prominent Japanese have arrived at San Francisco. One is a member of the Senate and another is president of the Presbyterian College at Tokio. They will inquire as to the controversy and the condition of Japanese in California.

Washington Topics

The President has accepted the resignations of Gen. John C. Black, president of the Civil Service Commission, and William Washburn, a member, which were formally handed to him at the beginning of his term. The successors of the officers will be C. M. Galloway, of South Carolina, and G. B. Wales, of New Hampshire. As Mr. Wilson has supported the principles of civil service reform, his action is not regarded as hostile to the merit system. It is understood that he came to the conclusion, on account of methods brought to his notice, that the Commission needed new blood.

At a meeting of the Executive Committee of the Republican National Committee it was decided by unanimous vote that a special meeting of the National Committee should be held sixty days after the end of the present session of Congress to consider the advisability of holding in 1914 a special national Republican convention to settle differences. It is expected that such a convention will be held. A committee was appointed to consider legal questions which may arise in connection with a reduction of representation from the South. A reduction was urged in a letter from Senator Cummins, representing the sentiments of the recent meeting in Chicago. The Progressive party's executive committee says that amalgamation with any other party is out of the question. Mr. Roosevelt says it is idle to talk of amalgamation.

Secretary Daniels is convinced that the manufacturers of armor plate have not treated the Government fairly. It is alleged that their bidding has not been competitive and that their prices are extortionate. Senator Ashurst has introduced a bill appropriating $1,600,000 for a Government factory in which armor plate shall be made.

Conviction of Senator Stilwell

In New York City, on the 24th, State Senator Stephen J. Stilwell was convicted of soliciting a bribe at Albany. The extreme penalty for such an offense is ten years in prison and a fine of $5000. George H. Kendall, president of the New York Bank Note Company, complained that the Stock Exchange discriminated unjustly against his company by barring securities engraved by it. He prepared a bill to prevent such discrimination, and was directed by Governor Sulzer to consult Stilwell, chairman of the Senate's Code Committee. The bill was introduced and then referred to this committee. There it lingered, and Kendall says that when he complained of the delay Stilwell asked him to pay $500 for each of four members, with $1500 more

to be used in procuring a report in the Assembly, or House.

Governor Sulzer urged Stilweil to resign. This he refused to do. He was tried in the Senate, where the vote was in his favor, 28 to 21. Then he was indicted. Action has been taken quickly. The offense was committed on March 31, the Senate voted on April 15, he was indicted on May 10, the trial began on May 21, and three days later he was found guilty. He represented a district in that part of New York City which is called the Borough of the Bronx, and this was his third term in the Senate.

The Philippine Islands

Speaking at a dinner in Washington, last week, Secretary Daniels said the only menace to our peace was due to the purchase of colonies in the East, the inhabitants of which did not come to us of their own free will.

It is understood that Professor Henry J. Ford, of Princeton University, has been a personal representative of President Wilson in the Philippines, where he has visited many parts of the archipelago. It is reported that he has been engaged in an investigation and that the results of his inquiry are to be given to the President.

Mexico

There was not much fighting in Mexico, last week, but the gains were on the rebel side. Near Sacramento, in the northeast, 100 Federal soldiers were ambushed and killed. The rebels increased their hold upon the railroads. Dispatches to the Associated Press said that they were a dominating force in the rural districts of every Mexican state. At the capital there were signs of hostility toward Americans, owing to our Government's failure to recognize the government of Huerta. On account of this feeling, and because of the deplorable condition of the country, the exodus of Americans continues. Many refugees are crossing the boundary or going by sea to San Francisco or Galveston.

After an exciting debate, Congress authorized the negotiation of a loan of $100,000,000, and it is understood that arrangements have been made for borrowing $75,000,000, the bonds to be sold at 90 and to bear 6 per cent interest. The lenders are two banks in Paris. It was asserted in Congress that the Government had rejected an offer made on more favorable terms. Governor Carranza has sent to the British and French Governments his warning that the rebels, if victorious, will repudiate the loan.

In one of the northern states, D. J. Crockett, grandson of the famous David Crockett, was captured with two other Americans while watching a battle. Having been denounced as spies, they were stationed, with six Mexicans, in front of a firing squad. The Mexicans were killed, but the Americans, having been spared by the soldiers, were unhurt. They were permitted to cross the border to Texas. In Zacatecas, John Walker, an English owner of a mine, was attacked by eleven of his employees. He defended himself with an automatic pistol, and was aided by his wife, who used a rifle. They killed five and wounded three of their assailants, and were enabled by a Spanish priest to reach a place of safety.

Cuba's New Government

The new President of Cuba, General Mario Garcia Menocal, was inaugurated on the 20th. A long procession followed him to the palace, where he took the oath of office. Much enthusiasm was shown by the people. Our Government sent as special delegates Mr. Malone, third Assistant Secretary of State, and Brigadier General Crowder. They were introduced immediately after the oath had been taken, and Mr. Malone delivered President Wilson's message of congratulation and good will, expressing his "hearty sympathy with every element of good government in Cuba" and his purpose to "support" there "a firm and just Government against all elements of disorder." Mr. Wilson, the delegate said, earnestly desired a most cordial understanding between the two countries. Believing that such co-operation was possible only when promoted by justice and law, he would seek to make justice and "a firm opposition to all arbitrary and irregular force the basis of mutual intercourse." The American people had no sympathy with those who sought to seize the power of government in order to advance their personal ambitions. They most earnestly and sincerely desired that Cuba's future should be one of uninterrupted advance toward peace, prosperity and security. In the course of his reply, the new President said that his purpose was to maintain the most cordial relations with the United States. He was confident that these relations would become more intimate for the benefit of both countries and without disturbing the liberties of either.

President Menocal was born in Cuba forty-six years ago. One of his uncles was Aniceto G. Menocal, an engineer in the United States Navy, who is remembered in connection with his survey of the Nicaragua Canal route. The new President was graduated at the Maryland Agricultural

College in 1884, and at Cornell University four years later. He built railroads in Cuba and won high rank as a soldier in her wars. For some years past he has been the manager of three great sugar estates. Enrique Jose Varona, the new Vice-President, was formerly professor of philosophy and ethics in the University of Havana. In the Cabinet are Ezequiel Garcia, formerly professor of literature in that university, and Jose Villalon, professor of mathematics there and a graduate of Lehigh University.

Central America

In Nicaragua, the government has found large quantities of arms and ammunition, which had been hidden by persons believed to be interested in a revolutionary conspiracy. Therefore it has issued a decree placing the republic under martial law. Many suspected men have been imprisoned.

Great Britain having constrained Guatemala to resume the payment of interest on her foreign debt, American creditors are now pressing their claims. Complaint has been made to Secretary Bryan by a publishing company which printed for Guatemala's government eighteen years ago 450,000 school books. These the government sold to pupils in the schools, but failed to pay the publisher. After some delay it gave the creditor some bonds, secured by a part of the taxes. But interest was not paid.

By the explosion of 32,000 pounds of dynamite, on the 18th, the dike by which the waters of the Pacific had been withheld from the Panama Canal was removed, and the ocean was admitted. A few days later, two steam shovels, one from the east and the other from the west, met in the Culebra Cut, and the excavation at grade was completed there, altho much more must be done before the required width is obtained.

South America

There have been many arrests in the capital of Venezuela. Dr. Batista and General Penalosa, members of the Government Council, fled to Curacao, arriving there last week. General Hernandez, a revolutionist commonly called El Mocho, now in New York, says he has been asked to lead a popular revolt against President Gomez. The Council, he says, declined to approve a treaty made by Gomez with France. Its approval of such agreements is required by the constitution. Gomez, he asserts, placed several members of the Council in prison, but Batista and Penalosa escaped.

Following the discovery of revolutionary plots in Ecuador there have been many arrests. Mounted police patrol the streets of Quito and Guayaquil. Congress has authorized the President to use extraordinary measures for the preservation of order.

C. E. Akers, a British rubber expert employed by the Brazilian Government to suggest plans for defending the rubber industry of the Amazon Valley against East Indian competition, advises that the export tax, now about 20 per cent, be reduced by three-quarters, that 50,000 Chinese coolies be imported, and that rubber planters be brought from India to instruct them in modern methods. The planters will be employed at once. From Japan 3000 settlers are coming, to take lands offered to them by the Government.

Argentina's Cabinet has been considering a bill, soon to be introduced, limiting the number of cattle and sheep to be killed for export. Probably the bill will be passed. The preparation of it is due to attacks upon the American Beef Trust, which has large interests in Argentina. Cattle breeders oppose it, asserting that the Americans are paying very high prices for cattle. It is alleged, however, that the Americans are plotting to drive native packers out of business, and to obtain full control.

The Wedding of a Princess

Princess Victoria Luise of Prussia, daughter of the German Emperor, and Prince Ernst August of Cumberland, were married with the rites of the Lutheran Church on the evening of May 24. The ceremony took place in the chapel of the Imperial castle at Berlin. The bridegroom is a member of the dethroned Hanoverians and this marriage heals a breach of long standing between his house and the Hohenzollerns. Tho the day was a rainy one, the streets of the capital were filled with people and many of the houses were decorated. Prince Ernst and his bride are spending their honeymoon at one of the Kaiser's hunting lodges, Hubertusstock.

This wedding brought to Berlin many notables, including the Czar of Russia, who came in an armored train with an army of secret police, and George V of England. Newspaper dispatches suggest that the German Emperor seized upon the occasion to work for a betterment of the relations between Great Britain and Germany. King George in replying to an address presented to him by British residents of Berlin on May 23, said: "The preservation of peace is my fervent desire, as it was the chief aim and object of my dear father's life."

Emperor William pardoned three British subjects serving sentences as spies in Germany—this just before the coming of the British monarch. Bertrand Stewart, a London solicitor, was arrested in February,

1912, and sentenced to three and a half years. The others, Captain Trench and Lieutenant Brandon, were caught spying on the North Sea coast in December, 1910, and sentenced to four years detention in a fortress. The German press, with the exception of one Pan-German organ, commend the pardon of the Englishmen as "an act of knightly courtesy to King George and the British nation."

Military Notes

A resolution striking out 1008 additional army lieutenants and 1044 non-commissioned officers from the number demanded by the German Government in the new Army bill, was adopted by the Budget Committee of the Reichstag on the 24th, after it had been introduced by the Center party.

It was asserted that this action had been taken because the number demanded was not available, as there were not enough aspirants for commissions. The possibility of dissolution is under discussion, owing to the disposition of the Centrists and the Socialists to cut military appropriations. The *Lokal-Anzeiger* asserts that in the course of the discussions of the Budget Committee in April, when the members of the Center and the Socialists were vigorously slashing the bills, Imperial Chancellor von Bethmann-Hollweg sent word to the Centrists that the Reichstag would be dissolved if they persisted in their course.

The warning was at that time effective, and the Centrists even intimated their willingness to restore three cavalry regiments which they had cut out on the second reading of the Army bill. Their position is now less conciliatory.

On the 24th the draft of a bill authorizing the French Government to borrow $200,000,000, or about that sum, for twenty years, in order to meet military expenses, was submitted to the Cabinet by Charles Dumont, Minister of Finance, and approved. M. Dumont explained to his colleagues his plans for increasing the Government's revenues by $40,000,000 annually.

The French Premier's prohibition of a demonstration against the three-years' service bill on the occasion of the annual Communist procession to the Mur des Fédéres, bordering the Père Lachaise Cemetery, where prisoners were shot by the government troops in 1871, is violently attacked by the Socialists, and has been made the question of the maintenance or fall of the Barthou ministry. Altho the ministry won a victory of 381 votes against 186, the fact remains that nearly one-third of the Chamber of Deputies openly declare for civil war, for the principles of the General Labor Confederation, for the sabotage of mobilization material in case of war, etc. There is even a suggestion of gravity in the situation conveyed by the recent conference of President Poincaré and his bitter political opponent, Georges Clemenceau, at the Elysée Palace. The visit lasted half an hour, and was the first meeting of the rivals since the Presidential election. M. Clemenceau, after hesitation, seems to have temporarily abandoned his venomous attacks on the Cabinet. Investigations concerning the secret campaign of the Labor Confederation, which has instigated mutinous demonstrations in the French army, show that French Socialism is more violent and destructive than anything yet seen in Germany or England, and is aimed at all forms of government that rely on armed force or the police to maintain law and order. On the 25th, 20,000 persons attended a meeting at Pré St. Gervais, outside the Paris fortifications, to protest against the three years' service bill.

Moreover, the exaggerated statements concerning insubordination in the French army have been published with sensational comment by the German press at the moment when Emperor Nicholas and King George, the two most powerful friends of France, are wedding guests at Berlin. Says the Paris correspondent of the New York *Tribune:* "The French Labor Federation, under the lead of Jaurès, Vaillant and Wilm, is making a tooth and nail fight to re-establish the Paris Commune."

Germany in Africa

Berlin dispatches of last week stated that Germany was to obtain a free hand to expand her colonial empire in Central Africa as the price of surrendering her rights in the Persian Gulf section of the Bagdad Railway. This was to be the "compensation" in return for Germany's consent to the pending Anglo-Turkish convention whereby Great Britain acquires control of the terminal of the Bagdad road and practical possession of the strategic harbor of Koweit, on the Persian Gulf.

Germany was to be permitted, the report continued, to negotiate with Belgium and Portugal for the creation of a vast traffic system in Central Africa, in which the voice of the German Government should be paramount. This is a euphonious way of putting the fact that the Kaiser is to be allowed to realize his long cherished ambition to absorb the bulk of Portuguese Africa, and to acquire a large slice of the Belgian Kongo, without British opposition.

The fact that the Kaiser had decided to extend to King George a pompous welcome

when he arrived in Berlin to attend the wedding of the Kaiser's daughter was interpreted as evidence that the visit was an event of political magnitude. An official statement issued at Berlin on May 22 denied, however, that discussions on Central Africa had taken place with Great Britain.

In the Balkans

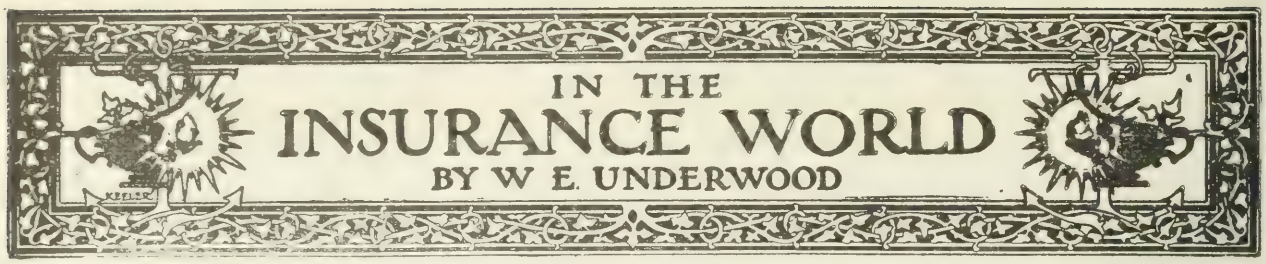
It is reported that King Peter of Servia will abdicate as soon as a treaty of peace is signed with Turkey. The King is in his sixty-ninth year, and his health is said to have broken down under the responsibilities placed upon him by the Balkan War.

It is said that Bulgaria is no longer holding up the peace negotiations at London, but certain other of the allies, who demand modifications of the terms fixt upon in the preliminary sessions of the commissioners. Four hundred million dollars is given as the amount of the indemnity demanded. Bulgaria's share would be half, says the Bulgarian Minister of Finance.

Reports of the assassination of Essad Pasha, who commanded the Turks at Scutari thruout the siege by Montenegrin and Servian forces, were current last week. Essad Pasha has had pretensions to the throne of Albania.

A battle between Greeks and Bulgarians in the Panghaon district was reported from Salonika on May 22. A Greek captain was killed and 250 men were killed or wounded. It is reported from university towns in Switzerland that students from Greece and Bulgaria enrolled there have been ordered to return and to join the colors. King Constantine of Greece, accompanied by Prince Alexander and the general staff, left Athens for Salonika on the 23d. The King of Greece was said, next day, to be trying to establish a neutral zone between the two armies. A mutiny broke out last week in the Bulgarian army at Seres. Some of the men demanded to be disbanded. Their commanding officer committed suicide when he proved unable to quell the disturbance.

Complications in China



The text has been published of a letter from Dr. Sun Yat-sen, the first provisional President of China and the creator of its republic, warning the five nations of the danger to China and to their interests if the Quintuple Power loan of $125,000,000 contracted for is completed. The conditions which have led to this very serious protest go back to the establishment of two principal political parties in China.

The Republican party supports the present Provisional President, Yuan Shi-kai, who owes his election to the resignation of Dr. Sun Yat-sen who urged his choice, as being a man of great ability and of tried progressive principles. But his administration has been charged with tyranny and now with crime. The other is the Nationalist party, whose chief, but not entire, support is in the southern provinces, and whose chief representative is Dr. Sun. They have clashed in the Chinese Parliament, having elected their president of the Senate, but having just failed, as the last reports received, of having elected the Speaker for the lower house. No perfected constitution has therefore been constructed, and no permanent President of the republic chosen.

Then came the murder of General Sung Chiao-jen, one of the chief Nationalist leaders; it was at first suspected, and then apparently proved by letters and telegrams, that he was killed by direct orders of the Premier under President Yuan Shi-kai and with the connivance of Yuan himself. A preliminary investigation closely implicated them, and then followed the poisoning of the assassin himself, it was believed to shut his mouth. This made a tremendous impression in southern China. President Yuan refused to have a special court appointed to try those accused, and important officials demanded the resignation or removal of the Premier and the President also.

Coincident with this was the conflict over the loan of $125,000,000 by bankers of the five Powers, after the withdrawal of the United States. The loan was agreed to and signed by Yuan and his Cabinet without the approval of the Parliament. The president and vice-president of the Senate and other officials protested vigorously against accepting the loan, and now Dr. Sun has done the same, but President Yuan insists that it was constitutionally done. The Nationalists and Dr. Sun believe that when a third of it when received has been used to pay pressing debts, Yuan will use the rest in strengthening his own power. For this reason Dr. Sun protests to the five nations against paying the loan, expressing the fear of violent opposition and revolt against Yuan; but the first payment was declared, and we do not hear it has been recalled. If paid, Yuan will be likely to win over some of his opponents, but without the money a compromise and peace is likely. The withdrawal of the United States from the loan seems justified.

The gravity of the conditions in China will be increased by the assassination by a bomb last Sunday of General Hsu, a strong supporter of Yuan Shi-kai, doubtless in revenge for the murder of Sung Chiao-jen.

National Board of Fire Underwriters

Several days ago the principal fire underwriting organization of the United States, the National Board of Fire Underwriters, held its forty-seventh annual meeting in New York City. The membership of this body is composed of the principal companies of this country and the representatives of the American branches of the foreign companies, to the total number of about 120, covering perhaps ninety per cent of the country's aggregate insurable value. It is purely deliberative in character, exercises no legislative functions, makes no rates and confines itself to the big fundamental principles underlying the business. If its annual proceedings received from the insuring public the attention their importance merited, the interests of the latter would be substantially enhanced, and many vexatious and expensive problems growing out of unwise insurance legislation would be averted. But when people will not even read the policies they buy and pay money for, of course they will not "waste" one hour a year—the board holds but one meeting annually—poring over the dry discussions of a business organization. More's the pity.

In his annual address, the president of the board, George W. Babb, United States manager of the Northern Assurance Company of London, states that within the year which has elapsed forty-one states have held sessions of their legislatures and that more measures for the regulation of the fire insurance business—a total of about 1500—were introduced than in any previous year, and that some of them, hostile and pernicious in character, became laws. "There are several fatuous ideas," he observed, "which some legislators appear to harbor." Continuing:

"One is that fire insurance companies can practically be compelled by law to do business at a loss. This rests on the assumption that the companies will continue indefinitely to do business at inadequate rates fixt or controlled by the buyers of insurance thru their office-holding representatives. Another is that the usual contract conditions in general use for generations can be eliminated without increasing the fire loss and without increasing the cost of insurance to the great majority who do not have fires."

Here is a point which the average man overlooks in discussing fire insurance. The vast majority of insurants do not suffer loss by fire and every movement having for its object the liberalization of contract conditions increases the burdens borne by the ninety and nine for the benefit of the one. As Mr. Babb says further on:

"A policy is a contract and a restrictive contract, wisely made restrictive in order to safeguard the public generally and make the cost of insurance to careful and honest persons reasonable and non-prohibitive. Statistics indicate that there is about one fire to each five hundred adults. Removal of the restrictive policy conditions sanctioned by long use and many legislatures means an additional premium tax on four hundred and ninety-nine adults out of every five hundred for the benefit of the one who by his negligence, misfortune or otherwise, has had a fire and endangered his neighbor's property, as well as his own. Should such a one in five hundred be encouraged at the expense of the other four hundred and ninety-nine? The countries in Europe answer strongly in the negative and there the loss per capita is about one-eighth of that in the United States."

Coming to the subject of taxation, a compilation of the figures of 1912 for 183 companies shows, calculating on premiums received, less losses paid, that the rate was 5.66 per cent and that calculated on the basis of premiums (without deducting losses) it was 2.66 per cent. As net premiums in the fire insurance business are equivalent to gross sales, less returned goods, in mercantile lines, there is force in the inquiry which Mr. Babb makes when he asks: "I wonder how a tax of 2.66 per cent. on gross sales, less returned goods, would be received by the merchants and manufacturers of the country?"

An examination of the underwriting results attained on the business transacted by 183 companies in 1912 shows a profit of 2.52 per cent of the net premiums written —four one-hundredths per cent less than the tax bill. The average amount of profit per company was $42,320, and the average liability assumed per company was $227,375,444. The aggregate capital represented was $286,783,063, on which the profit shown above equals 2.70 per cent. The total premiums for the year were $307,287,313, the losses paid were $161,917,069, the ex-

penses amounted to $120,783,626, while the increase in liabilities for outstanding losses, unearned premiums and other claims, was $16,842,087. The difference is underwriting profit, $7,744,531. A sum less than eight million dollars on more than three hundred millions handled cannot be regarded as excessive, especially when we consider the risks run by capital in the fire business.

But the ten-year record is not so good. From 1903 to 1912, inclusive, the companies received in premiums $2,550,290,543. The outgo was: losses paid, $1,427,214,115; expenses, $973,030,796, and increase in liabilities $153,413,427; total of losses, expenses and increased liabilities, $2,553,658,-338; deficit for the ten years, $3,367,795, equaling thirteen one-hundredths per cent of the premiums handled. Thus it will be seen that the companies, taken together, have made no money on their underwriting in ten years and have been sustained by the earnings accruing from their invested assets.

Reporting for the Committee on Incendiarism and Arson, Mr. J. J. Guile, United States manager of the Sun Insurance Office of London, stated that during the forty years since the board's arson fund was founded, 6,292 rewards had been offered amounting to $2,085,425, which resulted in 397 convictions at a cost of $84,869.

As previously observed, the work of the National Board is almost academic in character, its great importance consisting in its determination of standards, both as to the ethics of fire insurance practice and in the matter of devices and methods of fire prevention and fire extinction. Commenting on the addition, last year, of another department, that of law, the executive committee says that legislative and legal matters have been dealt with in a broad and thoro manner, welding the influence of the members into a single and powerful force for good—discouraging bad legislation and according vigorous support to that which was wise and wholesome. "Can there be any limit to this progressive work of propagating sound principles and a broader education in fire underwriting science?" asks the committee. Continuing, the chairman says: "Other departments quite as valuable to our business as those now in operation will, I believe, be added until the National Board becomes truly a university for inculcating wide and thoro knowledge of the principles of our most comprehensive business."

Life Insurance Dividends

If the so-called dividend on a life insurance premium does not represent something that has been gained or earned from that source, it cannot by any artifice of argument be regarded as constituting an element of its owner's income. To be specific, if a policyholder's premium is $100, and that sum is made up of the elements, mathematically ascertained, necessary in the payment of current death claims, expenses and reserve, plus the loading for contingencies, the whole amounting to the $100 mentioned, and if at the end of the year the company finds it has remaining in its custody $20 of that money which it wishes to pay back to the policyholder, can that $20 be regarded as a dividend? Isn't it a remnant of the sum he originally paid out on his policy?

Let us assume that this same man buys $100 of building and loan stock, and that at the year's end he receives $20 as a dividend from the building and loan association. What is his position in that case? He still owns $100 of stock and has $20 in cash, a total of $120. The dividend here is an earning and properly falls under the head of income.

The $100 life insurance premium does not, as in the other case, remain as so much capital, but decreases to the amount of the reserve, an element somewhat akin to a savings bank deposit, for it must remain on investment to guarantee the future payment of the policy as a death claim. On what is called an ordinary whole life policy the reserve, increased annually by principal additions and interest accretions, amounts at age 96—the end of life, according to the Mortality Table—to the face amount of the policy.

Here is another proof that a life insurance premium dividend is not income: the life insurance companies which sell non-participating policies pay no dividends to policyholders, but their premiums are from ten to fifteen per cent less than the rates charged by mutual companies. Let us assume that the policyholder mentioned above also carries a non-participating contract, the premium for which is $85. He keeps $15 in his pocket. Is that income?

And yet the Income Tax bill before Congress seeks to include the "dividends" on mutual policies as objects of taxation.

Notes

The fifth annual conference of the Insurance Institute of America will take place on June 10, at Hartford, Conn.

Announcement is made that the Springfield F. & M. Insurance Company will increase its capital to $2,500,000 by declaring a stock dividend of $500,000 on July 1. The present net surplus of the company exceeds $3,000,000.

FINANCE & TRADE

An Interesting Sale of Bonds

The result of New York City's sale, last week, of $45,000,000 of 4½ per cent bonds was awaited with interest by those who were watching the course of the investment market. There were 476 bids, amounting to $76,124,780. The awards ranged from 100.005 upward, and the average of them was 100.159, showing an average income basis of about 4.49 per cent. Several of the largest offers were made at par. All of these were rejected, but nearly all of those above par were accepted. The largest awards were $5,000,000 to Harvey Fisk & Sons, from 100.077 to 100.277; $4,000,000 to the Bankers' Trust Company, 100.013 to 100.380; and $2,500,000 to J. & W. Seligman & Co. at 100.020. The highest bids were those of two women, each of whom obtained $100 at 105. On the following day, at the Stock Exchange, the price fell to 99⅞, but a recovery raised it slightly above par.

Never before has New York been required to pay so high a rate of interest, but in recent months several other cities have not done so well. The great city's bond record is an instructive one. In 1903 New York borrowed about $25,000,000 on 3½ per cent bonds, at income rates ranging from 3.32 to 3.45 per cent. In the following two years, the interest rate was still 3½, but sales averaged only a shade above par. Then the rate was increased to 4 per cent. Sales were not far from par, and the income basis rose, in 1906 and 1907, from 3.65 to 3.99. Two issues in panic times (4½ per cent) may be passed over, as exceptional. In 1909, bonds for $62,500,000 were issued at 4 per cent, the average of sales exceeding par by only a small fraction. Then bonds at 4¼ were sold, $110,000,000 in 1910 and 1911, the income basis advancing from 4.15 to 4.20. In 1912 the rate was still 4¼, for an issue of $65,000,000, sold at 100.74 and yielding an income rate of 4.21.

As the city is not permitted to sell bonds below par, the rate for last week's issue was raised to 4½ per cent. As has been shown, the average of awards exceeds par by only about 1½ per cent and the income basis, which was 3.31 ten years ago, is now 4.49. The city's credit is good, there is an unfailing market for the bonds, and they are to be free from income tax.

Other cities have found it difficult to borrow at the old rates. San Francisco recently could get only a little more than par for 5 per cents. Many instances in the field of bond investment here and abroad might be cited. For an offer of $30,000,000 of St. Paul railroad bonds (4½ at 99½) the bids were only $24,000,000. In London, recently, ten large offerings, in all $138,000,000, have drawn bids for only $14,000,000 from the public. Subscriptions for Brazil's $55,000,000 (5 per cent, at 97) were only $4,000,000. There has been, however, a remarkable oversubscription for the Chinese 5 per cents at 90. But at this price they yield more than 5½ per cent.

There are several causes of the demand for higher yields and of the public's failure to accept new and good issues at rates which were attractive not long ago. In Europe there has been an unprecedented hoarding of money, because of the war and a fear of other wars to come. Moreover, some investors there look forward to highly favorable terms soon to be offered by those who must pay war debts. We do not escape the influence of European monetary conditions. And there is the increase of the cost of living, an increase which has reduced the purchasing power of fixt incomes derived from bonds and thus compelled higher income rates for new issues. Many expect that the world-wide advance in living costs will continue. This expectation tends to restrict investment in long term bonds.

Notes

Japan's new income tax law raises the minimum exemption limit for private incomes from $150 to $200. The rate is graduated from 2 per cent to 22 per cent by fifteen consecutive increases, the highest rate applying to incomes exceeding $50,000. The rate on commercial incomes ranges from 4 to 13 per cent.

An inquiry made by the Department of Agriculture shows that in 1912 American farmers paid an average of 7¾ per cent interest on three to six months loans. Rates by sections were as follows: North Atlantic States, 5.96; South Atlantic, 7.36; Northern Central, east of the Mississippi, 6.38; Northern Central, west of the Mississippi, 8.05; Southern Central, 9.51; Far Western, 8.55.

Dr. George McClellan

A Sketch of an Eminent Philadelphia Physician

By Mrs. Franklin Q. Brown

[Every one who is familiar with the history of medicine and surgery in the United States knows the name of McClellan of Philadelphia. Besides the names mentioned in the following sketch of Dr. McClellan, a great uncle, Samuel McClellan, born in Woodstock, Conn., also became an eminent Philadelphia physician. Both Samuel and George, the grandfather, no doubt received their inspiration for natural science under the elder Silliman at Yale College. It may be added that the grandfather of the two last names was General Samuel McClellan, of the Revolutionary War, whose name is associated with the famous McClellan Elms of Woodstock.—EDITOR.]

The death of so unusual a man as Dr. George McClellan on the 29th of March, 1913, closing, as it does, the record of a very distinguished family in the city of Philadelphia, justifies a further notice of his career and that of others who have borne his name.

Dr. George McClellan, grandfather of the subject of this sketch, came from Woodstock, Connecticut, after graduating at Yale University in 1817, and took his degree as doctor of medicine at the University of Pennsylvania. He was a physician and surgeon of great distinction. Soon after arriving in Philadelphia he married Elizabeth Brinton, whose four sisters married into the families of Coxe, Ingersoll, Phillips and Bishop White. He at once was thus associated with the most influential, intellectually and socially, in the community. The great medical school of the University of Pennsylvania had obtained a world-wide reputation and drew to it students from all over the country in great numbers. The elder McClellan felt that there was need for another medical school in Philadelphia; accordingly with great energy and judgment he brought together able professors and founded the Jefferson Medical College, in which he occupied the chairs of surgery and anatomy, and his work on surgery was in constant use in succeeding generations.

His three sons were all eminent men. The eldest, John H. B. McClellan, followed his father in the medical profession. A third school, known as the Pennsylvania Medical College, was established in his day, and in it he held the chair of anatomy. He edited his father's works and was a contributor to medical literature. During the Civil War he served in military hospitals and was the surgeon in charge of one of these hospitals in the city of Philadelphia.

The second son, General George B. McClellan, needs no mention here. His claim to distinction, both military and civil, is too well recognized to require repetition. As commander of the Northern armies he secured the devotion of the troops as no other general officer ever did during the Civil War. When recalled by Lincoln a second time to the command after the rout of General Pope's army in 1862, the way in which he at once secured order and discipline, and led his army to victory at Antietam was an achievement unsurpast by any commander in the Civil War.

Arthur McClellan, the third son, was an engineer and a scholar of rare ability. He served with distinction on the staff of his brother and later with General Sedgwick, and was standing at his side when that able corps commander was killed. After the war he was engaged with his cousin, Eckley B. Coxe, and his brothers in their great mining works in Luzerne County until his death.

Dr. George McClellan, who has just died, was the eldest son of Dr. John H. B. McClellan, from whom he inherited the preference for the medical profession, and for anatomy and surgery, in both of which his grandfather also excelled. His two brothers were younger, but both died before him, and now upon his death the name ceases in the male line in Philadelphia.

Born in Philadelphia in 1849, he entered the department of arts at the University of Pennsylvania in 1865, and left there in his senior year, in order to matriculate at the Jefferson Medical College, from which he graduated in 1870, and at once began the practice of his profession, devoting himself especially to general surgery. In 1872 he went abroad and pursued his studies at the great hospitals of Paris, Berlin, Vienna, London and Edinburgh. While in Vienna he was deeply imprest by the lectures of Professor Hyrtl, whose teaching of anatomy determined him to follow his methods. Upon his return he was successively elected surgeon to the Howard Hospital, the Philadelphia General Hospital and the St. Joseph's Hospital. His marriage in 1873 to Miss Harriet Hare, daughter of Robert Harford Hare and Caroline Fleeming, and granddaughter of Dr. Robert Hare, of Philadelphia, connected his family with another eminent for its contributions to science.

Dr. McClellan began his career as a teacher at the Pennsylvania School of Anatomy and Surgery, established by him in 1881, where he taught for twelve years and first developed his talent for free-hand drawing, with which he illustrated his lectures. This talent, his anatomical knowledge and love of art, led to his election as professor of anatomy for art at the Pennsylvania Academy of Fine Arts, where he lectured for twenty-three years. In 1906 he was elected to the chair of applied anatomy at the Jefferson Medical College, which professorship he held at the time of his death.

While conducting the lectures at the

Pennsylvania School of Anatomy he began the painstaking and detailed series of dissections which formed the material for his work on regional anatomy, published in 1894. This publication was an innovation in scientific illustrating. Anatomists up to that time had supplied their works with artists' drawings. Altho these were beautifully executed and carefully compared with actual dissections, they never could be quite free from diagrammatic features. McClellan conceived the idea of employing photography, in order to eliminate as far as possible this diagrammatic element. He, therefore, made a study of photography with the same care and earnestness which characterized all his undertakings. In the course of his studies of photography he obtained results with other than scientific subjects, which are beautiful examples of artistic effect and photographic knowledge. Among these, his photographs of moving birds and horses portray many important facts regarding the position of animals in motion. The large number of dissections personally executed by him and requiring years in accomplishment, were then photographed with all the knowledge acquired in his thoro study of this subject. Only one who has dissected can appreciate what a work this was. His accurate knowledge in anatomy and skill in photography, made him discard many hundreds of failures before he obtained the results which make his *Regional Anatomy* unique in the field of anatomical writings. This book passed thru four editions in the United States, where over fifteen thousand copies were sold. It was translated into French and passed thru two editions in Paris.

Altho McClellan employed photography in the illustration of his work on anatomy, his ability as an illustrator would have enabled him to produce drawings of his dissections equal to and in some respects excelling those found in works of this nature. It is an evidence of his scientific search for the truth that he employed photography in preference to the possibly erroneous reproductions of an artist's pencil. This gift he employed, however, in his lectures. The student of anatomy saw before him the dissections, and as the lecturer with exceptionally simple and lucid language explained these, he built the structure up by a free-hand illustration in colored crayons, which, when complete, supplied the student with a perfect résumé of the subject under discussion.

Lectures on anatomy seem to most students only a succession of difficult names and facts to be dug out later by equally difficult reading, but in McClellan's lectures, as the scheme gradually unfolded, the listener felt himself taking each step with the lecturer. No instructor ever more completely held the interest of his pupils. The secret of the successful teacher was here manifest. McClellan thru the aid of his power of illustrating his subject stimulated the student to think for himself, and that he succeeded was evidenced by the stillness of the listening classes, as they leaned from the tiers of benches about the lecturer.

Comparing his lectures on art with those on anatomy, one is struck with his nice appreciation of the relative position of the two spheres. In the Academy of Fine Arts' lectures, art was always the keynote, and he eliminated all those purely technical anatomical minutiæ which do not affect the outward form. In his medical lectures, detail accuracy was the dominant feature. In both he made use of the living model, on which to point out anatomical landmarks, supplementing this in his medical lectures with demonstration on the cadaver. His work on anatomy in its relation to art was published in 1901 and his method of illustration of his subject in this instance was also original, as the skeleton was first depicted in the position required for each figure represented, whether one taken from the antique, or merely suggested from modern every day life—the skeleton was then clothed with flesh, the nude figure being placed in the same position, and finally it was represented with appropriate drapery.

Besides his books on *Regional Anatomy*, and *Anatomy in Its Relation to Art*, he wrote the *Anatomy of Children* in Keating's Encyclopedia of the Diseases of Children, and such other scientific papers as *A Study of the Effects of Shock*, the *Repair of Wounds*, etc., and on practical surgical subjects as the *Treatment of Carbuncle by the Sponge Dressing and Pressure*, and the *Uses of the Antiseptic Moist Sponge Dressing in Amputations of the Joints*. He also invented a valuable surgical needle. In miscellaneous writing he produced a number of papers on various subjects, an amusing sketch among others of the life of George Frederick Cook, the actor (whose skull had been presented to him by the famous Dr. Francis) called "The Strolling of a Player's Head," a life of Dr. Physic, and a short biography of his own grandfather.

Besides holding the chairs of anatomy at the Academy of Fine Arts and at Jefferson Medical College, Dr. McClellan was a member of the Association of American Anatomists, of the Academy of Natural Sciences, of the Academy of Surgery, of the Medical Club of Philadelphia, of the University Club, the Contemporary Club, vice-president of the Philobiblon Club, consulting surgeon to the Howard Hospital, and lecturer on anatomy at the Pennsylvania School of Anatomy and Surgery.

He died on March 29, 1913, after a three days' illness, retaining consciousness and the use of all his faculties to the end. The large attendance of students at his funeral was the best evidence of their appreciation of him, and the representative men in all walks of life who filled the church attested the high respect in which he was held. The loss of such a man, and the extinction of such a family, is indeed to be deplored.

The Maintenance of a Good Name

Mr. Roosevelt's suit for libel has ended, as all his friends knew it must end, in the utter collapse of the attempt to prove the ex-President of the United States to be an intemperate man. Mr. Roosevelt knew of the gossip which declared him to be a drunkard—we hate to use the word—and he had determined to meet it and absolutely disprove the story while he lived; and he had watched for a good chance to do it. There were innuendoes a-plenty, but it was not so easy to find a case of absolute libel that would allow a legal prosecution. Such a case was found in Kansas, but the publisher of the journal was an ex-United States Senator whom Roosevelt's Administration had indicted and sent to the penitentiary, and Mr. Roosevelt did not wish to seem to be persecuting him. Then came this plain case in Ishpeming, Mich., and Mr. Roosevelt seized on it, and determined to do the task thoroly of clearing his reputation. His acquaintances flocked about him. They covered his whole life. They proved that he was perfectly sober on the occasions of which gossip had spoken. When his witnesses had given their testimony the defendant frankly confest that he could find no witnesses to prove his charge, and that he was fully convinced that he had erred. Then Mr. Roosevelt said this was all he wanted, and that he asked only nominal damages; and the judge, whose conduct of the trial deserves all praise, directed the jury to give a verdict for the plaintiff, with six cents damages. So gossip was lightly punished and yet Roosevelt fully vindicated.

Mr. Roosevelt did wisely in searching an opportunity to assure the maintenance of his good name after his death. He knew that such stories of habitual intoxication had followed other famous men, even Presidents, and he had warning enough of such malicious stories being told about him. Even yet men discuss whether Daniel Webster did not try to make speeches when drunk, and most people believe it. No one ever charged President Hayes with intoxication, for it was known he was a total abstainer; but this has been said of President Johnson and President Grant, and their names have never been fully cleared of the charge. Mr. Roosevelt owed it to himself, to his family, and to history to make his name clean and clear to the ages, and he has done it fully, and it is proved that he has never been under the influence of liquor, and also that he has never been known to be profane or foul in familiar conversation.

The explanation of these false stories about Mr. Roosevelt seems to be in part the strenuous emphasis of his language at times, which weaker men imagined was because the wit was out when the wine was in; and in part because on his speaking tours he was hustled thru a crowd by men supporting him on each side, for his protection, and again suspicion imagined that it was because he could not walk straight. It was all silly, but it spread, and his enemies easily believed it. Now no bit of the stain remains on his personal character, and we are very glad, and the country is glad. We never believed it, and any one who now believes it does it wilfully out of an evil heart.

Tho chaste as ice and pure as snow, one cannot escape calumny. There is an old and forgotten bucolic proverb which says, "You can't prevent the birds from flying over your head, but you must not let them nest in your hair." Mr. Roosevelt has acted on this warning, and the foul birds of slander must henceforth keep out of reach of his head.

A Tariff Lobby

Because of the President's assertion that extraordinary exertions were being made in Washington by a numerous, industrious and insidious lobby, to cause changes in the tariff bill, a searching investigation is to be made by a Senate Committee. Every Senator is to be questioned, and in a few days we shall have their testimony as to the persons who have appealed to them and also concerning their direct personal interest, if any, in the proposed legislation. This is as it should be. There ought to be an investigation. Let the truth be brought out.

We do not understand that Mr. Wilson used the word lobby in its common and most offensive sense. He did assert that money without limit was being spent to sustain the lobby of which he spoke, but the dispatches say that in conversation with press correspondents at the same time he explained that he did not charge that the lobby was acting corruptly by using money to influence legislation directly. It was guilty of misrepresentation, he added, by advertisements, published arguments and otherwise.

We think the tariff rates should be reduced and that, with respect to a large majority of its provisions, the pending bill is a good one. It makes great changes, however, in duties which have affected, and still affect, many branches of industry. It is natural that manufacturers who believe, as a considerable number do, that their interests would suffer by reason of the changes, should strive to protect themselves by argument and appeal to members of the Senate. This is legitimate action. There is no corruption in it. But they, or their agents in Washington, may appear to be a lobby. It is not charged, so far as we can learn, that they are using methods which are dishonest or wicked.

It appears that the most earnest and diligent of those who are called lobbyists are the representatives of the beet and cane sugar industries in this country, and of the cane sugar growers in Hawaii, Porto Rico and the Philippines. They are supported in their work by money which the growers have contributed. There is reason to believe, as we have shown heretofore, that the provisions of the pending bill, if enacted, would subject these industries to blight, if not to complete ruin. It has virtually been admitted by the legislator whose name is attached to the bill that the cane sugar industry in this country would be eliminated by free sugar. The beet sugar industry, one of great promise, would be crippled, if not destroyed. Hawaiian and Porto Rican producers of sugar have sent agents to Washington, asserting that the projected legislation would cause great and irreparable injury in their islands. We think there is ample warrant for their action. In return for this crippling or blotting out of industries in which a great number of people are directly interested, we should have a slight reduction of the cost of sugar, or, perhaps, no reduction whatever, and should lose, moreover, $50,000,000 of yearly revenue.

Probably the opponents of the sugar provisions of the bill—provisions in which the President has shown a deep personal interest—are the most prominent and active members of what has been called the lobby. Surely, however, they are engaged in a legitimate movement. They are striving to save from blight or destruction the industries in which they and the people whom they represent make their living. Lobby does not seem to be an appropriate term for the committees from Hawaii, Porto Rico, Louisiana and the beet sugar fields and factories.

But the investigation is in progress, and the whole country will soon know who the lobbyists are. It will also know what their methods and arguments have been. If in these methods there has been anything like corruption and lying, anv dishonesty, we hope it will be exposed, in order that the guilty may suffer the denunciation of public opinion, at least, if nothing worse.

Government by Committee

No one who has studied the processes of Congressional legislation can fail to have observed the ambition of members of the House and Senate to be on a very few important committees which actually direct and control legislation. We are ruled by Congress and Congress is ruled by its committees.

The evil and danger of this system is well exprest by ex-Secretary of War, Henry L. Stimson. He said in a late address:

> Tremendous powers are exercised in secret and by men who, neither as committeemen nor as Congressmen, are responsible to the country at large. Congress is at the mercy of any individual or private interest which can get before any of these committees, and on an ex parte hearing impress the committeemen with the desirability of an appropriation. Such legislative methods simply invite demands for improper favors.

This evil exists and should be corrected. The two remedies offered by President Taft, and supported by Mr. Stimson, are, first, the right of the President to present annually to Congress a budget of expenses found necessary. Appropriations not asked for will be presumed unnecessary and will have a slim chance of being added. But they can be added, of course, just as those asked for can be reduced in amount or increased. With this should be the right of the President to veto items in an appropriation bill, a power constitutionally given to the Governor of New York. With such a right of veto the chance of "improper favors" in the pork barrel bill, by give-and-take in the committee, would be greatly reduced. For this power to veto items in an appropriation bill Presidents have long asked, and we have had a notable instance of the need in the last hours of the last session, when President Taft was compelled to veto an entire bill because it included a clause forbidding an appropriation to be used to punish certain illegal acts.

The other needed reform, which President Wilson much desires, is the right for Cabinet officers to address Congress in both houses, in support of or opposition to proposed legislation. As it is, committees can secretly agree upon and secure legislation without proper supervision by the public. Whatever appropriation is proposed, some Cabinet officer is closely interested in it. Let him speak publicly on the floors of Congress, and the public knows of it. Special attention is called to its need or needlessness. This right the members of the British Cabinet use to great advantage, and so much is it valued that the Cabinet officers must be members of Parliament. That is not necessary with us, but their right to present the budgets and then to defend them, and to oppose extravagant appropriations covers the reform needed. Congressmen themselves would like it, for it would tend to equalize their power.

Milk Punch and Statesmanship

Was it Mr. Roosevelt himself who described his favorite tipple—a glass of milk diluted with a teaspoonful of brandy—as "milk punch"? If so, a shudder must have passed over the faces of all the cow-punchers within hearing of the court. Without claiming expertness in this field, we have a literary knowledge of it, and find in a certain work of reference this recipe for the beverage discussed:

> Yellow rinds of two dozen lemons; steep for two days in two quarts of rum or brandy; then add three quarts more of spirits and the same amount of hot water; one quart of lemon juice and four pounds of loaf sugar; grate two nutmegs; add two quarts boiling milk. Mix, and in two hours strain thru a jelly bag.

This concoction suggests a session of Gargantua rather than any potion prescribed for Mr. Roosevelt by Surgeon-General Rixey.

A member of THE INDEPENDENT staff overheard an enlightening conversation aboard the Congressional Limited last June, en route from New York to Baltimore. The car was crowded with delegates to the Democratic Convention and others, and Speaker Clark was the car's choice for the Presidency. "This feller Wilson is a schoolmaster," said one of the Manhattanites. "The Speaker knows the practical end of the game. Now, my work lets me feel the public pulse—I own a saloon—and I want to ask you a question about this Presidential business. If I was goin' to get a new bartender, would I take a feller who'd studied a book called *How to Mix Drinks*, or

would I find one who'd stood up and shook 'em together and knew how to give a customer what he asked for without necessarily wastin' all the ingredients called for in the book? Which one do you suppose, now?"

But the country chose the schoolmaster, and the anecdote is published here, not to reproach Speaker Clark for having a saloonkeeper among his numerous friends, only because we believe barkeeping and statecraft to be as far removed from one another as are the deft manipulator of "two quarts of rum or brandy," and temperate Mr. Roosevelt—with his occasional teaspoonful of milk-drowned cognac.

The Treaty with Nicaragua

President Wilson has decided to support the treaty negotiated with Nicaragua by President Taft and ratified by Nicaragua in February last. This treaty was pigeonholed in the Senate. It was said to be a manifestation of that so-called "dollar diplomacy" which the new Government could not approve. In fact, however, it was an agreement of great merit and value. We are glad to be assured that Secretary Bryan realizes the importance of it and has exprest to members of the Senate Committee on Foreign Relations his hope that they will promote its ratification.

Under this agreement the United States gains an exclusive right to construct an interoceanic canal in Nicaragua and acquires a naval station in the Gulf of Fonseca. Our Government is to pay $3,000,000, and the money is to be used in Nicaragua for public works and public education. It will be recalled that the route for a canal across Nicaragua (by way of the great lake) was surveyed by engineers of our navy years ago, the leader of them being an uncle of General Menocal, the new President of Cuba. In all probability the United States will never construct a canal there, but, with this treaty in force, there will be no more gossip about the plans of some European nation for making one or for obtaining a concession for one. Such gossip has raised hopes in Central America and been used in the interest of revolutionary factions.

At the proposed naval station there is one of the finest harbors on the Pacific coast. The area of the gulf is more than 1000 square miles. The shore line includes parts of Honduras and Salvador. We shall need such a station and such a harbor for our fleet after the completion of the Panama Canal. And a naval station of the United States there will tend to preserve peace in the three republics whose lands touch the gulf. In the vicinity of the site chosen for the station many revolutionary plots have been hatched and many revolutionary bands have assembled. It has been easy to cross boundaries there, to excite the hostility of one republic against another, or to seek protection in one when it could not be found in another. It is a strategic point of much value, with reference to the Canal and also as affecting the interests of Nicaragua, Honduras and Salvador.

We hope the treaty will be ratified at Washington. And when the Senate has the subject under consideration it should look again at the loan convention with Nicaragua, which was laid aside some time ago. The ratification of that convention is needed for the development of Nicaragua and the promotion of good government there.

Owning an Auto

The economics of automobile ownership are interestingly dealt with by Mr. Albert L. Clough in the article, elsewhere printed, entitled "Can I Afford an Automobile?" The query is one that is not always frankly considered by the man with a fixed income before he indulges his longing for a machine to whisk him over the country roads.

Taking Mr. Clough's conclusions and translating them into Arabic numerals, so far as it is reasonably possible to do so, what do we find to be the unescapable expense of owning a modest car, for pleasure purposes, that costs, let us for convenience say, $1000?

Conditions are so various that exact figures cannot be given. The owner must pay certain New Jersey costs, for example, which in Massachusetts he might escape. Several of the items may not apply to some owners, but there are like-

ly to be items not mentioned which are a tax upon the owners who escape any of these. Therefore, let us assume that this estimate of annual cost is fairly correct:

Depreciation on first cost of $1000, 20 per cent per annum	$200.00
Interest on cost, 6 per cent	60.00
Operation and ordinary repairs, 10 cents per mile, 5000 miles	500.00
Registration fee, say an average of	10.00
Taxes on $1000	20.00
Insurance (fire, accident, casualty)	30.00
Depreciation on garage costing $250	25.00
Interest on cost of garage	15.00
Minimum annual cost	$860.00

This estimate does not include accidents, and every accident will cost the owner more than he will get from the insurance company. It includes only ordinary tire troubles and wear, and the chances are that tires will "go bad." It takes no account of auto "toggery" for the owner and his wife. It does not recognize such incidentals as lunches and garage and hotel charges en route. It does not contemplate engine troubles. It does not provide for the cost of accessories. In fact, there are so many probable items of expense not reckoned that it will be reasonable to assume that the man who buys a thousand-dollar auto should provide for an annual expenditure of a sum equal to the first cost of the machine. But this estimate will be regarded as high by some makers, who reckon that annual operation and upkeep will not exceed 50 per cent. of original cost.

These figures do not represent the irreducible minimum. It is possible to buy an auto for less than $1000. It is possible that in some instances operating expense may be less than 10 cents a mile. Indeed, one very well known maker of high class autos figures on an expense of but $80 for a run of 5000 miles, exclusive of repairs. Insurance may be cut out. The machine may be so housed as to make a garage unnecessary, or a garage may be built at from $50 up, etc. But these possible savings of actual money expense are not savings that can be reckoned as probable under ordinary normal conditions. Probably no two men would figure expenses alike. But it is not safe to anticipate that owning an automobile can be made much more economical than the table indicates, allowing proportionate increase or decrease as the machine bought is higher or lower priced.

What classes can afford this expenditure? It means $19.23 a week if the annual cost is $1000. If the owner can keep his expense down to $860, the weekly proportion will be $16.54. This is the question for the man with a fixed income to answer, before he buys an automobile, if he values economic peace of mind.

Peace and War in the East

It is no wonder that the conference of the Ambassadors in London was impatient to have peace formally concluded between Turkey and the four allied nations. The war was ended, and yet the allies were slow to make peace. Finally, as Sir Edward Grey insisted, the little nations, which now think themselves so big, came to terms one by one; Turkey was willing enough.

But vastly more important is it that the Ambassadors should urge and insist on peace between the allies themselves. If they want to fight, the European nations should pick up the four fighting-cocks, one by one, put a hood over their eyes and take them home. And yet it was fated that when it came to dividing the Turkish spoil they would quarrel among themselves. So it has been of old. For many years Greece and Bulgaria have been quarreling over their respective rights in Macedonia, and they have hated each other, as good Christians do, worse than they hated the Turk. And Bulgaria and Servia have equally been at swords' points, with Servia getting the worse of it. Good Christians, they banded like thieves and quarrel like thieves. It now looks as if Bulgaria were to have two to fight at once, Grece and Servia. Why should they not make up and be friends? Why can they not choose umpires to make a fair division of the territory acquired by the combined bravery and military genius of the four allies? Have they not lost lives enough? Must they make more widows and orphans? Are they not Christians? It is atrocious that they should now turn to ravage their own land and slay their own brothers. If they cannot agree on arbiters, let them go to the Hague Court; that is what it is for.

But if they will not agree to arbitrate, then let the major Powers of Europe put their foot down hard. We would have them more insistent than on the matter of concluding the peace with Turkey. The good time is not far off—and this might hasten it—when the Federation of the World will have laws enough and police enough to put a stop to public brawls between nations.

A Canadian Fiasco

Canada was so British that she would not accept the reciprocity treaty with the United States, fearing that it would tie her closer to this nation and weaken her attachment to the mother country. She would rather forego the advantage of cheaper products, and pay her money as a gift to England in the way of dreadnoughts. But, strange to say and sad to say, she now refuses to keep her promise to spend $35,000,000 on dreadnoughts to be built in British shipyards, and kept on the other side of the ocean. The Dominion Commons voted the money, tho by a reduced majority, but the Senate positively refuses the scheme, demanding that it must first receive a popular vote of approval.

But who believes that the people would approve? Certainly the Liberals will not; and certainly the tens of thousands of American farmers who have sold out their farms at high prices and bought larger ones for less money in Western Canada will not; and the Swede and Russian immigrant voters will not; and the Socialists will not; and we may be sure that Premier Borden will not dare to appeal to the people. The proposal is dead. Canada's patriotic offer spurred Australia and New Zealand to keep their promise, and they have kept it, and kept their cruisers and other smaller naval craft in their own waters, but rich Canada defaults. The people never would have approved it. It was the scheme of politicians, for political glory at home and in England.

Canada is not European nor British, but American. Her interests are in America, as are ours. Her commerce must be principally American, and chiefly with the United States. It is for her interest and ours that there should be the least possible interference with trade between the two countries. We have the same currency. Only an imaginary line separates us for three thousand miles. A man can walk, or sail across lake or river, anywhere, and not know when he passes from one country to the other. The railroads join the two lands, and the junction we learn when the customs officer comes aboard. The less we have of him the better. This does not mean that we will make the least effort to detach Canada and seduce her into a political union with us; but it does mean that we want the closest unrestricted commercial union and fraternal fellowship. We are glad Canada does not want to waste her good money on warships; better spend it on railroads. Better open up more land. Better draw over more of our farmers, whom we do not want to lose. Better reconsider the old refusal of reciprocity and inaugurate fresh negotiations.

Presbyterian Union in Scotland

The negotiations for the union of the United Free Church with the Established Church of Scotland, both Presbyterian, proceed hopefully. This is somewhat surprising, for the Established Church, the Old Kirk, has special recognition from the state, as has its sister Established Church in England and Wales, while the United Free Church is itself the union of the United Church and the Free Church of a few years ago, both rebels against state interference.

The one condition of the proposed union which seems to satisfy the commission of the United Free Church is the definite assertion that the state shall have absolutely no control. In England it does have control. The state appoints bishops and archbishops, but in Scotland will appoint nobody. This is well, but we fail to see the propriety of the Church seeking and valuing the mere show of recognition and honor which the Old Kirk holds so dear. They ask for that "consuetudinary recognition by the Crown which the Church of Scotland values." But why value it? Would not other denominations—for example, the Scotch Episcopalians and Scotch Catholics—value it as much? Why make a

state show of the sessions of this Church's General Assembly, and not have the Crown do as handsomely by Catholics and Episcopalians? Only because the Church of Scotland is bigger and can make a louder demand. To us it does not seem fair that one big church should have even the least recognition in the way of honor or show that is not given to those that are smaller. They say they ask for no peculiarly privileged position; but any special recognition whatever is a special privilege.

Of course, it is very desirable that this new union should be consummated. Such a Church would be a very great power and exercise a profound influence for good. But let its grandeur be its own advantage. The utter separation of Church and State is desirable in Scotland, as well as in Ireland and Wales.

The Henrico Plan

It was in Gloucester County, in Virginia, that what is called the Henrico plan of extending industrial education in the colored schools of the state was started by Hampton Institute. It now covers vacation time as well as term time, improves schoolhouses, lengthens terms, is extended to other states, and is being adopted in white schools as well as colored, and paid for out of public funds.

In 1907, Mr. Jackson Davis, superintendent of schools in Henrico County, anxious to improve the twenty-three negro schools within the county, visited Hampton and learned of some extension work done by Hampton Institute in Gloucester County, where a young woman had been sent to visit the schools and help the teachers adapt their work to the needs of the people. The plan pleased Mr. Davis, but he had no funds to do the work. Then the Jeanes Fund for Negro Rural Schools, just established, with Dr. James H. Dillard in charge, was appealed to and he approved the plan and determined to develop it. A young woman was appointed supervisor for the county. She called the parents to the schoolhouses and organized them into improvement leagues, and they repaired floors and windows, scrubbed the walls inside and whitewashed or painted the outside, made walks and set out flowers. The girls were taught sewing, cookery, mat-making, etc. The plan spread until it was inaugurated last year by the Jeanes Fund in 119 counties in various states, in coöperation with the county superintendents. Twenty-five counties in Virginia have adopted it, and Virginia appointed a state supervisor of such school work, and Kentucky, Alabama and Arkansas followed.

The county supervisor begins with forming clubs to clean up the school yard and school house. She gets up entertainments to raise money for the improvements and to lengthen the school term. Then she teaches sewing and other industries. Then comes the long vacation! She forms the girls into garden clubs and teaches them how to can fruit and vegetables. This began in the summer of 1911 in four counties, with Hampton offering to provide cans and buy the product. But Hampton did not have to provide cans and bought no product, for the girls and their mothers in eight counties last summer put up nearly ten thousand cans and kept them for home use.

There were last year 299 schools regularly visited; 121 had lengthened their terms by a month; 348 improvement leagues had been started, and—curious to tell—besides repairs and painting, 102 schools used individual drinking cups. All this is done with the aid of the Jeanes Fund and the General Education Board, but under the direction of the public school authority. The improvement is so marked that last year seven Virginia counties began the same work for white schools. There was to be a conference of the supervisors of colored schools in Hampton, and the General Education Board invited the state superintendents of public instruction in all the states to be present. Eight of them came, and attended the conference of the county supervisors, white and colored.

This is a movement which affects both races alike. It especially is directed to the women, but is in relation to the farm demonstration work carried on by our Department of Agriculture for the men. It is rapidly spreading over the South, as it begins to be supported by state funds, and its success depends on the sympathy of the white superintend-

ents and school boards. On such work prosperity and uplift must rest. It is a woman's work, and what women insist upon will be done. *Dux femina facti.*

More Peace Treaties

Eight governments—those of Great Britain, France, Italy, Russia, Sweden, Norway, Brazil and Peru—have exprest their willingness to consider hopefully a peace treaty proposed by the President. It is a very simple proposition, and any two nations which accept it merely agree not to go to war until any case of difference has been referred for consideration to an international commission which shall within a given time make report and give advice. This advice may or may not be accepted, but no war shall be suddenly made and there will be time for passion to cool.

Observe that this plan covers all kinds of difficulty, even those called questions of honor. It is peculiar to it that it binds neither party; but advice after full investigation by impartial judges would be almost certain to be followed. Even jingoes would be cooled and calmed by the delay. It will be a real triumph for Secretary Bryan if he is able to negotiate such treaties and then persuade the Senate to approve them. Nevertheless, the more peace is assured the more desperately will the army and navy leagues and boards demand fortifications and fleets.

Teaching Morals in Philippine Schools

The Philippine Islands are under the control of the War Department, and it is thus the business of its officers to teach morals in the public schools. Teachers are forbidden to teach either religion or politics, which is a right rule. The teaching of religion belongs to parents and to the Church. It would be the occasion of constant wrangling if this rule were not enforced.

But morals can be taught to the Philippine youth in the public schools as well as in this country. The Philippine Board of Education in Circular 143, s. 1910, gives instruction to teachers how they should teach manners and morals. It begins with cleanliness and care of the person, with considerable minuteness. Then follows table manners, with specifications of ill manners; then conduct at home, and proper courtesy to parents and guests; then conduct at school, politeness to teacher, politeness of boys to girls, and the meanness of bullying or tattling; then conduct in public, no loud talking and no eating on the street, no chewing of gum, never lie—it's mean and cowardly; then kindness to animals; and then the dignity of work.

The more general law of morality is thus admirably laid down for teachers:

> The law of the Golden Rule, "Do unto others as you would have others do unto you." Teach the meaning of such suggestive adages as "Put yourself in his place," "A kindness is never lost." The whole trend of this teaching should be in the direction of impressing indelibly upon the mind of the pupil that every person is only one of many; that no one person can be a law unto himself; that no person can live a rational life unless he makes his actions conform to the principle of seeking the common good of all members of the community; and that the only real happiness to be attained is derived from living an unselfish life—a life replete with deeds of kindness and consideration for the rights of others. All community life really amounts to an exchange of courtesies. No one has a right to expect fair treatment from the hands of others unless he accords fair treatment to them.

This is not religion exactly, but there is no true religion without it. It begins with the Bible, and it emphasizes what Jesus Christ emphasized. But we must quote a somewhat sterner teaching:

> Every person owes it to himself to live and regulate his conduct in such a way that his private life would bear inspection. To be one thing and to appear to be another—in other words, to live a lie—is a base deception. Teach the meaning of the quotation:
> "This, above all: to thine own self be true;
> And it must follow, as the night the day,
> Thou canst not then be false to any man."
> Also the meaning of "Be sure your sin will find you out." The severest punishment a person can undergo is the disapproval of his conscience. It is less terrible to be put in prison than to have to suffer self-condemnation. The highest reward that can come to a person as a result of right conduct is the consciousness of the fact that he has done well and that he has lived up to his mission in life.

These are the instructions that Philippine teachers, American and native, are required to give their pupils, and in

English. That is a good seed-bed for the sowing of religious lessons in the Church. It magnifies duty, not glory. And the circular concludes with a long list of the "qualities that go to make up the ideal character and which every person should try to attain," such as cleanliness, courtesy, charity to the unfortunate, diligence, patience, thoroness, honesty, modesty, amiability, generosity and resignment; with a corresponding list of "qualities that characterize the low-bred person and which all should seek to avoid," such as—to instance a few out of the thirty vices—filthiness, immodesty, discourtesy, selfishness, covetousness, cruelty, quarrelsomeness, lying, dishonesty, vanity, foppishness.

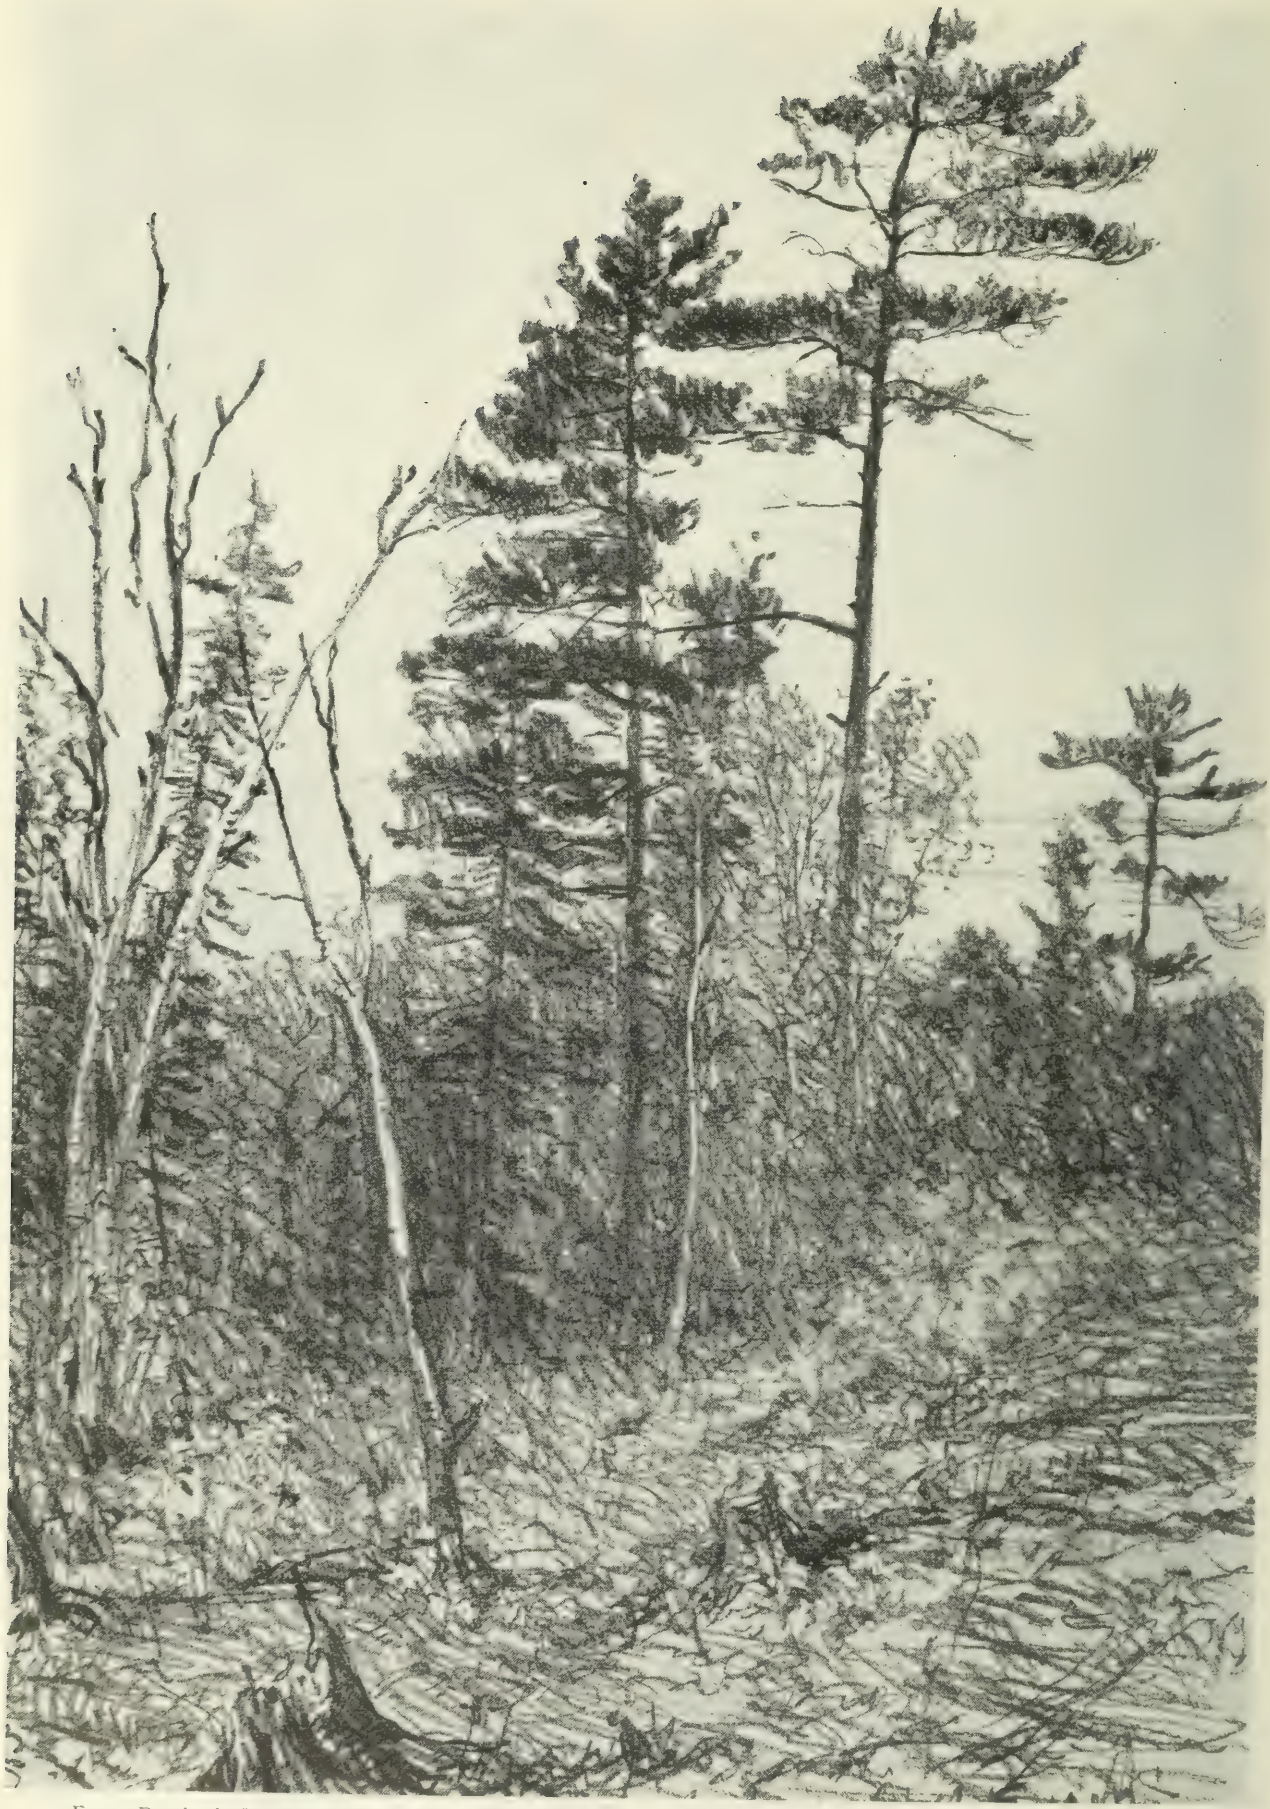
This little pocket manual of manners and morals might well be reprinted by our school boards for the guidance of teachers here at home.

In Brief

What is an undesirable citizen? We remember that once the Irish were thought the most undesirable citizens and a strong political party was created to shut them out. Now they are exempt. Just now it is Italians, Hungarians, Chinese and Japanese that Senator Dillingham's bill would exclude. It shuts down the gate abruptly when one-tenth as many have been admitted from any country in any one year as have already been admitted. If they were slaves those shut out would be worth a thousand dollars apiece. Free men ought to be worth as much. With all our vacant spaces and our falling birth rate, it is folly to exclude healthy and decent immigrants. It is yet to be proved that Italians and Japanese have not as good brains as Anglo-Saxons or Teutons.

The announcement is positive, but will yet need confirmation, that two Italian physicians have, after long investigation, found the cause of the disease called pellagra, which occasions so much suffering and death in Italy. Fifty thousand cases appear each year. They make the surprising announcement that the cause is drinking water of certain streams that contains silica in colloidal solution. Silica is the same as quartz or flint, and it is soluble in certain alkaline waters at a certain temperature. It is likely that when taken into the system this soluble colloid silica would become insoluble and dangerous. If this explanation proves true, Italians may no more fear to eat maize, which has been charged with the evil. It will set our physicians to studying American pellagra from a new standpoint, for they say that pellagra appears in very many cases, and in a majority of our states.

The Friedmann cure for tuberculosis has suffered a severe blow by the action of the Board of Health of this city. Any further use of it is forbidden until its advantage has been fully confirmed. On the contrary, evidence shows it to be an injury. The report accompanying the action says the tests made are "unsatisfactory, unscientific and practically futile," while "the so-called remedy not only does not fulfil the promises of efficiency and safety," but "many patients have suffered serious and unduly rapid progress of their disease." That million dollar Friedmann company will probably have to give up business. We gave our warning weeks ago.



The addition of collections to the value of fifty million dollars to the loan exhibition of the Metropolitan Museum, from the estate of the late president, Mr. J. Pierpont Morgan, is an event of prime importance in the history of American art. They will fill an entire wing to be soon built, and will be temporarily installed otherwise early next year. It is worth while to have such a president, and we sincerely hope that the loan will become a gift from the son, who is the sole owner and who inherits his father's passion for art.

There is one radical solution possible for the Japanese trouble, and that is for the United States to change its policy and allow naturalization for yellow and brown men, as well as for white and black. Then if the yellow and brown prove superior, so much the better for the country. The superior should control. But we yet believe we are not inferior.

The Irish home rule bill has not yet become a law, and already a private member has introduced, with the good will of the Liberal Government, a bill for home rule for Scotland, and it has past its second reading. It is bound to come, but not in this Parliament, which will probably achieve home rule for Ireland.

A daughter of Ambassador Leishman is to marry a German high nobleman, but the authorities in German etiquet agree that they can give her no nobility in addition to the American nobility she brings to the altar. So we believe.

An Austrian colonel is found to have sold military secrets to Russia. He is given a pistol and advised to blow out his brains and he does so. Thus military honor is maintained.

"AT FIRST IT SEEMED A SOMBER STORY."

Tongues in Trees

An Artist's Pilgrimage to Canadian Forests

By Kerr Eby

With Illustrations by the Author.

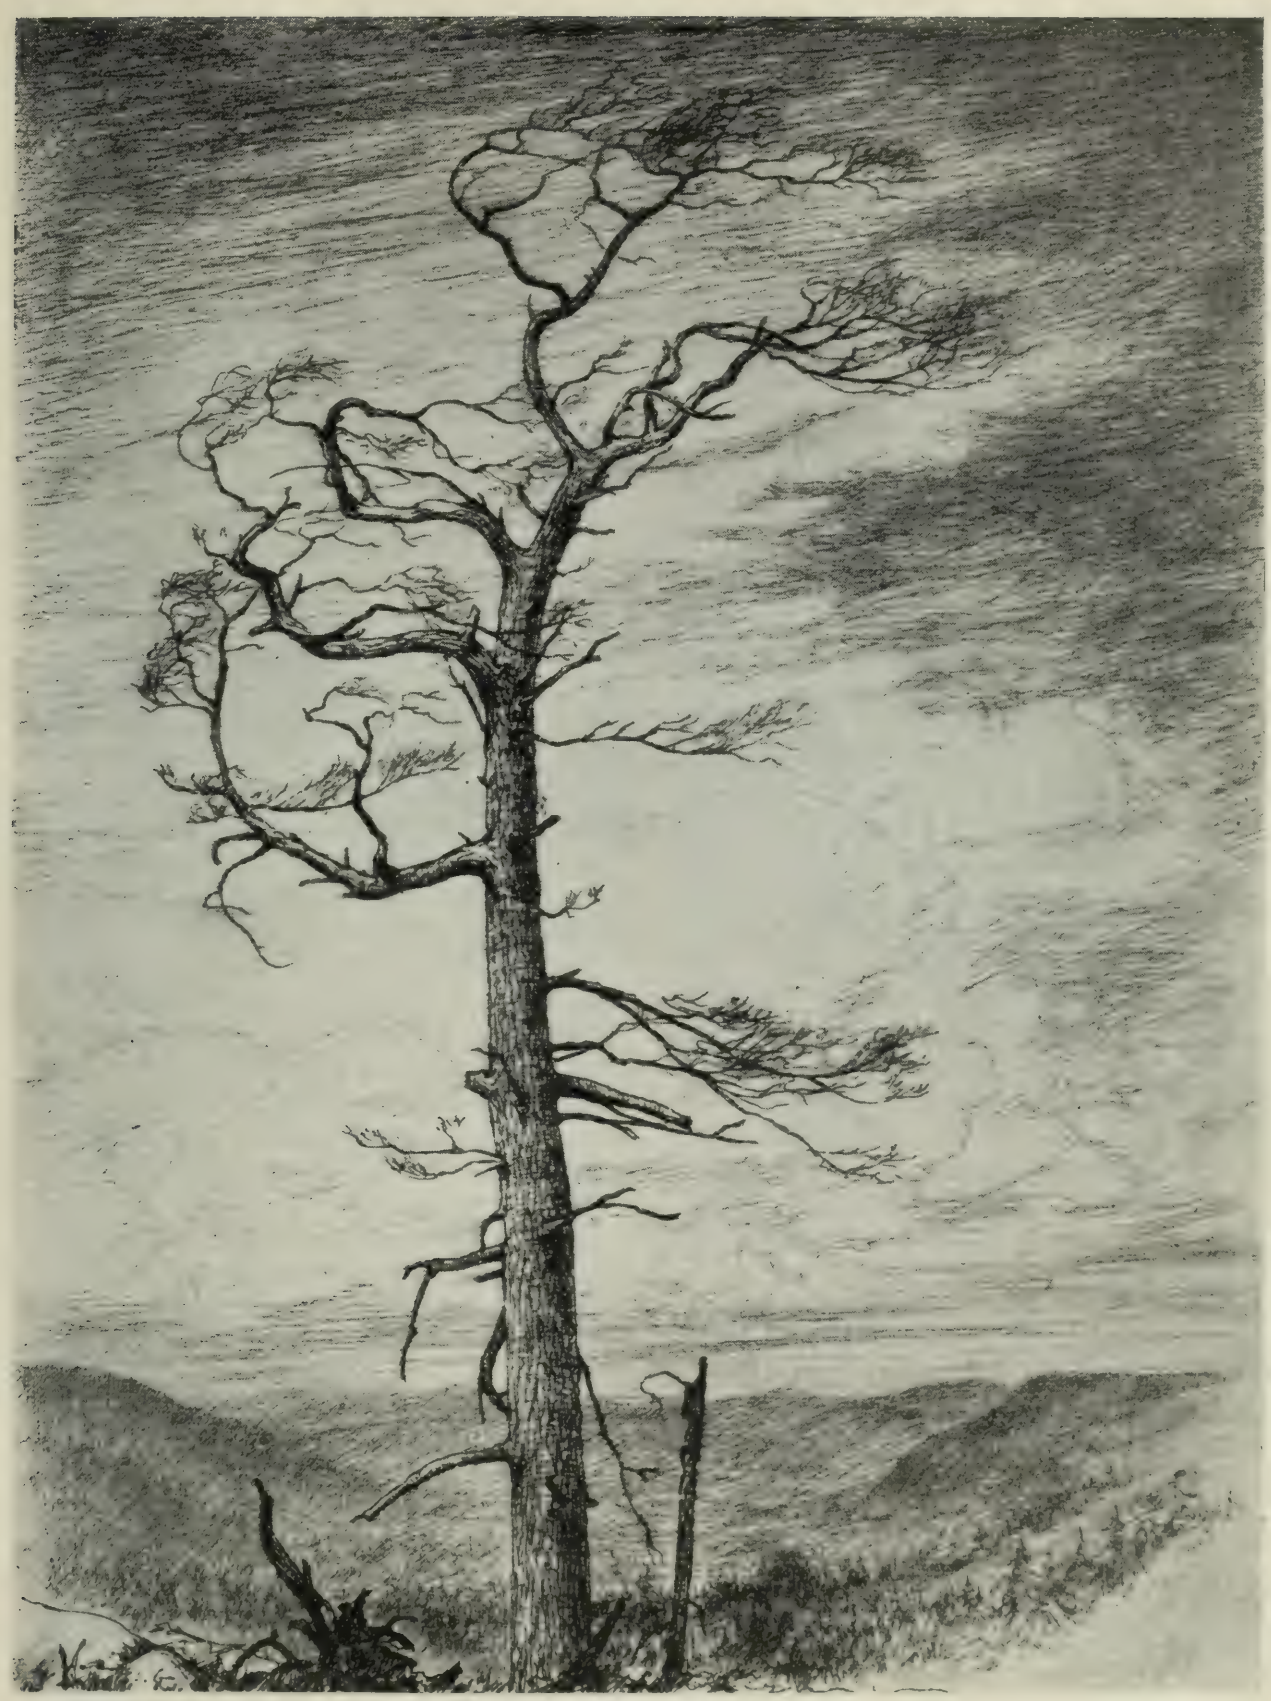
The quiet, narrow street where I played as a boy was shaded thruout the summer by a double row of maple trees. Always, as I lay on my back at the edge of the broad tree lawn in front of our house, digging my bare toes into the soft warm dust of the road and looking up into the thick foliage, there used to come to me visions of roast duck and apple pie.

Why such thoughts should have come to me at such times I do not know. They were only childish fancies. But to this day I never see those broad, comfortable trees, as generous and as far from aristocratic as our neighbors along the street, without feeling that they suggest a well filled larder, stocked with good old-fashioned home cooking.

"THE DESOLATION THAT DEATH BRINGS"

The trees that I knew well I came to regard with well defined feelings. There were two apple trees in our yard. One grew near the woodshed and I disliked it intensely. It reminded me of old Mr. Carley, whom every one knew to be the meanest man in town.

For want of trimming, the tree had grown all out of reason. It was long and thin and crooked. Half of its limbs were rotten, and never, within my memory, had it borne even a single green apple. But the other tree was my friend and comrade. It grew under my bedroom window. It was sturdy and strong and never failed to bear a generous crop of sweet apples. A fork or two of its thick limbs furnished a hiding place for me on spring afternoons, and I used to snuggle down amid the thick foliage, to munch the white blossoms and the crisp, tender leaves, as I read the *Arabian Nights*.



As I grew older and played farther from home, all the trees, in turn, came to have a song or story for me. The sturdy beeches became grave councillors, and when I reached my fourteenth year, and had fallen hopelessly in love with the Latin teacher, ten years my senior, the willows along the river shared my sorrows.

And finally, when I became older and wiser, and wading into the fourth book of Virgil, I looked one afternoon, thru the windows at the top of the little cottage to the distant hills that rose, one above the other, far across the country, until they blended with the sky in a purple haze. And I felt a great longing to leave behind the Trojan heroes and to

From a Drawing by Kerr Eby

"THE FARTHEST FRINGE . . . THE TREES UNTOUCHED BY MAN."

From an Etching by Kerr Eby

"THE LONG, BARE ARMS SHIVERED DESPAIRINGLY IN THE COLD NORTH WIND."

penetrate into that faraway country. The distance was calling me. I wanted to pierce even beyond the farthest fringe on the horizon—to reach the forests, away to the north, where Odin and Thor had lived—to know the trees untouched by man.

A year ago the longing returned, together with an idea for carrying out my wish. It came with an opportunity to

join a surveyor's gang that was to run a line for a railroad thru the forests of Canada, from Sault Ste. Marie to Hudson's Bay. It meant six months of hard life in the open, with never a face to see save those in the camp. But there were trees whose tongues I should hear and hills I should come to know. It meant long days of fatiguing labor, carrying a level thru an almost impenetrable country. But there were times, I knew, when work would be slack, when I could listen to the stories of the waving boughs and jot them down on my sketch pad.

My real journey into the forest began after I left the train that had carried me 79 miles north of the 800. From the last village I rode thru unbroken country on a crazy work train that pitched and lurched thru the cut until it reached the end of steel. From there I had to hike alone for 25 miles along the unfinished grade of broken rock.

But I forgot the heavy pack and level I was carrying for the wonder of the scene about me. On all sides rose the rugged hills, topped here and there by giant Jack pines. Nearer, along the Agawa River, grew great stretches of birch and hemlocks. So dense was the underbrush that it was impossible to travel alone away from the valley.

The camp was 50 feet from the bank of the river—an office, a bunk-house, a kitchen and dining-room and a lean-to, all joined together. There were nine men in the camp. It was early in May when I arrived, and snow was still on the ground. The birches were just opening their light yellow leaves. It was during those first days of spring, and later, in the early fall, that I found time to wander among the hills, sketching and dreaming.

At first it seemed to be a somber story. The thickly knotted pines and spruce trees, clinging to the jagged cliffs, were huddled together, reaching out their tufted branches in mute appeal. Here and there the rough brown rocks had broken away, carrying with them the sturdy trees to die and blacken in the sun. The wailing branches told of the struggle for existence in that hard, stony soil. And below, in the valley, we were working to build the railroad that some day would bring their lives to a close.

There were great stretches over which forest fires had swept. There the story was one of utter hopelessness. A few charred trunks still stood, monuments to the virgin forest that had been swept away. A second growth of saplings had sprung up, feebly hoping in turn to become lords of the forest. But I had yet to learn the utter desolation that death brings. It was told me late one somber afternoon when I had climbed the hill, half a mile from our camp, beyond which it was impossible to penetrate. There I made the acquaintance of a giant jack pine that stood stark and alone. Death had nearly reached the heart of the great tree. Half of its branches had been stripped and broken. Those that remained were gnarled and twisted and bare of foliage. And as the north wind sent the low, dark clouds scurrying across the sky, the long, bare arms shivered despairingly in the cold. It was later, when I came to know the birches that grew in the valley, that I learned the message of peace and cheeriness which the forest had to tell.

Above the rippling waters of the Agawa those sturdy birches grew, heedless of what lay beyond the hills, no mad ambition to reach higher than ever tree had reached before. They seemed to be living only to brighten the forest and the valley with the shimmer of their shining yellow leaves and the silver sheen of their smooth trunks. The saplings nestled together peacefully, watched over by the older trees which by their kindly and careful habits had grown to be sturdy and strong, with fat, well-nurtured trunks. In the branches song sparrows were twittering.

For a time I sketched. Then I sat down beneath the largest of the birches, feeling mightily contented. The breeze gossipped in the branches, and I lay back and looked up thru the quivering foliage. It was radiant with light and delicate motion. The sunlight had turned the pale tone of the fresh young leaves to myriad tints of green and gold.

From somewhere behind the gentle rustling I fancied I could catch the faint sound of a shepherd's pipe. I could see in the waving tree tops the face of Peter Pan. I could hear in the breeze the voice of Tinker Bell.

In Defense of Swine

By Battell Loomis

A Swineherd

[Mr. Loomis's distressing experiences in the care of horses were narrated in our issue of January 23. Evidently he finds pigs more congenial.—Editor.]

"Pigs! Ungh! Nasty, filthy, grunting things! I wouldn't have one within sight, sound or smell of my place, unless he were simmering in a pan, and then I'd be a fool, since pork disagrees with me. A pig is nothing but one long, squealing appetite issuing from an ugly snout, attached, by degrees, to a barrel of fat on four stool-legs."

That, gentle reader (I hope you are gentle), is the distressing picture most people see when they call their jam-closeted children bad little piggish brats. Truth is that, like many other photographs, it is an erroneous picture, all out of drawing, with ridiculous perspective and with none of the meditative haze that invests a painting, say, by Scott Dabo. That is in toto a painting by him, I should add, since I chanced upon that artist's name for illustration.

Now, I know swine as the novice may not and as I did not before I became an expert in their management. And I am free to say that however much I may have hated them during my novitiate, and it was much, I now like them and am even fond of special ones. Old Sowzel, for instance. "Old" because she is the youngest and "Sowzel" because it suits. Take Old Sowzel for an example of the brotherhood principle as it exists in swine. She is as playful as a human child, and as naughty. I cannot stand my broom in a corner an instant and turn my back without her dashing at the straws and beginning madly to tear them to shr—breakfast food. I gently prick her pretty, pink, round-as-a-dollar percolator nose with it and she squeals with bad delight and antics off across the boards shaking her head for all the world like a colt acting kittenish.

Sometimes I unbend from the austere attitude of master of all I survey and condescend to scratch her belly. Does she respond unemotionally to my attentions? Not at all. She keels over like an overripe cucumber at the peck of the hen, and her thin-lipped and rather severe looking mouth melts into an open smile of such deep satisfaction that the approving grunt is positively tautologic. Of course she has to grunt, but her tone in doing it expresses such luxurious content that it is a moral lesson in itself and a preachment in gratitude to us grasping mortals. So she lies there upon her side smiling ridiculously, like a shark, with her fascinating eyes half-closed, and I scratch her pink belly. She's white, you must know by that. An O. I. C. (Ohio Improved Chester), lop-eared; in fact, the very best hog in the market—unless you chance to keep Berkshires. (I by-way thus to prove that I know a lot about pigs.) Pretty soon, as I continue to rasp her with my nails, a wonder appears. Her fat, stumpy little nigh hind leg begins to go thru the motions of scratching, too. Is it mesmerism? But that is not the wonder. I mean, how can such a dumpling move such a dumpy leg when lying in such a jelly-like position? I give up, but I don't invite correspondence upon the subject.

Then there is Borel, a little fellow with the most captivating curly hair imaginable. He, when I go to feed him, illustrates the pig voice in another register. I confess it still irritates me, but I find a modicum of comfort in the amazement I feel that so small an animal should have so basso-profundo, fifo-soshrillo an organ. And such a bellows! It is not the puff-puff kind of old-fashioned usage, but the crank-operated, perpetual draftmaker of the modern forge. Yet, since his squealing merely indicates that I do not feed him frequently enough, why should I blame Borel?

Another one of the family has a non-committal name because he has become a non-committal being. He expects to live on the fat of the land and end in

lard, but that is simply explanatory and by-the-way. Pig-snipper's chief characteristics are curiosity and suspicion. When I first approach him he barks twice, like a dog, a warning of impending danger, sets his ears on end, ruffs his neck and prepares for flight. As I make no dangerous overtures, he advances toward me eyeing me suspiciously the while, and when he finds it's his old friend and Darwinian blood brother, he begins to inspect my apparel. My shoe tips, if such blunt ends are tips, being blacked with wheat middlings, he first gnaws until a motion toward and to his snout reminds him that they are not so useful for his food as for my locomotion. Having recovered from his fright, he comes nearer and unties my hide shoe lace. Of course, I am busy and not watching him constantly. The next thing I know he is engaged in trying to take off my overalls; then he gets a carelessly dropped glove and shakes and tosses it until I relieve him of it, upon which he rushes into my lantern, upsetting it, and has his snout in the pail of feed I am mixing before I have relighted the beacon.

Wallops, because she is always annoying and frequently licked, is fond of getting between my two legs and looking up at me complacently. When I scissor her with my calves, she shrieks and moans like a lost soul, and the other day upset me upon her back when I happened to be standing upon a slippery part of the floor. She has many voices; that of search for food, a whine; that of having found it, a chortle; that of warning, a bark; that of whenthedevilareyougoingtofeedme? a revolving ship siren; that of thanks for the warm sunlight or the stove, an infrequent "Ach, Gott"; that of welcome to the scratching five, an occasional "Oh, dear me, I'm so happy"; and most common, that of running with the drove, a step-counter like "glungh-glungh-glungh, rest, glungh-glungh, rest, glungh, rest, glungh - glungh - glungh-glungh," etc., with variations.

A pig is active, industrious, fleet, playful, appreciative of kindness shown, shrewd, fearless, indomitable save by superior strength, all these and other commendable things. That he is gluttonous is due to environment alone, and were he not, he would not be profitable to raise. He is like some men in this respect, and his human kindred are like him in being profitable to the parasites that hang upon their wants and note—if they do not, like me, annotate—their words.

I will only admit against the pig that his habits are not nice when he is left on his own resources; but what wise man, owning vegetation, will leave him upon his own resources? Certainly there is no more quaint spectacle in the animal kingdom than a pen of pigs swarmed upon one another like cornstalks in a shock, with their pointed ears (if they are Chester Whites) all erect and their cunning eyes all wide open as they sleep.

In conclusion and to clinch the argument, when we think of how poor the pain-making dentists are becoming just because of the white bristles the pig yields to our brush handles, we must refrain from speaking disdainfully of the animal and, if we are wise, we will accord him the admiration he deserves for his many sterling traits and seek to better our acquaintance with him.

Torringford, Conn.

The Forest Wealth of the Philippines

By Maurice P. Dunlap

Formerly Collaborator in the Bureau of Forestry, Manila.

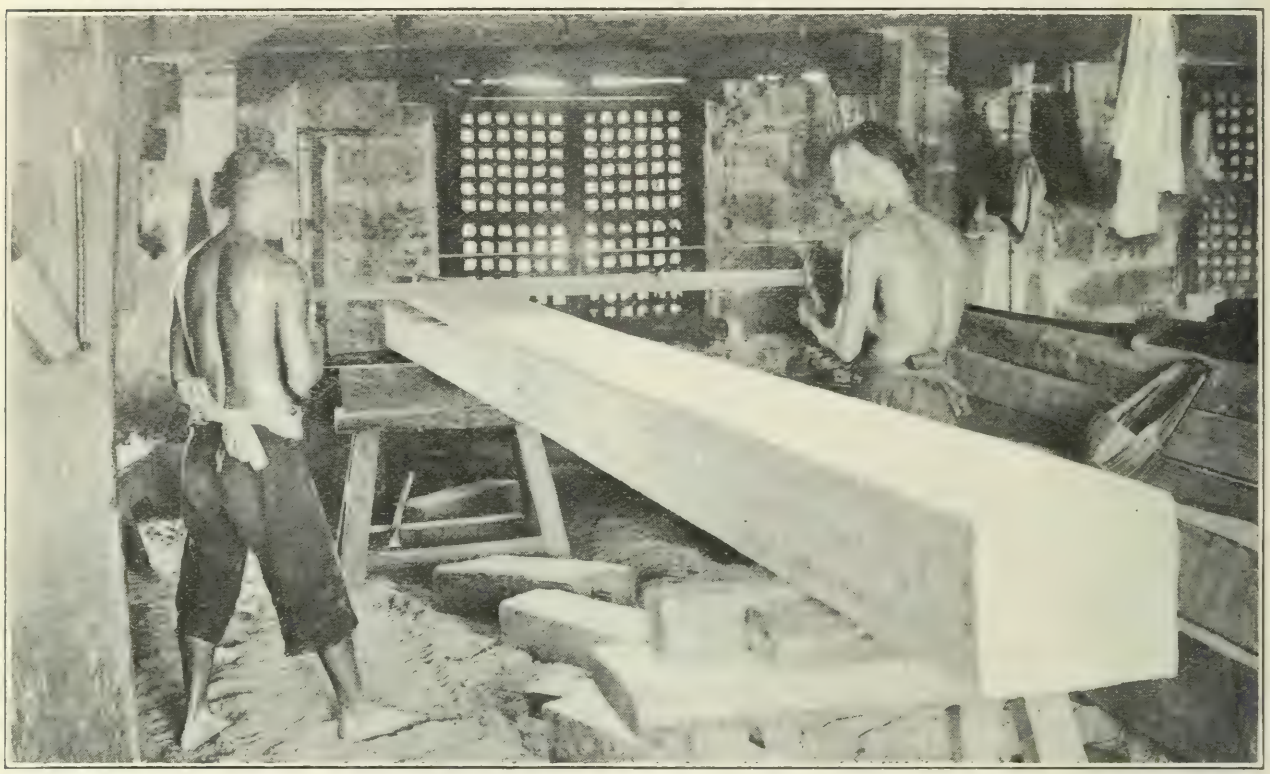
In the days of Spanish rule, certain writers suggested that perhaps the Philippines were the biblical land of Ophir. This belief was founded on the mention of Ophir in the Bible as the land of rare woods and spices. But the real extent of the valuable soil products of these fertile islands was little more than surmised by the Spaniards. Even today the American public do not realize the enormous untouched wealth of the Philippine forests, not only in rare woods, but in woods available for every ordinary purpose.

Thru the efforts of Major George A. Ahern, the able director of forestry at Manila, and his corps of foresters and assistants, a definite idea of the exact wealth contained in these stretches of virgin forest has been obtained. Steps have also been taken as far as limited funds permit to provide ways whereby the forests may become of practical value as a revenue-producing asset. The result of this labor has brought forth some interesting facts. There are approximately 40,000,000 acres of available public forest land in the Philippine Islands, which hold by rough estimate a stand of 200,000,000,000 board feet of merchantable timber. The figures of themselves cannot mean much to the average reader, but a comparison with similar figures taken from other lands and a consideration of corresponding revenues derived from their forests may be instructive, if rather a reflection on our development of the Philippine forests to date.

Russia, Canada, India, the United States, Japan and Sweden are the only countries in the world having larger available forest areas than the Philippines. France and Germany each have less than our islands; yet in these countries the net revenue from the forests is enormous. Forestry has been called the yardstick of civilization. As a nation conserves her forests and makes them a source of profit to her people, so the development and prosperity of that people may generally be gaged. Unfortunately, the Philippines do not measure high on this yardstick. The annual revenue from her forests amounts to an average of slightly over $105,000; her net revenue to about $50,000. Germany's net revenue from her well managed forests is nearly $8,000,000.

A comparison with Japan is somewhat more to the point. The state, in Japan, owns 33,000,000 acres of all the wooded lands. The net revenue accruing to the Government is about $1,000,000. Japanese students of forestry have until recently been educated in other countries, but now they receive their training at home. Japan exports nearly $1,250,000 worth of wood a year. The Philippines export only a little over $100,000 a year. And she imports more than she exports!

A DOOR OF SAN AUGUSTINE CHURCH



Wood-carving has long been a highly developed art among the Filipinos and the hard-woods of the islands furnish abundant material. The San Augustine Church dates back to 1590.

One more set of figures may be of in-

terest, for Japan is an old nation and self-governed by a people capable of taking care of themselves. A better comparison is offered in Java, a country in the tropics whose people are under a colonial government, as are those in our islands.

ited share of attention. In reality, the soft-wood trees are more abundant than the hard-wood and are more available for immediate use.

A variety of tree known as *lauan* produces a fairly soft, strong wood, growing

PREPARING TIMBER FOR THE MARKET IN A MANILA SHOP
This shows the native method and Chinese workmen. A limited importation of Chinese labor would do much for the development of Philippine forest resources.

The people of Java are every year richer by $800,000 because of their forest products. Java's available forest area is not half that of the Philippines.

Evidently there is a very great discrepancy between the potential wealth and the actual revenue-producing value of the Philippine forests.

Yet the Government of the islands gives American investors every possible encouragement and takes every pains to remove obstacles. Expert foresters stand ready to do all in their power for whoever wishes to enter the new field—their services being offered gratis. The Bureau of Forestry stands ready to give accurate information.

The hard-woods have received a good deal of notoriety. Most people in the United States have a vague idea that there are in the Philippines forests of fine cabinet-making trees, but the soft-wood trees have not received their merin great abundance and being equal to the Oregon pine or the California redwood. It has a handsomer figure than these American woods. Then there is *apitong*. *Apitong* is a variety that is harder, heavier and stronger, and makes good construction timber. Both the *lauan* and *apitong* trees grow to a large size.

The hard-woods, as I have said, have received due consideration—indeed, almost undue consideration in comparison to the soft-woods. However, the supply of the former is also most extensive and the quality is nowhere excelled.

There is *mancono*, for instance—a wood so heavy that it sinks in water. Like a wood called *lignum-vitae* that has been so extensively imported to the United States from the West Indies, *mancono* is available for ship building purposes and such sporting goods as ten pins. The wood of the *mancono* is practically indestructible. Even the white

ant—that curse of the tropics—does not attack it. The tree grows in northeastern Mindanao in considerable abundance and should be a most satisfactory substitute for the depleted supply of the lignum-vitae.

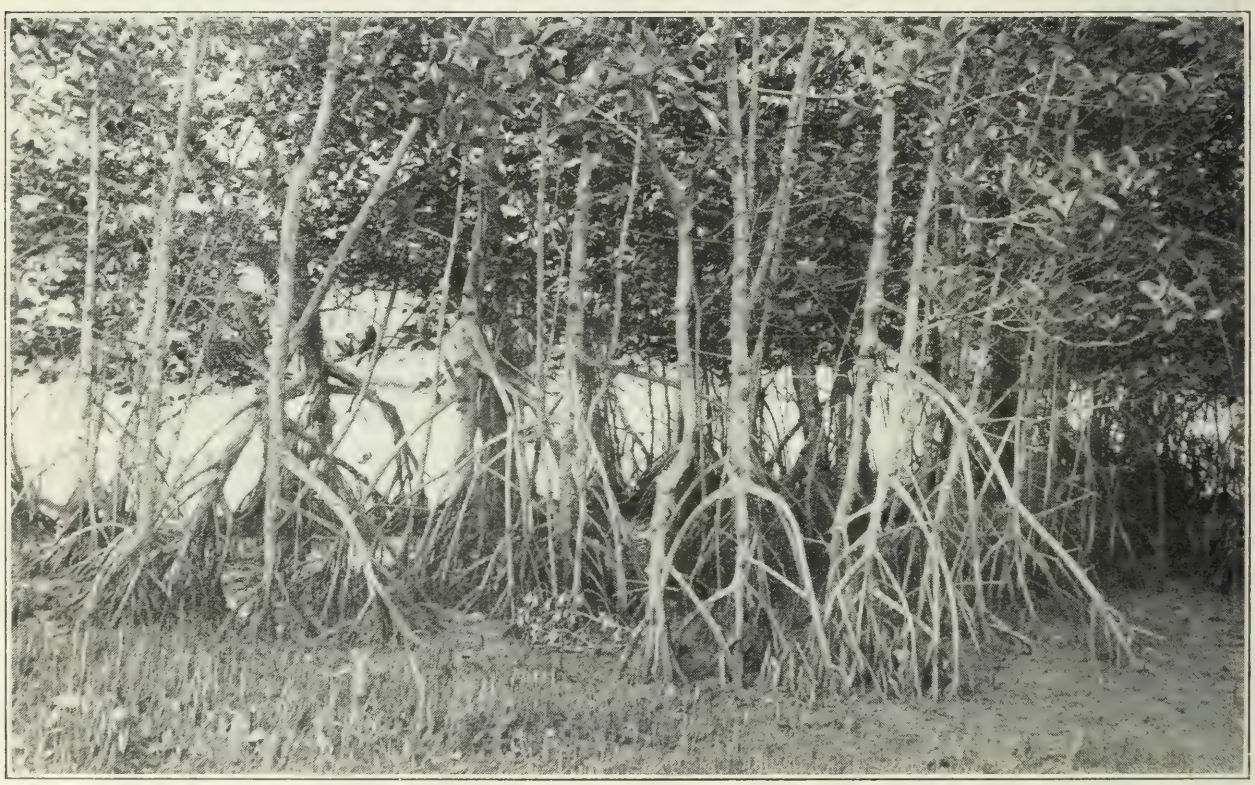
Then there is the "ebony group" of trees. There are several distinct species of these in the Philippines and they are generally distributed thru all the islands. The several species are known to commerce as *bolongeta, camagon* and "true ebony." However, one finds these trees high above the marshes where it grows, is the mangrove. All thru the Malay archipelago this tree bush thrives in abundance along the sea coasts. It is from this tree that "cutch" or tanning material is derived. The United States buys much of its tanning material abroad. Until very recently the big market of Borneo for this cutch was the United States! It seems humorous that the American in need of tropical or oriental products seems to look for them everywhere else but in the Philippines. He does not real-

BAMBOO BY-WAYS

There are many fine varieties of bamboo in the Philippines, some wonderfully strong and durable, and they are by no means less attractive for all their utilitarian value.

called by at least thirty different native names, as he proceeds from northern Luzon to southern Mindanao. In Manila one may buy a walking stick made of one of these beautiful woods for ten cents.

The so-called minor products of the Philippine forests are "minor" only in comparison with the enormous wealth tied up in the uncut timber. Some of the principal articles of commerce derived from these are tan bark, gutta-percha, rattans and the products of bamboo and various palms.



A curious looking tree, with its roots

ize that with a little development the same product could be extracted from United States territory without encountering the tariff difficulties of foreign lands. As with many other of the Philippine forest products, native methods are not sufficient in the case of the mangrove for the development of these great swamps of potential tan bark. Yet a steady market would seem assured for all that could be produced, as it is of great value for tanning leather, preserving sails and fish nets and coloring tea and Chinese cloth.

Gutta-percha is a Malay word meaning "gum of the percha tree." Trees yielding this substance have always been found on many of the Philippine islands, and Philippine gutta-percha has found a considerable market. Both the gold and the glory accruing, however, have gone elsewhere. The Chinese rather than the Filipinos have been the gainers and the market for the product has been Singapore and not Manila. Gutta-percha is not India rubber. It is less elastic and has fewer uses. Its value for the insulation of cables brought it commercial prominence and the demand for it has steadily increased. Philippine gutta-percha is bought by the Chinese merchant from the wild tribes of the southern Philippines and sent by him to Singapore by way of Borneo. Here it is known as "Borneo gutta-percha." No white man has solved the secret of its preparation into the merchantable product. How it is selected, boiled, adulterated and colored are mysteries known only to the Chinese. Nevertheless, the crude gum itself has a commercial value and its development would increase the forest revenues. Within the past two years companies have begun planting gutta-percha and rubber on a considerable scale in Mandanao. As for the present available supply, great numbers of the percha trees are ruthlessly felled every year by wild tribes and parts of them sold while the timber is left to rot.

The bamboo is such a versatile tree that it would be impossible to describe all its possibilities within the brief space of this article. However, there are peculiar uses to which it can be put on account of its combined lightness and strength. In China, heavy blocks of granite are lifted by bamboo mechanism where iron and steel would be used in western countries. Indeed, we occidentals have only begun to appreciate uses of this plant that the oriental has known for many years. There are many fine varieties of bamboo in the Philippines, some wonderfully strong and durable. Bamboo has recently been tried as a support for the engines in airships.

Paper is one of the products that can be made from the bamboo tree. Other

A MANGROVE SWAMP IN THE PHILIPPINES

Thruout the archipelago this tree-bush thrives in great abundance along the flat sea-coasts. It is from this tree that "cutch" or tanning material is derived. As with many other of the Philippine forest products, native methods are not sufficient for the development of these great swamps of potential tan-bark. Yet a steady market would seem assured for all that could be produced, as it is of great value for tanning leather, preserving sails and fish-nets and coloring tea and Chinese cloth.

BAMBOO MUSICIANS

One of the many uses of the versatile bamboo tree. All the instruments in the picture are made of bamboo.

possible paper-making products in our islands are hemp, cogon grass, banana and certain palm trees. However, "Manila paper" is a misnomer as far as it might mean that there is paper made in Manila, for there is not. Paper has been made in the Manila government laboratory, but there are no regular paper mills in the islands. This still remains one of the many unworked fields with great possibilities. Japan, with similar plants, has taught the whole world lessons in the art of making paper.

A palm tree that furnishes a good fibre for strong paper is the Buri palm. A still more important product of this buri is the straw hat that is made from its leaves. Manila hats to-day, with only native labor to develop the industry, have a recognized status in the commercial world. Mats and bags, machine-made, could be turned out in large quantities as products of this buri palm.

As for the coconut palm (it is never spelled "cocoanut" in the Far East), it is more proper to consider it as an agricultural rather than a forest product. Its value has long been appreciated in the archipelago and its product, copra, has been one of the chief exports. It might also be mentioned that there is still room for an increase in its cultivation in that peculiarly favorable soil and climate.

Lumber manufacturers should be interested in a recent statement of the Director of Forestry at Manila in regard to the Philippine forest wealth. He said:

"The shipment of Philippine lumber to the United States, altho small at present, could be made at once to assume large proportions, if the capacity of the local mills were increased to provide a sufficient surplus over local demands. *China presents an almost inexhaustible field* for the cheaper grades of lumber not suitable for export to the United States or Europe."

In this connection it might be noted that China's lack of foresight in conserving her resources has led to a general deforestration of her mountains. So on the one side we have the unlimited demand of China and on the other the

practically unlimited forest supply of the Philippines. Sooner or later one will be drawn on to satisfy the other.

The forest wealth of the Philippines seems to need stimulus for its development from three sources:

(1) The Philippine legislature should be convinced of the practical value of this development to their country and their own prosperity, that they might provide larger funds to further the forestry work. In Java the government spends over $800,000 a year, and in Japan, $500,000, in the interest of their forests. The yearly appropriation in the Philippines has been about $55,000 for the same purpose. The results, as noted above, are more than commensurate with the expenditures.

(2) The definite declaration by the United States of a *guaranteed perpetual, stable government* in the islands would do much to encourage investors—already favorably inclined—to devote capital to develop this enormous source of riches.

(3) Restrictions on Chinese immigration to the islands might be lightened to increase the available supply of efficient labor. This would be to the mutual benefit of the islands and the Filipinos. There is room for thousands of additional workers, who by making *real* the *potential* value of this stored-up wealth, would more than provide the additional means needed for their support. Besides, Chinese blood amalgamates readily with Filipino and the offspring is regarded as Filipino, so that no yellow peril need be feared in the Philippines.

New York City.

The Camping Trip

How to Hike Most Enjoyably at Little Expense

By F. R. Gorton

A summer outing—with vigorous exercise and plenty of rest and sleep—is almost a necessity for every able-bodied man engaged in a sedentary occupation. Without doubt, a camping trip can be made to bring about this combination better than almost any other; with proper regard to the details of the trip, the hard work entailed is made both pleasurable and beneficial. One returns from such an outing not only with a clearer brain, but, best of all, with an invigorated physique.

In carrying out a program like the one here described, the enjoyment begins with the first preparations, in which the participants should make free use of their own skill and ingenuity. Such a trip was planned and taken by the writer and a friend during the month of August last year. The place selected was a rugged, uninhabited stretch of country along the southern shore of Lake Superior. The locality offered many inducements on account of the scenery, trout streams, old logging trails, pictured rocks, pine plains, etc. It was decided that camp would be moved from four to eight miles each day, and that all supplies would be carried on the back. It will be readily understood that such an outing cannot appeal strongly to any except those who love action and are willing to work hard for at least four hours out of the twenty-four. In order to keep within the limits of about forty pounds per man, which is enough for one to carry, it is necessary to plan rather carefully.

In preparing for the trip, the first thing to be secured was a tent which would combine lightness with security against rain and mosquitoes. It must also be easily erected with materials which could be secured anywhere.

The tent can be erected in several ways. The most convenient method is shown in the photographs. Five crotched sticks are cut about five feet in length; also a ridge pole about ten feet long. The ridge pole is supported upon four of the sticks, two at each end; while the fifth serves as a brace at the closed end of the tent. The tent is then thrown across the ridge pole and the edges made fast to the ground with small stakes. The closed end of the tent is made to be

drawn well outward, thus largely increasing the enclosed space. When erected in this manner, one side of the tent can be elevated as a shelter by day, as shown in one of the pictures.

It is advisable to procure about twenty-five feet of strong, light rope, and two yards of mosquito netting. The netting is a necessity to prevent the insects from entering the open end of the tent. Each man should carry a rubber poncho, an extra pair of heavy woolen socks and underwear, a sweater and a double camp blanket. Heavy shoes with high tops should be worn, into the tops of which the trousers can be securely laced. Strong leggins are also useful, especially in walking thru underbrush.

In preparing the tent for the night, a slight excavation is made at the exact location of the hip when reclining. Soft fir or balsam twigs are then thatched evenly over the ground, and upon these are spread the ponchos with the rubber sides down. One thickness of a blanket is spread upon the ponchos, thus leaving three thicknesses available for covering. Coats and sweaters serve for pillows. When carefully made, such a bed in the woods or within sound of the waves is even more restful than one of patent springs and downy mattresses.

Since articles of food cannot be carried well in paper sacks, a supply of cloth sacks and tin boxes should be procured. It is a good plan to pack the butter carefully in a tall tin which can be set upright in cold streams at night. The entire collection of articles of food should be placed together in a strong grain sack and wrapped in a camp blanket. These with a poncho and extra articles for personal use will weigh nearly forty pounds, thus making a pack for one man.

The provision list includes enough for two persons for seven or eight days.

BLUEBERRIES FOR DESSERT

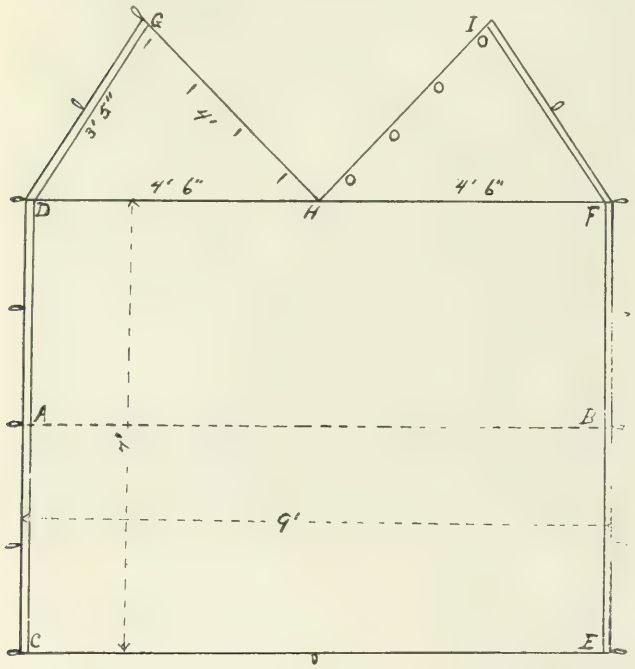
In the upper picture one tent flap is raised. The same tent with flaps down is shown below.

5	pounds	bacon.
5	"	flour.
3	"	pancake flour
2	"	rice.
1	"	onions.
½	"	coffee.
2	pkg.	dried soup.
2	cans	pork and beans.
¼	pound	baking powder
1	"	sugar.
1	"	seedless raisins
2	"	butter.
1	"	cheese.
¼	"	salt.
¼	"	tea.
1	cake	soap.
		Pepper.
		Matches.

A convenient cooking outfit can be secured from a dealer in camping goods. The following is a good combination: A skillet, 2 pails, 2 plates, 2 knives, 2 forks, 4 spoons, 4 cups, coffee pot and pail covers. The articles can be nested together and carried in a strong canvas bag. To this outfit should be added a light axe and a strong, sharp knife.

Daily menus will run about as follows:

Breakfast—Pancakes and bacon, rice, berries, coffee.



Dinner—Bannock and trout (or bacon), raisins, berries, tea.

Supper—Bannock and trout, cheese, tea.

Dinners may be varied by the use of

beans, soup, coffee, etc. If more beans are desired, it would be advisable to carry two or three pounds of dried ones, as the tinned article is too heavy to be carried as luggage.

The list of accessories to the outfit may be extended as much as desired. A good map showing the details of the region to be covered is almost a necessity, and the same may be said of compasses and pedometers. There is little need of a revolver or weapon of any kind, altho the presence of some means of defense gives a feeling of security which may be worth while. A light outfit for trout fishing should also be included.

A SIMPLE TENT FOR HIKERS

A fine grade of muslin is secured, 42 in. in width. Two strips 9½ feet long are sewed together strongly along the line AB. A hem 1 in. wide is made along each of the sides CD and EF. The two triangular end pieces are made of the dimensions shown in the figure and sewed firmly to the side DF. Four buttonholes are made in the hem GH and four buttons are sewed along the line HI. When the tent is erected, the triangular pieces form a closed end. Finally, strong loops about 2½ in. long are placed at the corners and edges as shown. The fabric is made absolutely waterproof by means of boiled linseed oil, which is rubbed into the cloth and allowed to dry three or four weeks before the tent is used. The weight of the tent will be about 8 pounds.

Much subsequent pleasure can be derived from the trip by securing photographs along the way. An expensive camera is not necessary for this purpose, as excellent folding cameras using film packs and costing five or six dollars can readily be secured. Some form of tripod is essential for use in the woods, since the light is not sufficient for snapshots. It is well to provide against accidents by carrying a few simple remedies packed together in a small tin box. Among these should be included a roll of aseptic bandage, adhesive tape for covering blisters and cuts, permanganate of potash solution, and a small quantity of absorbent cotton. Another small box should be found for camera films, buttons, needle and thread, and other small articles for personal use.

In order to carry the packs comfortably, each man should be provided with shoulder straps, which are sold by dealers for this purpose. The articles to be carried are first separated in two equal portions with all articles of food in one group. These portions are now arranged into bundles about two feet long and as nearly flat as possible, and each is placed upon an open blanket, which is wrapped snugly around it. The bundles are then strapped tightly and adjusted to the correct position upon the backs.

In undertaking a walking trip thru a region which is wholly unknown, secure as much information as possible before the start. Often a bad trail will spoil a day's outing. Another point to be considered is the supply of drinking water along the route. On the trip mentioned above, good water was rather abundant in the cool, swift streams, as well as in Lake Superior, which was never far away. But under less favorable conditions a small supply would have been carried in canteens.

The hardships of a camping trip are few; the pleasures many. The traveler soon learns that nowhere is nature so lavish with good things as in the wild woods, where one might live for weeks on the natural food supply alone. Here man finds wood for his fire, meat for his table, fruit for desserts, and rocks and trees for shelter. By making use of these together with the luxuries provided from his pack, one can live like a king. A week of such living is altogether too short. The heavy pack grows lighter as the muscles become accustomed to the load, and the journey's end is reached only too soon.

VACATION EXPERIENCES

[The response to our request for accounts of our reader's vacations, or some one adventure or impression of the vacation, has been most hearty. The first prize is awarded to Miss Elsie Simpson, of New York, who contributes "The Sight of Salt Water Unbounded." The second prize goes to Miss Jane Bliss, of Minneapolis, for her "Teaching Vacation." We thank these writers and all the rest—both those whose little articles are published and those for whom we tried in vain to find room—for their most interesting narratives of pleasant days, and for the suggestions which will, we hope, give other readers of this magazine a happy outing or a cheerful vacation outlook.—EDITOR.]

The Sight of Salt Water Unbounded.

"Who hath desired the Sea?" the mighty, trackless sea, where there is nothing but water for miles and miles on every side; where you can smell the salt of the sea and feel the spray on your cheeks; where you can see the wonderful blue color of the sea; where you can see the sun sink slowly in the west, a great, round ball of crimson fire, now plainly visible, now veiled in a soft gray cloud, purple thru the mist, gleaming crimson thru the rifts; where you can see the sky turn a beautiful dark blue, with a hint of the color of the water, and the mists flee away before approaching night; where you can watch the stars come out, clear, bright and sparkling, and where you can look up and see *all* the stars; where you can see the moon rise slowly in the east, large and warm and red almost as the sun, mount slowly, growing brighter and cooler and smaller all the while, chasing the stars before her as she rises; where you can see gray clouds scurry across the face of the moon, and revel in effects more beautiful than any Japanese ever painted; where, if you are mad and wild enough (and incidentally can persuade the watch that you are not quite insane) you can stay up all night and watch the moon grow paler and paler and the sky grow gray and colorless, and know really that the darkest hour comes just before the dawn; where you can see off on the horizon the first faint flush of dawn, and can see the sky grow slowly pink and gold and see the rays of the sun thrown up against the heavens, and, watching, see the first red rim of the sun appear on the edge of the sea, large and round and flame-colored; or where on moonless nights you can see the iridescent phosphorus gleam and glimmer in the black waters as the ship travels on; where you can see the long, phosphorescent wake of the ship trail off into infinity; where you can hear the soft ceaseless swish of the waters against the ship as it travels on and on, never ceasing; where you can see, after many days, a small, flickering light appear way, way off and thrill with the cry of "Land!" where you can be ushered into port by flocks of soft gray and brown, white-breasted gulls, who circle and recircle the ship, never resting, pretty, graceful, tireless creatures; where the old disappointments, old defeats and old cares fall away; where tired nerves and weary brain are rested; where you lose your own petty self in something which is bigger and broader and vaster and all powerful, which makes a great deal of life seem worth while, which gives new courage, new hope and new visions, and where the "girl you might have been" and the "girl you are" become the "girl you will be."

"Who hath desired the Sea? . . . The Sea that his being fulfils?"

ELSIE SIMPSON.

New York City.

A Teaching Vacation.

Like Aldrich's Bad Boy, "I would have committed suicide if I could have done it without killing myself."

Or if I had not been so tired in mind and heart and body that the bare thought of enduring the sympathy of my family be-

THE SPOOK'S PASSENGERS SEE STONINGTON

came unendurable. It would take the style of the patent-medicine advertisement adequately to relate how a little kindness made a baby of me and how even the gentle ministrations of my mother, usually so soothing, seemed a mockery of healing.

Just when the city had become intolerable to a mind turned in upon itself there came a call for a substitute in District 30. I pocketed my pride. In my part of the country, college graduates do not teach country school, but there was no place where I so longed to be. Two months of sleep and work and wind and rain. I desired them above all things in the world.

It was a regular Ichabod Crane schoolhouse, with its blue woodwork, dejected curtains, makeshift blackboards and tipsy desks made to fit no small backs that ever sat in school. There were bottles in the windows, and maps that pulled down and would not pull up, and a globe, and a useless old clock which always gave you the impression of having just stopped, altho its dusty pendulum had not swung for nine years.

But mostly there were children—long-legged boys with dirt in their ears and holes in their overalls; short-legged boys with trousers unbuckled and hanging dismally over their knees; big lumpish girls and midgets with snapping eyes and clod-hopper shoes; *liebchen* of seven and eight listening round-eyed to *Three Bears* and *Little Red Riding Hood,* stories with which little English children are familiar at five; Irish laddies of ten and eleven returning to school solely because of a rumor that you are teaching singing—you who pick out tunes with one hand only and expect to sing only when you get to Heaven; *enfants terrible* cheerfully "reading" their third primer by the picture at the top of the page, knowing every single story by heart and not one separate word!

Who, engrossed in the really scientific problems of rural pedagogy, would not have forgotten yesterday's troubles? Who would not have grown fat and jovial of spirit, her heart fed by plentiful appreciation, her stomach filled with potatoes and cream and eggs, and her mind rested by ten hours' sleep in the quiet of country nights?

Lonely in the country o' evenings? You have not known the excitement of calves and incubators and ghost stories, the relish for country politics, the spirit of adventure for persons and places. Your Irish landlord was an adventure, so was the French baby next door! to say nothing of "Injun Ben," fiddler of delectable kitchen dances, and the nag he lent you on Saturdays. Going to mass was a Sunday adventure, and your Protestant excursions into moral states hitherto undreamed of, even with allowance for foreign population, were week-day adventures as thrilling as a journey to France.

Oh, if all country school-teaching could only be as mine was, a deliberate vacation from worry and fear and regret!

Minneapolis, Minn. JANE BLISS.

The Cruise of the Spook.

A consuming desire for freedom, with the excuse of educating the children, led to the making of shelves and a table for the thirty-foot launch, Avis, and plans for the sleeping of Father, Mother and four children. No room being left for the oldest daughter with a husband, we promptly made an oilcloth awning for the sixteen-foot sail-boat Spook, made a mattress to fit the bottom, stowed the ice-box and percolater aboard, squeezed the supplies in fore and aft, grabbed the camera and sailed away from Greenport, Long Island.

We beat the launch to Plum Island, and on the strength of bacon and eggs explored Fort Terry. The next day the launch towed us across the Sound to quaint old Stonington, Conn. The following afternoon we towed to Watch Hill, R. I., and kept dry thru a bad storm. Next morning dawned clear, and we sailed to Westerly and back, on the Pawcatuck River, and after the second night at Watch Hill we towed to the Mystic River, sailing up to the town of Mystic, Conn., then down to Noank, where we boiled a lobster in the wash dish for supper. In the morning, after anchoring off New London for breakfast, we raced on ahead of the launch for Norwich, the folk laughing as they passed us becalmed between the hills. We spent Saturday evening in Norwich, finding food for Sunday dinner, and a quiet Sunday rambling among the hills, then away down the Thames to Groton and its Revolutionary associations. Night—then a morning tow with sail set, across the Sound to the Fort Wright Harbor at Fisher's Island. We spent most of that night listening to the moos of the foghorn, and at four in the morning, with waves running high, we towed to Orient Point, then under sail put for home and the little old tent on the beach.

A cruise of a week in a sail-boat was really living! After an exciting day of tacking up a river or reefing and racing before the wind, we ate everything in sight, made our beds each side the center-board, and slept real sleep. Each morning brought the joy of good coffee and a trip ashore to explore for grub, then all made snug aboard and off again, ready for the experiences always waiting for us. Salt air, fresh air, Watch Hill early morning fog and Norwich calmness, green hills and singing birds, and always happiness aboard. Then home again with something to think about all winter, and few to believe we are telling the truth.

New York City. EDITH ACKLEY.

SUNDAY DINNER ON BOARD THE SAILBOAT

IN THE NAVAJO RESERVATION
From a sketch in water-colors by Bertha A. Little.

Among the Navajos.

One of my most delightful summer vacations was spent with missionaries to the Navajo Indians of Northern Arizona, and the principal event of that never-to-be-forgotten time was a camp of ten days on the sloping sides of Blue Mountain. From the mission station the party drove for a distance of twenty-five miles, over sage-brush flats, finally arriving at an ideal camp ground in the heart of a pine forest. There we met a clan of Indians from Chinlee Valley, and the old medicine man, who was also the head of the clan, together with his wife and family, extended to us the barbaric hospitality characteristic of the tribe.

One day during a rain storm the party sought shelter in the home of the medicine man, and he proved to be an excellent entertainer, for he showed us the tools of his craft—ceremonial wands of eagle feathers and decorated sticks, also some sacred baskets and a small buckskin sack containing pollen. There was a sly twinkle in his eye as he untied the leather wrapper containing the wands, and he admitted later that his incantations could not heal the sick. His wife sat quietly on a sheep pelt on the floor, carding wool for a splendid Navajo blanket, but with small concern as to domestic duties. During the noon hour, without rising from the floor, she baked some cakes on hot stones, made coffee over live coals, then called the family about her for the noonday meal. After lunch, she pushed the unwashed dishes behind a barrel and continued her carding.

On July 22nd, the medicine man, his daughter and the interpreter accompanied us on a trip to Fluted Mountain, so named because of the peculiar formations to be seen on every side. The trail was steep, but

A NAVAJO ALTAR IN THE WOODS
From a sketch in water-colors by Bertha A. Little.

the magnificent view from the summit fully repaid us for the effort of climbing. For miles in every direction was a splendid pine forest, broken only at intervals by small valleys where two or three hogans and a few patches of corn and oats gave evidence of water for irrigation.

After enjoying the beauties of the landscape for an hour, the medicine man offered to show us a Navajo altar. So we followed him for some distance around the edge of the cliff to a large flat rock under a tree. The rock slanted slightly upward, so facing the East, and at the head was arranged a number of small stones. According to the medicine man, no human sacrifices had ever been offered upon the altar. Their gods are not as a rule benevolent, but they are easily propitiated by simple offerings such as beads, sacrificial sticks and cigarettes.

The medicine man was asked to tell the most interesting legend about the altar, and his story of "The sheep of flowers," offered by a goddess to appease the wrath of the Sun god, was as beautiful as many of the legends of Greece and Rome.

Albuquerque, N. M. BERTHA A. LITTLE.

Camping on Mt. Rainier.

About sixty members of our Mountaineers' Club of the Northwest left Seattle one July morning last year for a three weeks' walk around the north side of Mt. Rainier.

After a ride of five or six hours the railroad was abandoned and our long walk began. Tho the way was sometimes dusty, and the sun was more than warm, this first day in the open brought a sense of freedom unknown to the streets of the city left behind us. At the midday lunch beside a running stream we bade a long farewell to cold chicken and like dainties—henceforth the camp fare of the mountains. The after-lunch smoke is one of the most sociable events of the day. The legal lights at our left are discussing the relative merits of khaki and corduroy, and these fair ladies on our right are deep in the all-absorbing topic of boot grease.

Resuming the trail we plunged farther and farther into the wilderness. That first night we camped by a tiny spring and pondered long upon the softness of our sleeping bags, but finally fell asleep with the tinkling of the packhorse bells in our ears. The breakfast call was early and our dunnage bags must be ready for the packers before breakfast. Tho our possessions seemed to have increased in bulk most amazingly over night, we conquered, at last, and everything was safely tied up again. Delicious odors of fried bacon came floating in to us and soon we were eating of the chef's choicest viands.

For six days we wandered on, each day a story in itself ending at night in a camping place with a new charm. We finally reached a deep cañon where we were obliged to turn

CLIMBING TO CAMP CURTIS

This photograph was taken 9800 feet up Mt. Rainier, by H. V. Abel, of Seattle, Washington.

away and seek the trail of our comrades—the old General McClellan trail—to our camping place at the Indian tepees.

On the eighth day we reached permanent camp in Summerland, an indescribable, densely-flowered park, at an elevation of 6800 feet. Here a flock of mountain goats came down over the sky-line to feed, and again a few deer came browsing along another hillside. We were close against the snow-line and spent our days climbing over the glaciers and snow-slopes, returning at night to a blazing camp-fire, where we listened to all kinds of programs from geological discussions to limericks.

Some of our party climbed to the top of Rainier, but even we who did not get above 10,000 feet looked down into marvelous

blue-green crevasses, clambered around wonderful séracs and glissaded down the snow fields to our heart's content.

John Muir and Enos Mills have done much in describing our Western mountains, but really to understand their charm you must lie in the sweetness of their flowered meadows, you yourself must climb their rugged sides past the gnarled weather-beaten old trees up the snow-slopes.

Seattle, Wash. NANCY EMERSON.

A Chant of Adventure.

To leave desk and office,
To put away the briefs and pleadings and unanswered letters,
To forget the sheep-bound volumes of decisions and reports,
To go a-fishing;

To go to some lake in the still woods,
To be free, untrammeled;
To have jolly companions;
To make camp—pitch tent, collect wood, cook and eat supper of bacon and coffee and baked beans;

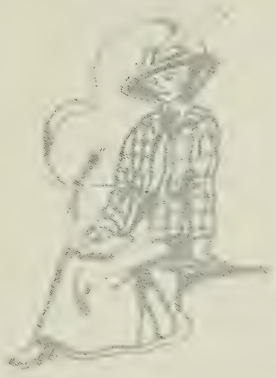
To talk, to gossip—to tell lies and stories—to stretch on the dry leaves and smoke and be merry;
To roll up in blankets and sleep under the clear stars—to be lulled asleep by the cool chanty of the frogs;
To be close to the vital earth;
To dream rural dreams—to awaken cold and replenish the dwindling fire, to sleep again;

To wake in the chill, rose-red dawn;
To rise and troll on the lake; to cast bait among the floating grasses and lily-bonnets;
To see the cold fog rising in white wisps from the lake; to see the sun rise;
To return to camp, fry the fish and have breakfast;
To fish again; to swim naked in the cold water;
To tramp in the woods; to feel adventurous; to climb hills and jump streams; to discover new lakes and deserted houses;
To hear the birds sing—the redbird and the blue jay; to hear the woodpeckers drum on the dead trees; to hear the wind in the pines;
To lead a wild life; to imagine oneself a savage for a night and day;
To be a faun, a satyr, to feel a part of nature;

To break camp, strike tent, pack kit and return home;
To go back to work with a brain full of pleasant memories . . .
To have the pines singing forever in one's ears . . . in one's dreams . . .

Orlando, Fla. VICTOR STARBUCK.

Vasil's Hunt for a Bride.



Yes, madame, my brother has taken his vacation. It was many years that we talked of it—of course, yes, to marry. The firm—we are all brothers—can now afford to marry. The oldest should begin. You can see, madame, that it shall be very good thing

IN CAMP ON MT. RAINIER
From a photograph by A. H. Cruse of Seattle, Washington.

for the firm to have a wife. And later we shall have another, when the business is still better. To be sure, it will be long time till my turn, the youngest.

You know how we Greeks arrange these things, the families, the relatives, the friends. Many letters came to us from down there in Athenés, with pictures of nice ycung ladies, for my brother Vasil is very handsome man. You are right, madame, we brothers are known to look alike. And when the pictures come, we and our friends look at them earnestly while we take our coffee and read the letters and take counsel together. But my brother is very particular, is he not oldest and head of the firm? One young lady is very pretty, but—her dowry! Another is of wealth, but at twenty-three unmarried—it is a mystery about her! And next beautiful one is educated, but of her family it is said they are Slavs and came only to Greece in the eighth century. My brother will have an old family.

Vasil said it was serious matter; also that he himself should decide it. You see, he has lived long in this country. But now we heard of one very fine—the age, the beauty, the family, the dowry, everything right. But still my brother because he is American citizen says, "I will see her first myself. Not before one week of acquaintance will I become engaged!" This is hard to explain to the people down there, but they know any girl is happy to marry my brother.

So the firm, we give Vasil a vacation that he shall go to Greece and bring home his bride. It is custom for the bride to come herself, but my brother is a New Yorker and very swell.

It is many years that he has not seen Greece and he finds it very slow, not like New York.

. . . . . .

No, madame, it came not to pass, and you shall see the reason why.

My brother called upon this family and they showed him much honor, so that on the second day he engages himself to the girl. But after two days he says, "Do you not play the piano?" and she says, "No." And the next day he says, "Do you not sew or embroider?" and she says, "No." "Then how shall you pass your time?" "Oh, just round" (she speaks very good English and my brother has forgotten a few of his Greek). But the climax, madame, you shall hear. On the seventh day came to congratulate them a relative with her baby. Vasil took the child and said, "May our babies be as beautiful as this," and the girl said, "*I hate babies!*"

. . . . . .

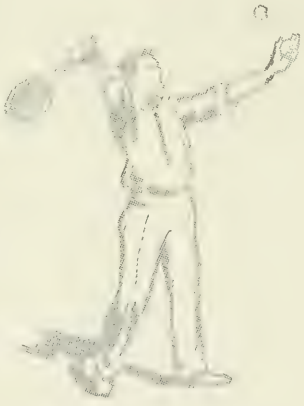
You see, madame, my brother has come back from his vacation. Probably the firm marries an American girl.

MABEL HAY BARROWS MUSSEY.

Croton-on-Hudson, N. Y.

A Countryman's Vacation in Town.

Why should not the countryman spend his vacation in the city? "Preposterous," said the wise friends who had traveled much in the old-fashioned way—which means hurry and bustle from place to place, from hotel to hotel, running at breakneck speed thru museums and art galleries and libraries, finally returning home more tired than when the vacation began. To these summer travelers a city vacation meant hot, dusty streets, the suffocating heat of down-town hotels and all the other discomforts of the city in summer.



But this is not the kind of vacation I had in mind. No countryman would desire to crowd into two or three weeks a half dozen cities and a thousand and one sights with the resultant jumble of unrelated notions and vague memories. My plan was founded on the assumption that there must be a number of city men who wanted to spend their vacation in the country just as there must be a number of country men who desired to go to the city for theirs. A fair exchange of houses could thus be made. The theory proved workable. Desirable city folk were found who were delighted to have just such a quiet village house as that afforded by Mr. Countryman.

Having selected New York as the goal, the first step was to find a city apartment that could be had at a reasonable sum for the vacation period. Thru the use of well-known and reliable agencies, it was found easy to get just what we wanted—a furnished apartment out on the Heights near Columbia University. And so we fared forth to the city.

The party consisted of Mr. Countryman, Mrs. Countryman and Aunt Azalea. The first stop was made for a week's visit in Washington. Now, in Washington, if one is seeking real comfort and if the size of the family purse must be considered, it is not expedient nor necessary to go to an expensive hotel. Private houses may be found in plenty where guests are welcome and where the stranger is not "taken in" to be robbed. The breakfasts we enjoyed at a modest price in the house of an angel

disguised as an Irish woman still make our mouths water when we think of Washington.

The rooms, within sight of the Capitol and the Library, were all that could have been desired and the weather was on its best behavior, so that the week in Washington was a real rest. For us there was no hurry, no hustle. If we came home from some trip too tired to go out to a restaurant or hotel for dinner, our good angel was always ready with coffee or some cool, refreshing drink together with fruit or sandwiches or whatever we desired. Our lunches, put up at home, were eaten under the cool shade of the trees near Mount Vernon or in some park. It may not have been citified to do this, but it was solid comfort. "Was it expensive?"—my country friend asks me. Well, we actually saw Washington, leisurely, comfortably, at an expenditure per person of the stupendous sum of one dollar a day. Think of it, you who would do likewise, three dollars a day had paid for rooms, food and carfare for three persons, in a city where sightseeing is generally regarded as exceedingly expensive! There was no stinting of ourselves of any creature comfort either. We had really succeeded in combining all the pleasures of staying at home with all the pleasures of travel.

But how about New York? Our coming to the great city was a real home-coming. Our baggage had preceded us by several days and was all ready for us on our arrival; so within a few moments after reaching the city we were at home and ready for our month of unalloyed comfort and pleasure.

Our apartment was in an ideal situation. There was an exposure on two sides, one overlooking beautiful Morningside Park, so that there was always a sufficiency of light and pure air. Those who know only the dirt and dust of the city will find it almost impossible to understand the beautiful situation of those who have the good fortune to dwell on the Heights overlooking Morningside. The air is as clear and pure as in our own home village. It may be hot in the lower city, but it is never oppressive here. It is only a step to Grant's tomb and the lordly Hudson. What a restful change it was for us of the inland village whose river was a purling brook to sit of a summer's night on the heights above the majestic river watching with never a feeling of weariness the myriad lights twinkling for miles up and down the river or following the progress of the Albany boats or noting the contour of a war vessel or two.

We had four rooms, but Mrs. Countryman thinks that we could have got along just as well with three. We had not come to "keep house," but to rest. And it was a restful vacation. If there was a rather tiresome jaunt on one day, such as the hike to the Bronx Park or down to the lower East Side or one of the beaches, we rested the next day and without having to be "dressed up" for company—that is, Mrs. Countryman and Aunt Azalea rested; Mr. Countryman was too much interested in the delights of the great libraries to let any occasion slip by that offered an hour or more in the reading rooms of Columbia or of the new city Library on Fifth avenue.

It was a month of solid comfort and real recreation. We really saw all that there was to be seen in New York. Not just one hour, but days, were spent in the Metropolitan Museum of Art and the Museum of Natural History. Not a hurried run of a half hour over a sea-going vessel, but hours spent in wandering over the Olympic. On each trip we met "sightseers" on such vigorous "vacationing" of the old-fashioned sort that it would take all the next winter at home to recuperate. Space is lacking to give any adequate idea of the impressions made during this month of study and pleasure. The impressions, be assured, were real and lasting.

Was it hot? No, on the contrary, it was delightfully cool and pleasant. Even on those rare days when it was uncomfortably warm down on Wall street or Chinatown, we always found cool breezes "up home" on the Heights. Why, New York proved to be the most delightful summer resort it has ever been our good fortune to know! It combines all the advantages and attractions of the city with all the pleasures of a seaside resort. Is it healthful in the city? Strange to say, Mr. Countryman himself has always found New York as healthful a place as the pine regions of northern Michigan. For some reason or other, perhaps the salt air together with the purity of the atmosphere out on the Heights, asthmatic troubles disappeared. This statement, however, should not be taken as a guarantee that every one so afflicted will find a cessation of their troubles in visiting the city.

And now the supreme question which will be asked by those who may feel the same financial pressure felt by Mr. Coun-

tryman—was it expensive? We found to our surprise that living in New York during this one month at least was less expensive than living in our home village. This may be explained possibly by the fact that the home village happens to be a college town and college towns are notoriously expensive. We eschewed beef and pork for the most part, because we could get those foods at home; but fish was plentiful, cheap and a luxury to us inlanders. Vegetables and fruits were generally no higher in price than at home—indeed the fruits were of a finer quality and cheaper. We prepared our breakfasts and most of our dinners at home, taking other meals where we happened to be. Eating was as it should be, an incidental to the vacation, not the main show. Neither were we compelled to be on dress parade as we would have been at a hotel; we enjoyed the luxury of dressing for comfort entirely. And, best of all, when we left for our home village, we were rested, really rested. Not only that, but we came back home loaded with a storehouse of vivid, clearcut impressions and memories that have served as a stimulus to work and thought.

For the benefit of skeptics I give the actual itemized list of our expenditures for the month exclusive of railway fares to and from New York: Rent, $35; food, $25; fuel and light, $1; house incidentals, $1; carfare in the city, $10; incidentals, $5. For ourselves, we found that the city rental was balanced by the amount received from Mr. Cityman for our village house; the food and house incidentals cost no more than at home; so that, aside from our railway fare, our sole additional expense was the ten dollars for carfare and five dollars for incidentals.

Our summer's experience had therefore proved that the countryman of moderate means could take a long vacation in the city; that he could do so and still have all the comforts and privileges of home; and that he could enjoy a respite from the ordinary routine of life in a country town at a very small expenditure. Our experience has been such that we are constrained to repeat the experiment in Boston or some other large city next summer.

Oxford, Ohio. EDWIN S. TODD.

Dining at Three.

When one reads in the reptile book that the agile and graceful black snake devours mice and toads and other reptiles as its favorite fare, the story is mildly amusing, and will possibly be remembered until the next interesting fact comes to replace it. I find that it gives a quite different impression to stand over the black snake as he is earning his afternoon meal.

I chanced to be where I could watch this most interesting process for a quarter of an hour the other day. Noticing a great commotion at the side of the road, I dismounted and began to poke about. All that could be seen at first were two lashing tails, some five feet apart, but when the weeds were separated, the confusion resolved itself into the orderly procedure of a reptile dining room. The smaller reptile proved to be a good sized and vigorous garter snake, but he was fast losing his identity. As a last desperate resort, he wound his tail into a firm knot around the weeds and grasses, and as I watched, the black snake made his dinner up to the point where the knot began. There his progress was checked. I touched his head with a stick, and quick as a flash he jerked backward about a foot, reconsidering his dinner.

When no further danger seemed to threaten, the meal was resumed, as far as the knot. The black snake tried the tail trick of his victim and took a good pull, but in vain. It began to look as if the diner would have to await the will of the dinner. But, no, the black snake had taken other meals of the same stubborn sort, and had other resources. How many I do not know, as one was sufficient. He abandoned the pulling process and began to coil and roll himself about in the grass, no more regarding my feet than as tho they had been stones. It appeared once as tho he was going to coil his tail about them for another pull. The coiling, turning process seemed almost to have brains back of it, however, as it gradually untied the knot in the smaller snake, and in a few minutes there was no obstacle in the way of completing dinner, already two-thirds over. But, right here, the indifference to having a spectator suddenly ceased, and the victorious snake darted away with incredible swiftness.

CHARLES A. DANN.

Croton-on-Hudson, N. Y.

Thoreau's Country.

A delightful volume might be written about primitive Maine. Indeed, Thoreau has immortalized it in *In the Maine Woods*. He speaks of the bit of a store that stood at the forks of the roads, one of which went unerringly north into the Big Woods of Aroostook. I took a snapshot of the little store on

one of my recent vacations, and it is the very store where the teamsters who hauled goods traded before the Bangor & Aroostook railroad was built. The building was burned soon after, and I think it probable that I took its last photograph.

Of a summer filled with delightful association with the people of that region one casual experience stands out more clear and in a more romantic light. Searching for a place to fish, or to pretend to fish while loafing in a boat, we came across Coma and the unique steed pictured. Coma was a clever French Canadian, living in a little shack by the pickerel pond, where he fished in summer, and cultivated a few small vegetable patches among the stumps and rocks, while in winter he "went into the woods." Everybody in Macwahoc of the male kind goes into the woods in the winter, except Marcus Aurelius Hopkins, who keeps the store (not the Thoreau store).

THE STATE OF COMA

Coma was a good-natured fellow, and we persuaded his wife to get us a lunch, for an excuse to leave a dollar. Asking about the farming operations we learned that Coma's motive power was a fine, big, sleek red steer and that he was used as cart horse, plow horse, and carriage horse. Coma thought we were a bit skeptical, and stepping to the door uttered two or three sharp words in French, waited a moment, and then darted out into the clearing. In another minute he rode up, astride the steer, who had started for the shack the moment his master had called. Nothing then could stop Coma. He was on his favorite hobby, as well as favorite steer. He volubly bragged about the steer and told how he pulled the plow, hauled the two-wheeled cart, took him to market, etc. To prove his words he put the harness on the beast and hitched him into the top buggy. He took me out onto the Big North Road, and made the steer show his paces. He did go like the wind, and was as docile and mindful of the rein as the veriest old Dobbin in all New England.

That is a delightful country. We took no guns, but went hunting for the moose and deer just to get a look at them. We saw no moose, tho we followed one's tracks for miles. We saw several deer. We lived in a small log house with a big fireplace; tramped, smoked, fished (but caught no fish); visited with the people, encouraging them to talk, and went picnicking with all the neighbors we could persuade; took on some flesh and much serenity of spirit—thanks largely to the simple philosophy of Coma, who probably did not see a hundred dollars a year, and to the bread, pies and doughnuts baked for us by the capable wife of Marcus Aurelius Hopkins.

Glen Ridge, N. J. GEORGE FRENCH.

Homesteading.

"The Claim" is a homestead in the lake region of Minnesota, in the heart of the North Woods, and on the very top of the divide that separates the waters that join the Mississippi from those that flow to Hudson Bay. Our log cabin is on the shore of a beautiful little lake, with high, wooded banks and waters so clear that you can often see the gamey black bass rise to take your hook. Within ten miles there are twenty other lakes of all sizes and descriptions. The nearest town is ten miles away.

Here our experiences have been many and varied. We have seen squirrels and mice so tame that they would eat out of our hands; we have frequently had to chase the family porcupine out of the cupboard; we have scared deer in the morning from the grass

at our bathing place; we have been thru forest fires, and have gone along the trail carrying fresh venison with a hungry wolf howling in the woods behind us.

Last summer two of us spent our vacation on the claim, hunting, fishing, rowing, and tramping over the country for miles around.

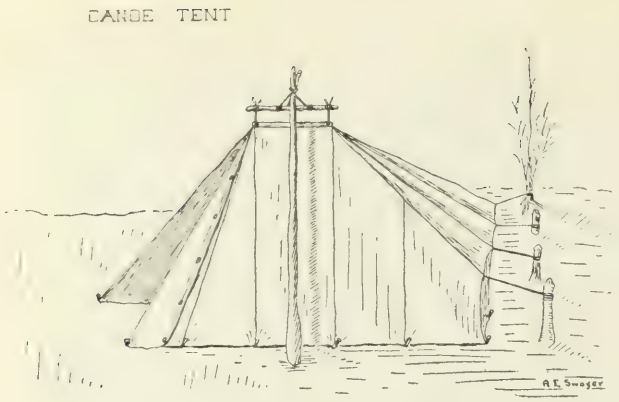
We lived out of doors day and night, eating at an outside table or in the boat out on the lake, and sleeping in bunks in the clearing, from which we could see the moon rise slowly over the Norways on the shore and make a path of moonbeams across the lake below. We were lulled to sleep by the murmur of the wind in the pine trees and the sound of the waves on the shore.

THE THOREAU STORE IN THE AROOSTOOK

The cooler days we spent in exploring the rivers and lakes, the woods and trails; and bona fide explorers could hardly have felt more satisfied than we when we discovered something hitherto unknown to us. Sometimes on a large lake we were Columbus looking for land; at other times we were French voyageurs looking among the reeds and wild rice for the inlet of a lake, up which we wished to paddle our canoe.

We ate of the leaves of "that little vine, Wood Magic," and became enchanted by the "charm of the wildwood"!

Snohomish, Wash. MARGARET ARNOLD.

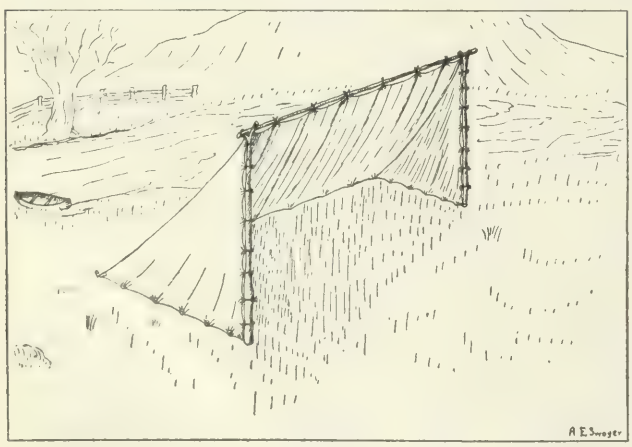


Canoe Cruising.

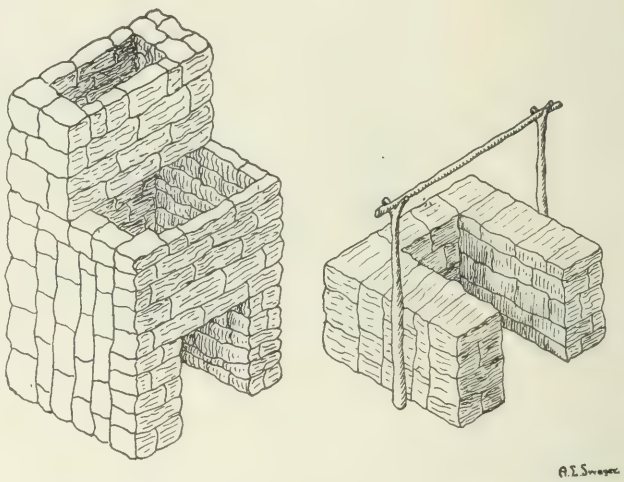
It is difficult to imagine a more pleasant way of spending a summer vacation than in a camp-and-canoe trip along our inland waterways; it's a combination of exploring and of "roughing it" hard to surpass.

The first thing, of course, is to map out a route along safe and well-traveled streams; you may be an expert at handling your craft, yet find unknown rapids and long portages difficult to negotiate when she is loaded with camping paraphernalia. Moreover, if you follow such a course and destiny decrees that you be caught in heavy storms or meet disaster to your food supply by an awkward upset, you will still be able to smile over circumstances which might otherwise spell ruination. There still remains the selection of your outfit and supplies. It is easy to forget the one essential whose absence mars the pleasure of the outing, or to burden yourself with enough supplies for an army—one-half of which will be of no practical use!

Consider, therefore, whether you are going to rough it more or less and wish protection only from sudden heavy storms, or whether you will make a more leisurely journey, stopping for a day or more in spots which please you. If the former, no regular tent need be carried; in its place secure a rubber poncho for each member of the party. These are pieces of rubber cloth, about five feet four inches by seven feet six inches; when traveling on rainy days they may be worn as capes, while at night they may be utilized to form a shelter tent. Such a tent, in which but one poncho and two end pieces are used, is shown in the lower illustration; with two, another side may be rigged from the same ridgepole, forming a better protection. If your stops are to be of longer duration, then you need more headroom and space generally; this is provided in the form of tent shown. Such an affair weighs about eight pounds, and, if set up as illustrated, no poles need be carried. Whichever form of shelter you adopt, do not sleep on the bare ground. If your tent is pitched on a side hill you should select the leeward slope and dig a trench to carry off rain water.



Let your clothing be plain, old and



strong; an outing flannel shirt with trousers of khaki or corduroy is a good combination. Carry an extra set of underwear and several pairs of socks. Mocassins are convenient as a rest shoe about camp. A pair of blankets and a poncho for each member of the party should be taken.

Aluminum kits containing a large number of articles nesting into each other and requiring but little space may be obtained; you can even carry a complete stove, made on the take-down pattern. Yet an excellent fireplace may be built of field stone in a few minutes, and a good cook can perform miracles with aid of a simple frying-pan. Two types of stone fireplace are illustrated, the one on the left being perhaps better adapted for use in permanent camps; in it the fire is fed thru the lower opening, the pan or kettle rests upon the ledge and draft is provided by the higher chimney opening, which also keeps the smoke out of the cook's eyes. The other fireplace will serve for boiling in a small kettle suspended from the cross-piece, and after a good bed of coals has formed, frying, broiling or roasting upon a spit may be managed without inconvenience from the smoke. If no stone is at hand, then two green logs rolled close together with the fire bedded in between will serve.

Actual cooking utensils needed will be a small covered pail or kettle, a coffee pot and two frying-pans; the kettle is indispensable for the making of all kinds of stews and chowders, or it may be covered with hot embers for use as a Dutch oven, efficient for all sorts of baking or pot-roasting. The two frying-pans are not altogether necessary, altho one may be used for the cooking of fish and the other serve its purpose in the preparation of various flat breads, pancakes or flap-jacks. For each canoeist a tin cup and a tin plate may be carried, together with knife, fork and spoon; a dozen or so of those wooden plates which are destroyed after use will provide for all additional needs. The rest of the equipment may well consist of one small camp axe for driving tent pegs, cutting firewood, etc.; one large hunting knife, for dressing fish and slicing bread; two cakes of soap (clean river sand will do for scouring pots and pans); two towels for each person, with two more for dishes; a small medicine kit; a can of canoe glue; a few patches, needles and thread; bathing suits, fishing tackle and a kodak.

THE SIMPLER FORM OF CANOE TENT

FIREPLACES, PERMANENT AND TEMPORARY

The food supply has been left until the last. The list given is intended to meet the needs of two persons for two weeks, provided that fruits, vegetables, butter, eggs and milk are purchased on the route and that the rods of the party are capable of adding an occasional fish to the menu. Twelve pounds of flour, three pounds beans, five pounds cornmeal, five pounds sugar, half-pound baking powder, one pound coffee, one pound oatmeal, one pound sweet chocolate, six pounds bacon; salt, pepper and spices. Should you wish to make yourself entirely independent of local supply, desiccated fruits and vegetables, condensed milk and similar items must be added.

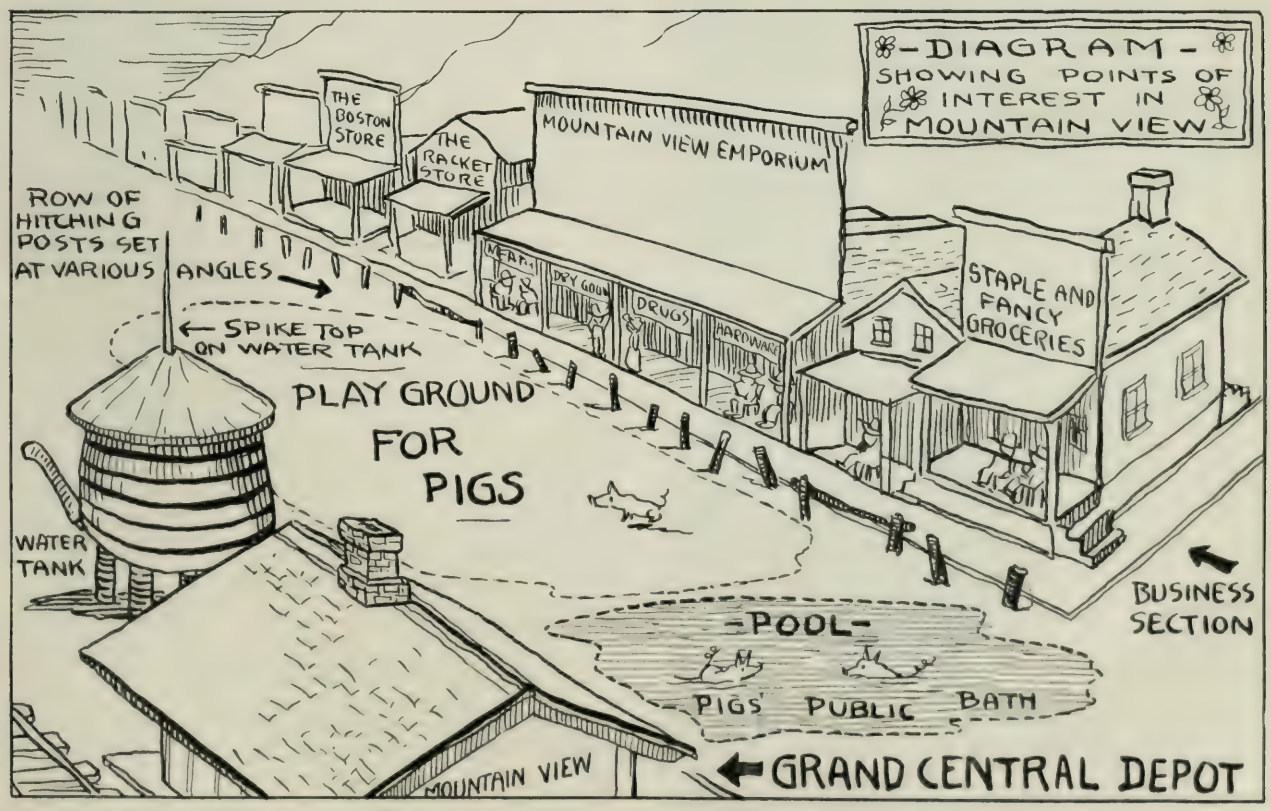
Having selected your outfit, some early morning before the sun has been up long enough to warm the air uncomfortably you load your canoe, dip your paddles into the

glistening water and are off. You wind in and out under arching branches, now and then stopping to cast a fly upon some favored pool; you slip past broad meadows and beside winding highways; you glide thru quiet water or rush dizzily down miniature rapids. Occasional water-fowl rise before you, screaming; muskrats swim sturdily across your bows and dive under the sheltering bank; now and then a large fish, searching for his breakfast, shatters the placid surface into widening ripples of silver. In the quiet reaches turtles slide noiselessly from the logs, and a big frog strikes the water ker-plunk—if you don't see him first and add frog's legs to your larder! Every turn of the stream opens a new vista of possibilities.

Meals of freshly caught fish, crisped to a golden brown; green corn and potatoes roasted in the embers, and hot corn bread, such as a canoe trip like this richly affords, can't be had at Delmonico's or Sherry's, nor would they taste one-half so well there.

The ladies of the party go a-berrying and by their wiles secure a pail of foaming milk from the cow of a friendly farmer. Ripe strawberries, the dew still on them and sweeter far than any cultivated variety; a fish so fresh that he has barely ceased to wriggle as he is popped into the frying-pan; hot flap-jacks and steaming coffee with real cream—does it tempt you?

These are some of the joys of canoe cruising. Of course, there are troubles, too—a rainy day, an upset, a tent blown down—but what are they save obstacles to make our enjoyment the sweeter?



Honesdale, Pa. A. E. Swoyer.

Loafing in Mountain View.

Two dozen store buildings in a row, fronting upon a rickety board walk and upon a large barren square full of lean and busy pigs; a railway station as the center of the square, and back of the row of stores some scattered cottages and several wooden churches—that was the town of Mountain View. The same humorist who gave it the name (it was the only place in the county where there was neither a mountain nor a view) probably was the landscape architect who laid out an open space between the stores and the station house as a playground for the "razorbacks." There was ample space in which to exercise, with no impediment anywhere but some hitching posts set at a variety of angles from the perpendicular; there was the platform for shade, and pools of muddy water—pigs' public baths—to give the municipal plans completeness.

"What is there to *do* in such a place?" the curious ask.

And I triumphantly repeat the question with the accent on the *is*. My passion in vacation season is to dodge "things to do." Of all the outdoor sports that are within the reach of an ordinary purse, the one that seems to me to come nearest to being pleasure unalloyed is loafing in a backwoods country town.

We didn't hunt or fish, my comrade and I. We didn't even take photographs. After a year in the madhouse atmosphere of a newspaper's "local room" what we sought in vacation time was a change. Mountain View filled the need by holding out nothing but possibilities for relaxation. We watched the pigs, played mumblety-peg, listened to discussions of the ancient history of politics, traced local genealogy, drove in the woods or went on lazy walks. A large share of the time we simply sat on the front veranda of the hotel and smoked, enjoying the mildest possible adventures in contentment.

The railway station, with its subsidiary watering tank, is the point upon which all eyes converge. Of an evening, a tour of the board walk in front of the stores would discover that all chairs faced toward this center. If a sudden upheaval of the earth should violently catapult every one out of his chair some night, it would pile the whole male population of Mountain View face downward upon the spike that surmounts the tank.

The choicest part of the day was when we sat on the porch after dinner and smoked and gossiped to the accompaniment of a fascinating drip of water, leaking from the tank. All of the town but the landlord and ourselves went to bed early. The taste of the cool night air and the transformation of the square when it was silvered with moonlight usually kept us up a little later than the rest. And always the evening would end in some such colloquy as this:

"My wife has went to bed," the landlord would remark.

One of us would nod.

"The boys turned in a leetle after that, 'gin they want to be up early tomorrow."

Again we would appear to be uninterested.

"All the guests except you uns are in," he would continue, still tactfully. "It's gettin' late."

Not very late, we would argue—only a little past nine.

"But don't you uns see," he would plead, "that *I* can't get to bed myself till you uns are put up?"

No further use to combat! And each day closed with a sigh of mingled reluctance and contentment as we followed the landlord's lantern up the creaking stairs.

Kansas City, Mo. PAUL KYGER.

A Golf Pastoral.

The summer plans of college professors, even in wealthy Iowa, may be hampered by lack of surplus millions. For this reason, "Mart" and I took a most unassuming cot-

tage fronting a lonely Iowa lake—to fish. Shades of infatuated Izaak Walton! Children with canned sweet corn on pins pulled in more carp and catfish in an hour than we with all our tackle caught all day; the pleasant excitement of untangling tight and slimy knots of eel and fish-line by the glimmer of an evil-smelling lantern is offset by the difficulty that remains of extracting the hook from your thumb. One six-inch soft-shelled turtle in the morning scarcely recompenses two hours' labor of four adults and three children in preparing fifty yards of "trot line" the night before; and four hours' toil pearl fishing is ill paid by reproachful glances from the entire family. How did you know it would go thru a hole in your pocket? Wasn't that your wife's fault, anyway? But not until the noisy gasoline launch, on the single occasion that it deigned to run, cut up the only big pike residing in the lake were we finally driven to the woods.

I should draw the curtain over those dark hours following our return from same woods with bouquets of wild asters and poison ivy were not those the dark hours before the dawn. In a moment of lucidity, during his convalescence, good old Martyr rose and twitched his face of blue: "'Tomorrow to *fresh* woods and pastures new.' Why not lay out a golf links in the cow pasture?" Why, indeed? These pastures, sweeping in many undulations from the mile of sorgum field bordering the lower end of the lake to the acres of field corn stretching far as the eye could see across the uplands, were specifically shaped at the creation with golf in mind. Thus in a flash our summer program was complete.

Half the fun of golf is in laying out the course, and our nine short holes (suited to the carry of our four clubs—all approaching irons) could be new planned and altered at will, as fresh possibilities presented themselves. And the possibilities were infinite. We enjoyed the clearing away of a teeing place among the stunted goldenrod on a certain windy height, where one afternoon an eagle floated across so low that we saw the white in his side-tipped eye; we enjoyed perfecting "Number Two" putting green, our only really good one, in the moist corner by the orchard. There was real pleasure in plying jack-knife and iron spoon in the brick-like earth on "Number Nine." This was on a mound said to be the loftiest point in half a dozen counties. What part of our day offered most delight it would be hard to tell. There were the crisp mornings when down on "One" we played "mental hazards" only twenty feet from the doubtful, censorious eye of a big Guernsey bull,

and upward of eight-seven feet from sanctuary beyond the fence. Then would *fidus Achates,* from the distance, counsel: "Keep your eye on the ball; I'll let you know when he comes." There was the daily "championship" round just before lunch, when even the gophers were quieter along the hills, and the cattle stood bunched close up to the fences built about the Porter apple trees. A Jersey heifer, stretching neck and tongue and eye in an effort to reach the forbidden fruit, would twist back her head thru the fence and gaze mildly at us, as with grim determination we marched by—little dreaming that she looked upon the settling once and for all of the rival claims of Massachusetts vs. Iowa, or science against arts, or more momentous, mashie iron pitted against jigger. We looked forward, also, to the afternoons when the indifferent herd lay chewing the cud among the mullen and sweet fern on the heights, or in ones and twos grazed on the shady slope under the woods, or stood trampling and switching among the roots of two ancient fir trees away up by "Number Eight." This was the "consolation" round. But the best fun of the day came in the cool long evenings after the lowing herd had wound "slowly o'er the lea." Now the ladies came out for a foursome, and the children—a caddy to a club. There was, especially, one delicious evening, when a visitor followed each of nine fell swipes at the ball by a look of grieved surprise ere ever he knocked it off the tee. Hilariously we dubbed from hole to hole, until the gathering shadows hid the white rags that marked them, and little by little crept up toward the hilltops whence each night we watched the sunset.

Before us lay far misty reaches of the valley—miles of cornfield and cane and forest cut by the winding silver of the river. From behind, out of the gloom of the woods, came at intervals the klink of cow-bells, the intermittent wail of the whip-poor-will, and from a greater distance the whoo hoo! oo-oo-oo-hoo! of a great horned owl or perhaps even the bark of a wolf.

At length, after groping for our scattered clubs, we would pick our way down into the shadows, thru the fences, among the barns and hay-stacks where loose horses stirred ghost-like, to our veranda. Too tired, thank goodness, to go fishing, we smoked and talked and listened to "jug o' rums," and to the smacking of poor silly fishes feeding on the surface of the water. Then, all too soon, it came time for the big, cool watermelon and the goodnights. And the good wife adds, "Do you remember how you held the wire fences for us girls to crawl thru—great big fatties?"

Cedar Rapids, Iowa. J. H. SCOTT.

On a Homestead.

After graduating from the University of Nebraska and spending a year teaching, we moved to the northern end of the Black Hills of South Dakota, where I had taken a homestead. We knew it would be a decided change for a city girl, but my parents were with me, and it had long been my cherished dream to own a quarter section of government land; otherwise to have a tennis court.

My homestead is ideally located about four miles from town. Half of it is covered with pine trees, with a few ravines where grow oaks, hawthorn bushes, buffalo berries and wild roses; the rest is a rolling slope, where we broke virgin soil and tangled grass roots for farming. Mariposa lilies, violets, bluebells and other wild flowers bade us welcome, as on the anniversary of the battle of Bunker Hill I began my vacation by digging the first shovelful of dirt for the foundation of our new home. Right in the heart of the fragrant pines we built our house, facing the east. Mother and I took the team to help gather stones for the concrete walls Father was putting up. How we laughed and tugged over some big rocks deeply imbedded! Toiling under Nature's canopy, developing a little muscle and endurance, seemed to banish forever the city's smoke and the stifling chalk dust of school rooms.

Later, when the beaver board was on the rooms, I began the fun of decorating. Painting the ceilings was invigorating. Since I was a novice at this work, at first a goodly portion of the alabastine tints trickled down my elbow. Yet final results were really gratifying. The wide front porch was our joy and pride continually, as a comfortable living room or sleeping apartment. From refreshing slumber in the open, the rosy sunrise or a frolicsome kitten or puppy would waken us to the beauties of a summer morning. Our fresh vegetables were a source of blessing. Oh, the luscious melons grown on sod!

Our piano was rather a novelty to some more isolated neighbors whose only music had been the howl of a coyote. Invariably they asked me to "play a tune." We often rode into Belle Fourche for the mail, or for a moonlight ride on the river, or for the ice cream which is a luxury to homesteaders—"honeyockers," as they call us here. We had pleasant jaunts to Spearfish, including the picturesque canyon trip to Deadwood. When friends came out from town we had lively tennis games, or a gallop over the hills. One cool moonlight night we gathered about a snappy log fire in a broad ravine to roast marshmellows.

Thus our first sumer of "holding down a

claim" passed quickly and pleasantly. When fall came I resumed high school work with renewed energy, teaching in town and riding back and forth each day.

LAURA R. MCCUTCHEN.

Belle Fourche, So. Dakota.

A Week in Devon.

It was a contented group of travelers that started from Salisbury for Okehampton one morning in July. I say it advisedly that they were starting for Okehampton, for with the intricacies of English traveling one never knows just where one is going. We had studied our good friend Baedeker and had found out how many times we would have to change cars to reach Okehampton. Changing cars is a constant factor in English traveling. We always took "quite the best train," and always changed one to four times in going a hundred miles.

We left about noon, and intentionally omitted luncheon, for here was an opportunity for one of those delectable luncheon baskets which are a consolation for many other inconveniences. It is appetizing when it is brought to your compartment with its chicken and lettuce, fresh bread and butter, cheese, hot tea and plain cake, all daintily arranged in a wicker case.

It was still early in the afternoon when our train came into the Okehampton station and we caught our first real view of Devon —the land of clotted cream and luscious strawberries, the land of climbing roses, the land of Lorna Doone. The little station is perched high up on the hills, and the little village nestles down in the valley, surrounded by purple moorland.

We could hardly wait for the morning to see our innkeeper's energetic daughter's cousin about a horse and cart for our first drive. We liked everything—the amiable ambling animal, the bobby two-wheeled cart, the promising wicker lunch basket stowed away in front, the dusty, crooked streets of the village. Then when we drove out along the shady Devonshire lanes, with the high hedges of honeysuckle leaning so far over on either side that we could pick bunches of the pink and yellow fragrance. And when we looked beyond those hedges to the browns and purples, the blues and pinks of the moors, and then drove thru a tiny tinkling brook which flowed on undisturbed across the roadway, or stopped under some wide-spreading oak or graceful elm to save ourselves from the too bright sunshine, we were grateful for that leisurely spirit which prompted us to forsake even "quite the best train" and give ourselves up to the joys of country travel. What tho we had our troubles that evening to find lodgings at Bude? We did find them in the end—a neat little house, all flower-bedecked, looking out on the "downs" and the sea.

WASH DAY ON THE HOMESTEAD

Such a beautiful morning as we opened our eyes on, and such an eighteen mile drive to Clovelly as we had! Up and down lovely country roads dotted by tiny white-washed or pink-washed houses, with roses clambering over the roofs and sides, the little green fields with the white sheep, the hills in the distance, which always made me think "For every beast of the forest is mine and the cattle upon a thousand hills," and now and then a glimpse thru the trees of the gray old ocean—all made a drive which is a beautiful and often recurring memory. Then our driver was so entertaining. He had told his stories to all his passengers, but he put so much zent and freshness into them that you imagined they were new for you. Here was Stowe—the site of Sir Richard Grenville's home—and there Stamford Hill, the place of another Grenville's victory, and over there across the water was Lundy's Island, that famous nest of outlaws and smugglers. We were told that if we only looked closely perhaps we could see the Montague, one of the royal vessels that went aground some time before. Our driver was so insistent upon our seeing it that we really imagined we did see the dark sides of the half-sunken vessel, and then he stopped and we were at our journey's end.

It is useless for me to tell you what that first glimpse is like, the street so narrow that with outspread arms one can almost touch the houses on each side, the fuchsia hedges so tall and the blossoms so brilliant that they seem unreal, the geranium bushes sending up their pink and red blossoms to nod in the second story windows, and, far below, the masts of the vessels.

Clovelly's one crooked, winding and ever-changing street is not unknown to tourists. The high sea-wall, the nets hung up to dry, the fishermen in their blue jerseys—all made a picture not to be forgotten. They are enterprising, these fishermen, and when one can go in a fishing smack for a shilling an hour, of course one goes and climbs down the rock-hewn steps with a timidity that only the ocean can give. And out beyond that wall one can look back at Clovelly. There is a description of the scene in "Enoch Arden":

> Long lines of cliff breaking have left a chasm
> And in this chasm are foam and yellow sand,
> Beyond, red roofs about a narrow wharf
> In cluster; then a moldered church; and higher
> A long street climbs to one tall-towered mill,
> And high in heaven behind it a gray down
> With Danish barrows; and a hazel wood
> By autumn nutters haunted, flourishes
> Green in a cup like hollow of the down.

Our fisherman may not know his Tennyson, but like every fellow villager he knew and loved Charles Kingsley and his *Westward Ho.*

Oregon Hops.

> Hops and song and laughter
> Filled this week added to memory's store,
> And many a day hereafter
> Will be brighter for telling it o'er.

Is not that an ideal vacation? Many of us to whom fortune denies long periods spent in mere pleasure need not, for that reason, miss a real vacation, for in the hop-fields of Oregon are to be found the essentials such as good companionship, bracing air, invigorating odor, outdoor exercise, excellent appetite and freedom of expression added to remunerative labor.

It is work for all ages. Little eight-year-old George competes with grandpa for both pleasure and profit and finds beauty too; for Nature, apparently grateful for the man-supplied support, festoons the wires with long, graceful clusters in holiday style.

It was a rainy September morning on which we started bright and early, lunch baskets in hand, but what cared we for the rain, a shower now and then adds to the zest and—incidentally to the profits—as water on the hops increases their weight; so if you haven't time nor desire to seek the shelter of the "drier" just cover up with sacks and sing until the sun comes out, then pick fast and you will earn more for the rest and the water.

Keep up a jolly or instructive conversation with your partner on the other side of the long row and you will forget the time and the sun on your back. The incentive of the chase is here too—don't let your partner get all the fine clusters at the places where the sides are indefinite. See that long hanging vine filled its full length with clean hops—get there first, and don't let those young people on the next row pass you, if you keep close you may learn all the fun they are going to have with their hop money, and make a good friend too. Perhaps they are camping in the long bunk-house and will tell you of their jolly evenings, for we quit at five o'clock, if the filling of the floors of the "drier" does not stop us before.

"Wire down!" Yes, you were a second ahead of the conceited little fellow over there, for the man with the long hook is coming your way and now lets the high-strung wire drop some to enable you to strip the top clusters into your tall basket, and you realize that you are commencing to acquire the knack of the stripping process that marks the best pickers; be careful tho, for "the Boss" is coming, whose eagle eye will detect the dirt or leaves in your basket in spite of your jollying.

There! your basket is full to running over, and you need help to empty it into the

big sack which, when full, will be weighed and the amount credited in your little book.

A week of pleasant companionship, of working with Nature, of invigorating exercise in pure air and a purse heavier by fifteen dollars makes you feel that you have spent a profitable vacation.

Cornelius, Ore. MAMIE VAN EMON.

The Desert Oasis.

It is a difficult matter for one always surrounded by gardens and parks of choice trees and shrubs to appreciate the feeling, a sort of a reverence, the desert traveler has for a few dwarfed cottonwood trees.

In Nevada, just above the well named Death Valley, on the Amargoas Desert, there are occasional clumps of these hospitable trees marking hidden springs in an old dry river channel. With my husband, a mining engineer, I have had the experience of making numerous journeys across this Nevada desert.

It was the lure of gold alone which had tempted us, as it had tempted many others, to leave spreading trees with climbing vines, tall and evergreen pines, blossoming bushes and shady lanes by babbling brooks for the cactus and sagebrush on the gray and yellow sand of a parching desert. We were sometimes coaxed several miles away from our course in quest of the rainbow's end by a glimpse of beckoning cottonwood, that we might rest a while in their shade.

As we approached our oasis, before we were able to detect the camps beneath, we could see the little silvery leaves signaling as if each one was trying to outdo all the others in extending to us a welcome. They always keep open house. We rarely found them alone, and if we did the camper who had left his tent or cabin left also a welcome sign to whom it might concern.

After filling our canteens or water bags, leaving them to cool, we would lounge about examining specimens of ore, discarded perhaps by many a prospector to lighten his load on the sandy trail back to Goldfield or Tonapah, from Death Valley, the Panamint Range, or maybe from the old haunts of Mark Twain, just over the state line in California. At the bidding of the shadows, which were now growing long, we would all but resolve to relinquish the coveted gold to those more ambitious, for the distance was great to the next shaded spot.

These little trees require no official protection or the pleadings of bards to spare them. A word from all who have been sheltered by them from the rays of beaming sun would give us a volume. The journeying Indian, the weary prospector, with his laden burrows, the freighter with his twenty-mule team, the touring car of promoters and engineers, and the dusty passengers of the four-horse stage, with one accord laud the oasis of our desert.

On the Birth of a Child

By Louis Untermeyer

Lo—to the battle-ground of Life,
  Child you have come, like a conquering shout,
Out of a struggle—into strife;
  Out of a darkness—into doubt.

Girt with the fragile armor of Youth,
  Child, you must ride into endless wars,
With the sword of protest, the buckler of truth,
  And a banner of love to sweep the stars. . . .

About you the world's despair will surge;
  Into defeat you must plunge and grope—
Be to the faltering, an urge;
  Be to the hopeless years, a hope!

Be to the darkened world, a flame;
  Be to its unconcern, a blow—
For out of its pain and tumult you came,
  And into its tumult and pain you go.

New York City.

Can I Afford an Automobile?

By Albert L. Clough

Every one desires to own a motor car. This is a pretty broad statement, but its exceptions are few indeed. Time was, not so long ago, when the imperfections of the automobile and the prejudice against it would have made such an assertion untrue, but the former have been eliminated by the skill of the automobile engineer and the manufacturer, and the latter has been dissipated by familiarity with the new conveyance. Every one could own a motor car were it not for the dollars and cents side of the problem; it is this aspect of the question that is or should be of the greatest interest to the prospective automobile purchaser.

In a general way, any one who has from $700 to $1000 in cash, the income producing power of which he can permanently dispense with, and who can judiciously set apart $300 to $500 annually out of his income without being forced to curtail more necessary expenditures, can afford to own a small, unpretentious but entirely serviceable family car, capable of use for at least five seasons.

To own a more commodious, more powerful and pretentious car, not only must the original investment be doubled or trebled, but the sum set aside to meet the expense of keeping and running it must be increased somewhat in proportion to car weight and power, to cover the increased cost of tires, oil, gasoline, labor, registration and insurance.

The rough estimate given above assumes that a car is to be used not much in excess of 5000 miles per year, that it is carefully operated, and is attended to conscientiously, principally by the owner himself. It is also assumed that no serious accidents befall the car.

Two principal considerations govern the economics of motoring: first, the initial cost of a car, and second, the expense of maintaining it. In proportion as these two elements are minimized the automobile is brought legitimately within the reach of a larger proportion of those who desire it. When one buys a car, a sum of money is expended which obviously might otherwise have been invested so as to bring in an income of 5 or 6 per cent annually, and thus it is necessary, if one is to be candid, to count as one of the yearly expenses of owning a car a sum of money equal to 5 per cent or 6 per cent upon its total first cost. The important point here is that the lower the first cost the smaller will be the annual sum by which the ownership of a car reduces income.

As soon as a person takes possession of his automobile it becomes a "used" or "second-hand" car, and its selling value falls below the price paid for it, even tho it has not been run a mile. At the end of a season's use its value in the used car market has perhaps fallen to 80 per cent of its first cost; at the end of the second year's use to 60 per cent of its purchase price. These figures are approximate only, but are given to illustrate the fact that there is a progressive loss in the marketable value of a car at such a rate, perhaps, as to render it practically unsalable or salable only at a nominal price at the end of five years, altho it may still be perfectly serviceable. In short, the owner may properly figure that each year's use of his car costs him approximately one-fifth of its cost price; and obviously, the lower the first cost the lower is this yearly loss due to depreciation in marketable value. Occasionally a car is retained in the service of the original owner for a longer period than five years, and in such a case the yearly cost of keeping the car, due to its depreciation, is less than indicated above, but it is rare that a person cares to use the same car for more than five seasons, because the mechanical improvements and changes of style made in motor vehicles during so long a period cause it to become noticeably out of date and inferior to other cars.

One who permanently adopts the motor car as a conveyance should be prepared to make another expenditure about equal to his first at the end of five years or slightly later, when a new car is likely to be required. Modern cars, even the low priced ones, are, however, so durable, and motor styles are now changing so much less rapidly than heretofore, that it may

soon more generally prove practicable for original owners to operate their cars for longer periods.

Any one who is somewhat in doubt whether he can afford to own a car, and who at the same time is so constituted that he cannot be contented unless the car he drives is strictly up to date, should hesitate before becoming an owner, because the gratification of this desire involves the annual exchange of his car for a new one at an expense very considerably in excess of the yearly loss due to depreciation in selling value. If motoring is to be entered into with a regard for economic considerations, a person should make up his mind to drive his car even after it becomes somewhat out of fashion, providing it is serviceable and has not become unduly expensive to maintain.

There are certain other expenses incident to owning a car, which are independent of the extent to which it is operated, such as registration, and fire and liability insurance. In general, these increase with the horsepower of a car; the lower the power of the car, the less the outlay for these items. Registration fees cannot be avoided, and it is imprudent, especially for the owner who can just afford to own a car, not to protect himself against loss through fire or against losses due to the settlement of claims for damages accidentally caused to persons or property. In many communities automobiles are taxed as personal property, and this item of expense is greater in proportion as the price of a car is higher.

The above mentioned annual items of expense are of the character of fixt charges and depend directly upon the first cost of a car. The other class of items are operative expenses and depend mainly upon the extent to which a car is used, the manner of its operation, and the willingness or ability of the owner personally to perform certain services which would otherwise have to be performed by hired labor. Among these, tire expense is a large factor, and increases with the weight, horsepower and speed of a car. A light, low-powered car, driven at moderate speed, if it is equipt with tires of amply large size, exhibits the very lowest tire cost per mile of service. There is no large item in the cost of motoring that is more within the control of the owner than the tire item. If an owner is willing to drive at not over 25 miles per hour over perfect roads, and not over 15 miles per hour on poor roads, and still slower over bad spots and around corners; if he is careful to keep his tires properly inflated at all times and to make his own minor tire repairs at once upon their being needed, the useful mileage of his tires will be so greatly prolonged that his per mile tire cost will be minimized. The neglect of these precautions will burden him with an unnecessarily high tire expense.

The outlay for gasoline is least for a light, low-powered car and is proportionally greater in cars of greater weight and power. In general, a six cylinder motor is somewhat less economical of fuel than a four cylinder motor of the same horsepower. Fuel consumption, like tire wear, increases rather rapidly with the rate at which a car is driven, and at speeds of more than about 20 miles per hour it becomes increasingly excessive. In general, the larger the motor the greater the necessary expenditure for oil; a six cylinder motor consumes oil somewhat more rapidly than a four cylinder motor.

Repairs have become a very small factor in the maintenance of all modern cars of well tried design and honest construction. Years ago, the large and unpredictable repair expense rightly deterred the average person from buying a car; but now the purchaser of a car of mature model, built by experienced and responsible manufacturers, need have no apprehension of extensive repairs if only he does his part to forestall them. This statement applies to all cars, low and high priced alike, which are driven at not above 20 or 25 miles per hour, which do not figure in accidents, and which are intelligently and conscientiously cared for. It applies to high-priced, high-powered cars even when driven at the high speeds for which they are intended, but does not apply to low-priced cars which are driven at speeds to which large touring cars only are adapted. The operation of small cars at high speeds near the limit of their power, over all kinds of roads, violates not only the prime re-

quirements of economical operation, but all considerations of safety and comfort.

Fast driving and neglect are the two evils that make repairs necessary and shorten the life of a car. The failure to keep in a tight condition all nuts and other fastening devices and to keep well oiled all moving parts, however obscure and seemingly unimportant, are the most usual and most harmful directions in which neglect is manifested. The life of a car can be almost indefinitely prolonged by intelligent, unfailing lubrication of all parts that move relatively to others, and it can be shortened to a pitiful fraction of its normal length by the lack of oil. Every user has it within his power on the one hand to keep his car efficient and smooth running after years of service, or on the other hand to make it a noisy, incapable "rattletrap" before its first season has been completed. It is only a question of a few dollars' worth of oil in the right place at the right time.

If an owner keeps his car in a public garage, calls upon hired mechanics for assistance whenever oiling is required or whenever some little adjustment is necessitated, and has it washed and polished frequently by garage attendants, his season's outlay for these services will aggregate a surprisingly large amount. From the economic standpoint the ideal owner is one who has a little time and a strong inclination to care for his car and a convenient but inexpensive private garage in which to keep it.

In order that an owner may intelligently drive and care for his car, it is absolutely essential that he should understand it thoroly in principle and in detail. This requires the reading and study of the best current automobile literature and practical instruction from a well-informed motor car mechanic. The best and most economical results can never be obtained by an owner who is ignorant of his car, no matter how good the car.

In case space is available, it is wise economy to build a small well-appointed garage, provided with artificial heat and so equipt that a car can be conveniently washed therein. The man-of-all-work or some one in the family can then do the washing and one considerable item of expense thus be eliminated. The making of adjustments, oiling, the performance of minor mechanical repairs and the repair of tires can be effected by the owner, if he has a little time at his disposal, and to most men work of this kind forms a diverting and restful avocation.

Experience has shown that a small car of good quality, carefully driven and attended, can be operated at an operating expense of about ten cents per mile or slightly less, including registration, insurance, tires, fuel, repairs and all such items, but not including interest and depreciation charges. If such a car is of the five-passenger type, as it may well be, the maintenance expense per passenger per mile, while it is run fully loaded, does not exceed two cents—a rate comparable with railway fares.

Manchester, N. H.

The Last Mile

By Stokely S. Fisher

The day is over. How strange to think of morn as afar!
But we are weary; lonely the pathway we roam;
Now there is song as at dawning, and lo! the evening star:
Oh soon we shall see the welcoming light of home!

The gladdest hour of the journey is ever the last short mile,
And better than the beginning the end of years!
Never was babe born smiling, but lips of the dying smile;
And the infant weeps, but the dying shed no tears!

The last mile!—Let us go as we used to down the lane
To the gate of the little cottage,—no doubt, no dread;
Oh if we kiss and part, on the morrow we meet again,
And sleep shall be sweet with dreams till the night is fled!

Kansas City, Kan.

The South American Tour

Why, When, and Where to Go, What to See, and How Much It Will Cost

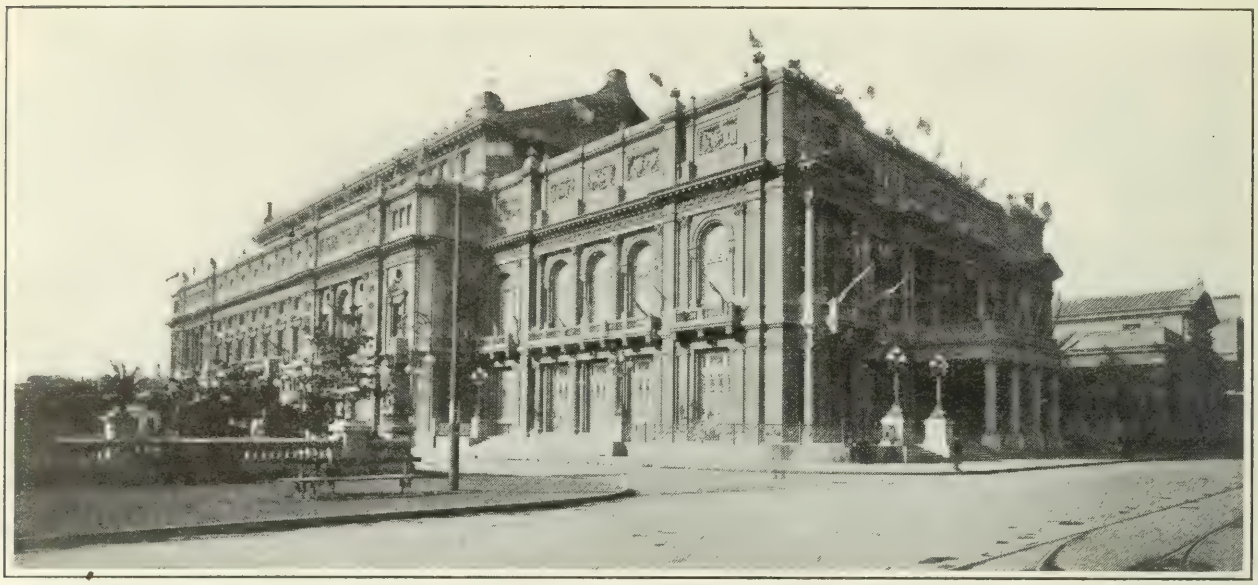
By Annie S. Peck, M.A.

[It is strange that the American tourist, usually enterprising in seeking new pastures, has so generally neglected the countries south of us. He has recently extended his purview as far as Panama, but still he hesitates at crossing the line. With the object of directing attention to the attractions of South American travel we have asked Miss Peck to answer some of the practical questions that come up whenever such an idea is suggested. Miss Peck knows South America from top to bottom, especially the top, for she has for more than ten years engaged in mountain explorations, and has planted her banner—which bears the strange device "Votes for Women"—on some of the highest peaks of the Andes.—EDITOR.]

The South American Tour! *Como no?* Why not? as many Spanish-Americans exclaim, to give hearty assent. The popular cry, "See America first!" if not to be urged too strongly, should surely be endorsed when changed to "See America second!" After visiting the Old World, why not seek out the strange new world beyond the equator, to enjoy a novel and delightful experience?

Why?

For the lover of fine scenery there is some of the grandest on the earth: snow-clad mountains, beside which the Alps would be foothills and Mt. McKinley overshadowed; wondrous waterfalls, one surpassing Niagara both in hight and in volume of water; cliffs more lofty than those of the Yosemite; magnificent lake scenery, including the highest sheet of water where steamboats ply; strange yet fascinating deserts; superb tropical vegetation; the highest railroads in the world, the most picturesque and beautiful harbor.



If strange peoples and cities are of interest, there are towns old and quaint, with many buildings of centuries past, and cities quite up to date, growing with the rapidity of our own; a few places where Indians in curious garb are seen by the side of Paris gowns and English masculine attire, and others where an Indian with sandals and poncho would attract as much attention as on Broadway; cities with boulevards, parks and opera houses, finer than any of which New York can boast.

If ruins and antiquities are alluring, these also abound. Whole cities of the dead are there, and others where the new civilization rises above or by the side of the old. Temples, palaces, fortifications, ancient statues, mummies and pottery may be cursorily admired or profoundly studied; and search may still be made for hidden monuments of a bygone age. Further, these countries rapidly advancing, with astonishing mineral and agricultural resources awaiting development, with railroads yet to be laid, with fast-growing markets for almost every kind of merchandise, invite the trader and the capitalist to investigate hitherto neglected opportunities before it shall be too late.

As to the accommodations for travel, the various steamship lines supply every comfort and sufficient luxury. The railways have the usual equipment, sleeping and dining car, for long journeys, the hotels are fair to excellent in the larger cities where some time is spent satisfying the wants of all save the ultra-fastidious traveler.

"The South American Tour," which is rapidly becoming fashionable and popular, covers the most interesting and accessible portions of that continent, much of its finest scenery, its greatest cities. The Isthmus of Panama, the countries of Peru, Bolivia and Chile on the Pacific side, Argentina, Uruguay and Brazil on the Atlantic coast are visited by every one; with a traverse of the Andes in crossing the continent from Santiago to Buenos Aires or with the completion of the circuit of South America by sailing around thru the Straits of Magellan.

Obviously the voyage may be taken in either direction, but the sequence above given is by all means to be preferred. Thus made, the journey is one of ever-increasing interest until its culmination in the delightful harbor and city of Rio de Janeiro. Not, let me add, that Peru is inferior to Bolivia and Chile, or Buenos Aires to Rio, each place has its especial attractions; but taken in this order the scenes will be far more

THE COLON THEATER AT BUENOS AIRES

Argentina's capital is known to globetrotters as the South American Paris. Like the more historic city of the Old World, this capital has its beautiful boulevards, theaters, opera-house and newspaper offices.

impressive and even more enjoyable. The time allowed for the trip should be four months if possible, tho many have made it in three; all these, I believe, returning with the desire to repeat the journey soon.

When?

The time to go is the whole year around: for as the seasons beyond the equator are the opposite of our own one may arrange to escape heat, cold or March winds, or to suit his own business convenience. Also, since the extreme temperatures along the way are nowhere so great as with us, one may safely be in any city at any time. The west coast is always comfortable, but Rio may be avoided during the summer months of December, January and February by those who dislike continuous heat, tho the mercury there is never so high as frequently in the latitude of New York. Setting out in September or October, one may prefer to take the east coast first.

Where?

In general, tourists will begin with Panama, now reached by four lines of steamers. Soon travelers will sail thru the canal and down the west coast; but not to pause and examine the great work will be a pity. At Colon there is the beautiful new Hotel Washington, there are the renovated streets and dwellings, the interesting shops, the residence of De Lesseps on Christobal Point, now used as an office building, monuments to Columbus and Aspinwall, the new docks and the immense breakwater, coming out from Toro Point opposite, to protect the entrance to the canal. The great Gatun Dam and locks, the spillway for the discharge of superfluous water, and the lovely new lake will deserve a close examination, the Culebra Cut as well, while the quaint old city of Panama, the old sea wall, the shops and narrow streets, the cathedral and other churches, the Ancon Hospital and the Hotel Tivoli all merit attention. A four-mile drive to the ruins of old Panama, destroyed by the buccaneer Morgan, will be delightful.

Even Panama need not be shunned in the summer. The thermometer seldom reaches 90 degrees, and tho the rainy season is on (it lasts from May to January) it must not be imagined that it rains all the time. One or two hard showers daily is all that I have observed, each lasting perhaps a quarter or half an hour; two hours at the most.

On the west coast the steamers are comfortable, the rooms with door and window, each furnished with blinds; all cabins have electric lights, but few steamers afford private baths. The table varies on different ships, some novel Spanish-American dishes are served, but there is no trouble about getting plenty to eat quite good enough if not precisely what you have at home. If home cooking is what you want, it is better to stay there.

The thru steamers to Valparaiso call at various ports in Peru and Chile, but do not go to Ecuador. One desiring to visit that country may take an express steamer to Guayaquil, where yellow fever is more or less prevalent, and hastily crossing the river go by rail up to Quito, a pleasant city at an altitude of 9350 feet, almost under the equator, having on the way fine views of the noted mountains Chimborazo and Cotopaxi, first climbed by Reiss in 1872, world famed, but not so high as Aconcagua or Huascarán, and far less difficult than the latter. On a brief trip these must be omitted. Other scenes are more enticing.

The express steamers sailing from Panama to Valparaiso after several calls in Peru arrive in six or seven days at Callao, the port of Lima, eight miles distant, if favored by good weather. A charming city is Lima, of 150,000 inhabitants, where one will do well to tarry a week.

Yet here, as all along the route, tastes differ. Mr. Bryce, whose stay was utterly inadequate and in bad weather, thinks it is overrated, while Percy Martin, another Englishman and a caustic critic, declares that but three cities in South America are attractive as places of residence, and of them all he prefers Lima.

It is old-fashioned, reminiscent of colonial days, with narrow streets and houses mostly of one or two stories; but with electric cars, excellent shops, good hotels, the latest Paris fashions and people with graceful, courtly manners whom it is a pleasure to know. The Hotel Maury, called the finest on the west coast, has an exceptionally good table and comfortable rooms.

Among the most important objects for the sightseer are the cathedral and government palace on the Plaza de Armas, these founded by Pizarro, the cathedral, the finest in South America, containing the remains of the great conqueror. His invasion of a mighty empire with a force of 180 men is one of the most extraordinary exploits in the world's history. The Senate Chamber, formerly the seat of the Inquisition, the Exposition Palace, containing a most interesting collection of Peruvian antiquities and anthropological specimens, the oldest university

"THE HIGHEST RAILWAY IN THE WORLD"
This picture shows three windings of the railway which connects Lima and Oroya.

Copyright by Harper & Bros., 1906.

THE SNOWY HEAD OF MT. HUASCARAN

If favored by fair weather, a little beyond the port of Salaverry magnificent Mt. Huascarán appears above the frowning walls of the Black Range. The mountain rises 22,000 feet above tide-water, or 1500 feet higher than Mt. McKinley. The north peak was first ascended September 2, 1908, by the author of this article. The Black Range itself has a hight of eighteen thousand feet.

in all America, the second largest bull ring in the world, the race course and pavilion of the jockey club, the splendid markets, the zoological and the botanical gardens, the medical and other schools, various parks, boulevards and monuments, churches with fine paintings and carvings, the old house of the Marquis of Torre Tagle, with a famous collection of paintings, are some of the many objects in Lima worth visiting. The hill of San Christobal should be climbed, on foot or by aerial tram, to gain a view of the city and to see the remarkable wireless station from which messages are sent over the immense mountain range from 18 to 22,000 feet high to cities on the Amazon River, Iquitos and Manaos, the latter more than 1400 miles away.

Most important of all is the trip over the Oroya Railway, which no one of sound physique should miss. And a frail woman, be it observed, if with fairly good heart, is likely to endure the journey better than a stalwart man.

On this wonderful railroad, long known as the highest in the world, one ascends in seven hours to an altitude of 15,665 feet up the narrow Rimac Valley, among scenes of extraordinary grandeur; sixty tunnels, thirteen switchbacks, sixty-seven bridges and a 4 per cent grade making the climb possible on an ordinary standard gauge track. From Oroya (12,180 feet) it is possible to continue by rail to the famous Cerro de Pasco copper mines (14,300 feet) ninety miles to the north, or on horseback by a delightful three days' journey down to the tropical regions of the Amazon basin.

Sailing south from Callao one lands at Mollendo for Arequipa, Cuzco and La Paz. The desert, with its curious crescent-shaped sand dunes, is crossed before reaching Arequipa; a desert indeed, with no blade of grass, cactus or sage brush to relieve the ocean of sand. Arequipa has a charming location and climate on the lower slope of El Misti (19,200 feet) the city at an altitude of 7500 feet: a delightful oasis in the desert on a stream fed by the mountain snows. El Misti may even be ascended

on mule-back by those who like to climb as far as they can ride. Nowhere else in the world will such an opportunity be presented. A fine view will be had from the summit, both of crater and surrounding landscape, including the mountains—Chachani, a trifle higher, and Pichu Pichu, as much lower—on either hand, with many more in the distance. Down below, the Harvard Observatory deserves a visit, a splendid hospital and the Lucioni Gardens, besides the ordinary attractions.

Another climb by rail to 14,666 feet, nothing like so fine as on the Oroya road, is made on the way to Cuzco and La Paz. Cuzco, the old Inca capital, on a branch railway to the north, is a beautiful if melancholy place, full of sad memories, ancient, massive ruins of palaces and temples, with the wonderful fortress Sacsahuaman above the town; splendid churches of colonial days, and within a day or two's journey other remarkable ruins in the midst of delightful scenes.

The sail across Lake Titicaca, 12,500 feet above the sea, is a joy to be recalled forever. The blue waters, the islands, promontories and neighboring hills, with a long line of glorious mountains beyond in shining white raiment, form a picture indelibly engraved on the memory.

And La Paz! What a quaint and picturesque town, 12,000 feet above the sea, yet at the bottom of a valley 1000 feet deep! And in the distance one of those radiant mountains, Illimani, towers 9000 feet above. The steep and narrow streets, the Indians, the llamas, the market—no one should fail of at least two days in La Paz.

Then down to the sea and on to Valparaiso, deserts by the way, nitrate and others, to be examined if one has time, but not in a four months' trip. Valparaiso seems back in the everyday world,

A STREET NEAR THE MARKET OF LA PAZ

The name is a favorite one in Latin-American countries, but Miss Peck's La Paz is the capital of Bolivia, and is a city of some 60,000 population—two-thirds South American Indians and half-breeds.

busy and modern, with many English and Germans. The capital of Chile, Santiago, three hours away, twice the size of Lima, is, like Valparaiso, more European. Its unique Santa Lucia, a lovely terraced mountain park, its beautiful cemetery, wonderful in the time of the roses, its exquisite mountain views at sunset, added to its other attractions, make it a city of unusual charm.

The ride over or thru the Andes, for two miles in a tunnel, is a journey replete with interest. Splendid cliffs and other scenery are a continual source of enjoyment, which a glimpse of the great Aconcagua may by good fortune increase. Yet these mountains, if a trifle higher, are less magnificent than the best of Peru and Bolivia, which have vastly greater snow-fields, despite the fact of their being much nearer the equator.

Across the plains to Buenos Aires and now indeed in a new world: a second Paris it is called, which may be misleading. In location and plan they are utterly different. But a splendid city is Buenos Aires, with nearly a million and a half of people, in many respects surpassing New York; in its neatness, first of all, in its beautiful opera house, in its newspapers, in its race track and buildings, its delightful and numerous city parks, covering each a few squares, its great wholesale market, its well-lighted harbor, the third in that respect in the world, with New York far in the rear. A fine electric-car system serves the city, with no crowding, and already a subway —not there will they begin another ten years after it should be completed. One week, two, will not suffice to behold all the attractions, the many beautiful buildings, art galleries, etc.; a book is needed to recount them. Yet a single word more. The New York lady who thought she was going to set the fashions for those in Buenos Aires must have received a severe shock after her arrival. An afternoon stroll on Florida, a drive to Palermo Park, a visit to the race track or to the Opera may be a revelation to those who fancy that we lead the world.

A great contrast is afforded by a journey to Asunción, capital of Paraguay, and to the Iguassu Falls, in the midst of tropical beauty, higher than Niagara, and of surpassing splendor in the opinion of some who have seen both. Ten days or more would be required for a trip covering both the falls and the quiet old city of Asunción.

Montevideo, capital of Uruguay, splendidly situated at the mouth of the La Plata River, is a fine, modern, homelike city; with many other attractions, possessing beautiful parks, buildings and, in the suburbs, popular seaside resorts with the best of beaches and superb hotels. With one-fourth the population of Buenos Aires it should receive about that proportion of time.

Many lines of great steamships offer sailings to Santos and Rio, the former a three days' journey. From the greatest coffee port in the world one climbs on a remarkable cable road amid tropical verdure the picturesque Serra do Mar, a coast range of mountains, and continues to Sao Paulo, a most enterprising city of 400,000 people, which by no one should be ignored.

Last of all comes Rio de Janeiro, the most beautiful city and harbor in the world, to many the culminating joy of the whole delightful journey. The astonishing transformation of this city within the past decade almost equals the story of Aladdin's lamp. The splendid new Avenida, over a mile long, cut thru the heart of the city and all finished in twenty months, the magnificent parkway and boulevard, extending four miles along the front of the bay, toward evening thronged with automobiles, the fine substantial docks stretching two miles in the other direction, the beautiful drainage canal lined with superb palms, the delightful parks, handsome public, office and residential buildings, a splendid opera house, library and a hundred other things, I had almost left out the unique botanical garden, and the charming beaches; these are all below. It is the Sugar Loaf at the entrance of the harbor, the mountains enclosing the city and thrusting their arms down into it, which, together with the tropical vegetation, make the place a fairy land, and the view from the bay and from the summit of wonderful Corcovado, 2000 feet high, scenes of indescribable loveliness. Taormina, Athens, the Bay of

THE "AVENIDA CENTRALE" OF RIO DE JANEIRO

Brazil has in Rio, writes Miss Peck, "the most beautiful city and harbor in the world."

Naples are delightful, but Rio! go and stay a week if you love romantic beauty and you will not be disappointed.

Then a pleasant voyage of sixteen days and home.

The cost?

It is more expensive than an ordinary European trip. It is impossible to cut and economize as one may in Europe, tho there is a broad margin between the luxurious and the economical traveler. The round trip ticket, New York to New York, either across the Andes or around by the Straits, is $475. This includes meals and cabin on board ship, but nothing on land save transpor

tation from Valparaiso to Buenos Aires, no sleeping car or meals. The tourist agencies charge from $1300 to $1500 for a tour of three months or a little more. A really economical person might make a three months' trip for $800 or $900. The large party of the Boston Chamber of Commerce, which sailed April 25, expect $1200 to be the average expense of each person on a ninety day trip, which omits the Oroya Railway, Cuzco and, of course, Asunción and the Iguassu Falls, and makes the stay too short in all the chief cities. It is, indeed, better than nothing. It will cause some of the business men to open their eyes, and work more vigorously for South American trade, which amounted to over $2,000,000,000 last year. One may go alone and get along comfortably without speaking Spanish. French would be of some advantage, but English will serve. In the large cities there will be no trouble, in the smaller ones very little. Naturally even a slight knowledge of Spanish makes the trip more enjoyable. Join a party, if convenient, but have no fear of going alone! Only go and you will be happy!

New York City.

One Day

By William J. Long

["If you ask 'Why this text?' I answer: I have a way in the woods of spending long, long days alone," writes Mr. Long to the Editor. "And my friends ask, 'What can you find to *do* all the the time?' and 'Aren't you lonesome?' and many other questions. This article, which records only a small part of the experience of one day last summer, is the answer." Mr. Long is the author of *Ways of Wood Folk, School of the Woods, Northern Trails, Brier Patch Philosophy,* and other volumes.—EDITOR.]

During the night I had been up several times to watch Tookhees and his fellow woodmice playing in the moonlight. They have a way of amusing themselves by creeping up one slope of my tent and running down the other; and before they venture out to play you will hear them in different directions, signaling and answering each other by tapping on the ground. The woodmice ran away when Kook'skoos, "the mother of the moon," began a doleful calling to her owlets; and then, thru the light, dreamless sleep of the woodsman came the first chirping of awakened birds. The day had begun, and I came out to enjoy its uncovenanted mercies.

Killooleet, the white throated sparrow, was singing near his old nesting place, and tho his voice was a bit rusty, there was yet gladness in it. You will hear it said that birds sing only in nesting time, but the saying comes of late sleeping. When the first light comes with the gentleness of a caress, when life begins again with the inspiration of a new day, all the birds seem to feel the *sursum corda* and to be impelled to some joyous expression. Tho it was now late in the season, a score of warblers and thrushes were ringing their matins; a jay called; a fox barked; a kingfisher raised his "Jubilate"; and a word of Anne Bradstreet came into my head:

I heard the merry grasshopper then sing,
The black-clad cricket bear a second part;
They kept one tune and played on the same string,
Seeming to glory in their little art.
Shall creatures abject thus their voices raise,
And in their kind resound their Maker's praise,
Whilst I, as mute, can warble forth no higher lays?

Across the centuries I sent a greeting to this earliest of colonial singers, and to keep proper company with all glad creatures, I joined the chorus with "From all that dwell below the skies"—singing the old hymn softly, for two reasons: first, there were some sleepers in camp who regarded early rising as a form of mild lunacy; and second, if certain others woke up, they would surely ask where I was going and whether they might not go too. And I had chosen this day for a good lonesome, to go where I listed, and perchance to grow better acquainted with God and nature by meeting them alone and face to face.

As my canoe slipped away from the landing the mists hung low over the lake. Out of the mist came first a thrush

song; then a glow of soft color, like mother-of-pearl; and then the crown of a mighty pine, its top branches spread lightly over the sea of cloud like the wings of a floating raven. Doubling the island on which the pine stood sentinel, I used the sounding line to find the channel between shoals. And on the edge of the eastern shoal, as if indeed all things were foreordained, tiny ripples and splashes kept the water in commotion. "Under those uneasy smelts," I assured myself, "is the sockdolager I am looking for."

Close beside the shoaling smelts I lowered my killick, and turned overboard all such minnows in my pail as were in need of fresh water. Soon two delicately curving rods were out, one swinging its shining lure close to the bottom, the other holding a lively redfin just under where I had seen the water disturbed. Once more, after a year of toil, I was happily fishing, my companions the bird songs, the pearly mist and the awakening day.

He who counts time in such a place is no philosopher, and, therefore, no fisherman. I had waited an age, or a moment, living deeply the while, when the slender tip of a rod arched sharply "once, twice and again," and I was fast to something that seemed charged with electricity. He was netted after a heart-kindling struggle full of thrills, hopes, anxieties, and one awful, sinking moment when the line slacked and I could not feel his tugging. There he was at last, safe in the canoe, a firm-fleshed, deep-bodied, five-pound trout, with broad mottled back and spots of flaming crimson. I was admiring his beauty, his goodly size, and was humming the Doxology when the other rod rattled on the thwarts and its slender tip ducked out of sight under water. Another age of thrills, livelier but shorter than the last, and a big white fish—a rare catch here, and a delicious *bonne bouche*—is placed tenderly on his bed of moss, his blue and silver contrasting finely with the deep, rich colors of the trout. I draw a long breath and look around, for the fishing is over. There are more and larger treasures under those darting smelts; but sufficient unto the day is the blessing thereof. I shall come again. The pine, my only landmark, begins to hide his crown; the mist is rising, and glowing in the east with a golden promise. "I shall hide this catch in the Indian spring," I tell myself, "and begin another long day before the sun rises."

As I follow up the run to the spring, brushing the moist ferns and inhaling the fragrance of fir and hemlock, there is a movement ahead, a glimpse of an arched back, and a mink darts down the bank, wiggling his pointed nose as he smells the fish. Then I change my mind about my catch, for to leave it here is to lose it. Once I left two grilse and a salmon of fifteen pounds in a spring like this, and when I returned I found only mink tracks. But how the little creature could get away with such a fish without leaving a trail that I could follow is a mystery. I think he floated him off, as a beaver handles a log. Silently I make my way back, and hang the fish where the cook will see them when he comes to make breakfast ready. Then I slip away, leaving the camp still fast asleep. Their day has not yet begun; mine stretches away in both directions into endless vistas.

Again the canoe glides into the mist, which is swaying now in fantastic shapes, gloriously colored. To watch it is to remember Lanier's greatest poem; but

life is all a poem now, a poem at first hand, and no one has ever really written it. Across the lake we go, and up a stream where the great trees bend low over feeding deer that stand to watch our approach. From the stream we float into a smaller lake, profoundly still and mist shrouded, under its hills of spruce and pine.

It is beautiful here, and lonely enough to satisfy the most fastidious; but the Beyond is calling, and the spirit answers, "I come." Turning over the canoe, and tapping various pockets to be sure that I have a compass, matches and other things needful, I take to the trail with belt ax and fishing rod.

The way leads east toward the new day, first over an old lumber road, then northerly, I have heard, by a blazed trapper's trail; at the end of which, in a hollow of the hills, is a lake of wondrous beauty, over which hangs a tradition of good trout. I have never been here before, and the joy of Balboa and of all the explorers since time began is in the air.

The big woods are moist and fragrant with the breath of early morning. The birds are flocking, the jays calling and hiding things, the chipmunks filling their winter bins. Even the red squirrels are garnering with a dim thought of the lean days to come. There goes one now with a mouthful! I watch him awhile and learn a new thing.

Thru all dense forests the squirrels have regular tree paths, as well known to them as are paved streets to the city man. As I stop to drink from a brook and to listen to its music, Meeko comes back over the same course. His way leads thru thick branches (an unusual thing) and I examine his trail to find that he has tried to clear it by cutting off obstructing twigs. He has found a new food supply and made a *cache* somewhere near, and this particular tree-road is a private way; it is not for other squirrels. As he returns hurriedly with another mouthful he bumps into a branch, goes back, sniffs at the obstruction, and rushes away as if he had made up what he calls his mind. In a few minutes he comes back, not in his helter-skelter fashion, but following his trail in an exploring way. When he finds the fir branch that he bumped into he cuts it off. As it falls to the ground he watches it intently, his head over the limb, his eyes shining. He begins to snicker; then he discovers me watching him, and breaks out into violent scolding. I am wishing that I knew his language, which suggests an imprecatory psalm with a pirate's variations, as he follows me abusively along the road.

Off to the right, in a clearing that visualizes the abomination of desolation, is a deserted camp—a symbol of the wastefulness of the lumbermen who devastate these splendid forests. I hurry past, with relief when the ugly thing is out of sight and memory, and turn gladly with the trapper's winter trail.

Here, save for an occasional dim "spot" on a tree, for which guiding signal one must look ahead sharply, you find no trace of man and his works. All is still, fragrant, beautiful, just as nature left it. There is a sudden bumping of feet, and I catch the waving of white flags as a deer and her fawns jump away. A brood of partridges barely move aside into the underbrush, where they stop to watch me as I pass. A hare darts out from underfoot, and he too is inquisitive; he crouches in the first thick cover to find out who I am.

Up and down goes the trail, now over mighty hardwood ridges where the great maples stand wide apart, now thru dim evergreen valleys where one must feel his way; and at last comes a gleam of blue ahead. It is the lake, found at last, asleep amid the eternal hills! Over it bend the trees, as if they loved its clear water or their own reflections therein. On every point stands a giant pine, like the king-man of old, lifting head and shoulders above his fellows. From the water's edge the forest sweeps away grandly to the skyline. A moose and her ungainly calf are feeding on the farther shore. Some animal slips away unseen into the woods; a brood of wild ducks stretch their necks, alert and questioning, as I appear in the open.

It is a place to dream or watch all day. I rest at ease, for an age it seems, enjoying its quiet beauty to the full; enjoying also the rare blessing of silence. I have been awake and keenly alive since the birds called me, long ago; a thousand tongues, voices, messages have been

heard and understood; yet not a solitary word has been spoken; not once has the exquisite peace been broken. The *plash* yonder is hardly a sound, but rather a fragment of the great stillness. It reminds me, however, that the first question when I return to camp will surely be, "Are there any trout?" It seems a pity, almost a profanation, to disturb such a place by human noises; but I have promised to answer that question.

In a swampy spot between two hills I find some dry cedars, dead but still standing, and cut enough for a dozen logs and cross-pieces. One should be true Indian now, I suppose, and bind the raft together with bark; but to do that one must scar or kill a living tree—a thing which I never do if it can be avoided. So I use some spikes that I have brought in my pocket. As I push out on my homely craft, I know how the first man felt when he found himself afloat for the first time on his own invention. And it is a good feeling that makes a man understand his old ancestors.

The trout are surely here, but the sun has appeared over the hills and the day is bright. A few fingerlings rise as I cast here and there in the shadows of the rocks. They chivvy the feathered lure for a moment (for I will not strike them) and flash away unharmed into the depths. Suddenly, as the fly lights in a certain spot, there is a terrific rush and plunge. Aha! Tho I had intended merely to locate the trout, no fisherman ever trained himself so fine that he could withhold the electric snap of his wrist after a rise like that. The hook goes home solidly; the rod arches; the reel sets up a shrill yell of exultation as the line flies out.

I shall unhook him tenderly and let him go when I see how big he is. Yes, of course. But as he comes in, a splendid fish and fighting hard, something reminds me that man must eat, and that a trout can be well broiled on a split stick —a green fir stick preferred—to give him an added woodsy flavor. After killing him, as mercifully as such a thing can be done, I run a string thru his red gills and tie him to my loose-jointed craft. Then, just to see if there are any more like him, I break the hook, leaving only a harmless bit of steel on the fly, and wait for a cloud shadow before casting again in the same place. The rise that follows is such an one as a fisherman dreams of in his sleep.

There must surely be a spring here; for such vim and dash in trout at this season bespeak living water. The raft drifts over the spot and I stretch out to become as one of the logs, shading my eyes with my hands, which just touch the surface. There, to the left, is a great ring of white sand, and from the middle boils up a spring as big as my hat. As the raft grows quiet, shadows shoot in from all sides and rest on the rim of sand. Shades of Izaak Walton, just look at them! My trout weighs two pounds, but I wish now that I had let him alone and waited for a big one.

Carefully I take the ranges: big pine east and larch stub west; hawk's nest south and split rock north. Where the imaginary lines cross is the hidden spring and its treasures. No fear that I shall ever forget or fail to locate it, tho the waters spread wide and clear on every side!

The raft moves heavily shoreward and lands at the mouth of a little brook. I do not look at my watch; for to count time on such a day is to remember slavery. As I eat in thankfulness, after repeatedly dousing my little fire to kill all scent of smoke, the moose comes back with her calf; deer appear on the opposite shore, stepping daintily; the wild ducks glide out of their hiding; and I am one with the silent wilderness again.

Slowly, imperceptibly the lovely day slips away to join all the other days. Each moment of it is like a full hour of life, and each hour, when it is passed, like a fleeting moment. From an endless period of alternate watching and reverie I start up with the consciousness that the sun is below the western hills, that the shadows have grown very long, and that I have a dim trail to follow before I find familiar landmarks again.

As I hurry along, picking up the blazed "spots" with difficulty in the fading light and at times losing the trail, there comes now and then a tingling of the skin, like the touch of cold, when I pass thru darkening thickets where the night of life begins to stir and rustle. If the philosopher Hume had ever traveled

the wilderness alone after sundown, he would have found under his own skin some illustrative material for his central doctrine. He sought to explain what the mind of man is by telling its contents at any one instant (as if its continuity and identity were of no consequence); and there are moments on a darkening trail when the mind seems to be reduced to an acute point of attraction, at the tip of which, like an electric spark, is a sense impression. One becomes at such a time a veritable part of wild nature, and a thousand sights, sounds, smells, that ordinarily pass unnoticed, are each one bringing its message or its question. A man's dull ears grow keen; the pupils of his eyes expand like an animal's; his nose resumes its almost forgotten function of taking messages from the air; his very skin grows sensitive, as if it were a delicate receiving instrument; and a strange "sixth" sense, of danger or of unseen things, begins to stir in its long sleep. The flow of thought is almost suspended; the reason retreats to its hidden springs; and one becomes sensitive all over, alert and responsive in every fiber of his nature.

If this be the way the higher animals live (and I think it is) I heartily envy them their aliveness. It is alleged that they live a life of constant fear; but fear is largely mental and imaginative, and therefore beyond the animal's ordinary horizon. That which naturalists thoughtlessly call fear (probably because civilized man, without wild experience, is himself generally fearful in the dark woods) is in reality only exquisite sensitiveness to physical and perhaps pleasurable sensations.

It is almost dark when I reach the old lumber road, and the way lies open to the lake. Tho the day's journey has been long, there is as yet no suggestion of weariness and no relaxation of the splendidly awakened senses. There, just ahead, is an open spot where all trees and underbrush have been cut away. A hundred small roots and stumps cover the place, looking all alike in deep shadow; yet somehow I am aware (without knowing why or how) that one is different from all the rest. I fix my attention upon it and approach quietly, nearer and nearer. My eyes say that it is only a stump, dark and silent; there is absolutely no motion, and nothing in the form to suggest what the creature is. There it huddles in the dusk, but it is alive and not dead. I bend forward to touch it—*Burrrrrr!* With a roar of whirring wings a cock partridge bursts away like a bomb, giving me a terrible start; for he was the last thing I expected.

As I cross the lake campward, the evening star is sparkling like a great jewel on the pointed tip of a spruce that towers above his fellows on the crown of the western hills. Overhead passes a sound of hurrying wings; a loon calls far away; and again these wild sounds are as fragments of the great stillness. Under the gliding canoe the waters are quiet, as if in deep slumber; but at a distance you can hear them talking to the shore, with a voice that is now a whisper and now a faint echo of music. On every side the dark woods come close to mingle with their own reflections; and they seem to be listening, to be waiting. Over all this silent, expectant world some mighty presence, living but unseen, seems brooding on the mystery of life.

I also begin to brood. For the first time in uncounted hours there comes a touch of relaxation, a quieting of the alert senses, the "well done" of a perfect day. I quote softly from Lanier:

> And now from the Vast of the Lord will
> the waters of sleep
> Roll in on the souls of men;
> But who will reveal to our waking ken
> The forms that swim and the shapes that
> creep
> Under the waters of sleep?

As I double the last point a light flashes cheerily out of the dark woods, where a voice calls "Welcome home!" As I turn for a last look at the sleeping lake, the last glimmer of twilight fades and vanishes over the western steeps. Goodbye, my Day—and hail! You go, yet you stay forever. You have taught me something of the nature of eternity, of the day of the Lord that is as a thousand years and of the thousand years that are as one day.

Stamford, Conn.

A Look at Cornish

The President Picks an Artist Colony for the Summer Capital

By Philip Littell

[The New Hampshire town which is the subject of this article has long been known to painters and writers, for here it was that Saint-Gaudens, the sculptor, turned a barn into a country house and drew around him a community of kindred spirits. Maxfield Parrish, the artist, Herbert Croly, author of the *New Nationalism*, Norman Hapgood, the new editor of *Harper's Weekly*, and Winston Churchill, the novelist, are only a few of those who have lived there.—EDITOR.]

Altho I have forgotten the name of the man who first lied to me about Cornish, I can still recall the features of his lie.

"Going to Cornish?" he exclaimed, with pity in his voice. "Do you realize what you're up against? The Cornish air is dense with art. It will stifle you. I had a friend who spent a summer there. Not a soul called on him, poor fellow. No, not because he wasn't an artist, but because he had painted his barn a bad color. Another friend of mine, a girl, fared no better. Her first callers, a couple of women, fainted when they saw the ornaments in her sitting room. Nobody else came near her. On the roads you meet nothing but Blessed Damozels and men who look like esthetes. There is a shrine at every four corners, with a Botticellesque figure inside. When the inhabitants aren't worshipping at one of these they worship each other or themselves. Don't go there, old man. You can't talk art."

When I arrived where I could contrast the real Cornish with the calumny, most of the liar's lines had been rubbed out, but perhaps a blurred something was left in my mind. And Cornish was a surprise, so colored was it and so young; not a community to be criticized, but a thing to see.

We spectators were seated in a field, late on a June afternoon, a few rods away from a small ravine. We looked across the open space, thru a border of pines left standing on the level ground, into the pine wood with which the ravine was filled. Before us, in the center of our picture, just where the dark trees began, a white altar waited in the slant light. It did not wait long. Up from the ravine, where they had lain hid, a few at a time all Cornish came to take their places near the altar—gods and goddesses, dryads I think there were, or nymphs, fauns and rustics, dressed in colors of splendor, in colors glowing like the quieter gems, in colors that added up right. This we saw during a short play, an agreeable play, filled with references domestic and successful, not meant for export. Then a golden bowl was given to Saint-Gaudens, in honor of whose coming to Cornish, twenty years ago then, the occasion had been designed, and the pageant, professional in its competence, was over. Principals and supernumeraries, children and strangely youthful parents, flowed in a colored stream up the June field to Saint-Gaudens's older studio, where supping at long slim tables, set in the deep porch, they were a wonder still to look at, but in speech as unselfconscious and noisy as the rest of us, when we are having a good time.

The first time I dined out in Cornish, knowing I cared for pictures or reliefs only as a man ignorant of flowers and trees and stone may care for the country, I wondered whether this inadequacy would protrude. There was no need to worry. At that dinner not a word was said about art. Seated out of doors, only the women in evening dress, with a valley dreaming itself away to the south—a Wordsworth-sonnet view, someone called it—all talked cheerfully of their own concerns, of their neighbors, whose sheep had been killed, whose dog was under a cloud, who had been buying land, at whose court they should meet the next day for tennis.

As I drove home down the valley, thinking with what courtesy and mercy art had been avoided, gratitude was tempered by a doubt whether I had often heard so many unknown Christian names. A Wordsworth-sonnet view it had been called and I could see why, remem-

HARLAKENDEN HOUSE, CORNISH, N. H., WHERE PRESIDENT WILSON WILL LIVE

bering at the same moment, with less delight, certain other sonnets of Wordsworth, entitled "Personal Talk." Yet the feeling which even then prevailed—that I had never been among men and women freer from pose, more unspotted by celebrity—is the feeling that has lasted.

Their attitude toward a newcomer—and in trying to sketch the attitude of a whole community one falls inevitably into caricature—is partly determined by their training. If he be rich or smart, he is politely inspected. If he happens to be anything else, if he happens to please his inspectors, politeness gives way to cordiality. If he tries to live at Cornish the life of the smart world, he is laughed at. But one who has the luck not to be blackballed will find Cornish "well adapted," as Mr. Karl Baedeker says, "for a prolonged stay," and in many traits unusual. The proportion of men is high, for a country place so far from town, everybody is at work in the morning and the early afternoon, nobody drops in on anybody else before luncheon or after dinner, there is no stock market talk, the establishment of a country club is inveterately opposed, the professional conversationalist is unknown, the number of sterling bores can be counted on your missing fingers.

It was a happy accident that brought Saint-Gaudens to Cornish on a visit. Altho he had not exhausted the Connecticut Valley he knew that Cornish was the place to live with. The same knowledge came inevitably to the men and women who went to Cornish because he was there, and stayed near him because he was in Cornish. Their love of Cornish is a passion. They do not maintain theirs to be a better landscape than can be made out of trees and pasture and shapes of hills. Innumerable other spots in New England are gifted with the same intimate little sceneries, made of the same materials, of white pines growing near oak and maple, of brooks falling over boulders, of ledgy fields.

Yet here the people are certain that Nature was fortunate. A little journey or a long, up or down the valley, is enough, they say, to persuade any one with eyes that here, just here, for the length of a few miles, there is a difference. From all the happier sites in Cornish the space in view, a space enclosed by the hills of Vermont on one hand, the Cornish hills on the other, and southward not quite closed to the mind by Ascutney Mountain, contains neither too much of the stuff of landscape nor too little. The contents of this space are not huddled, nor does any lesser hill stand in another's way. So right is the proportion of field to woodland that you would think an artist had told the cutters where to labor and when to stop. Place yourself on any of these happier sites and the valley lines lead your eyes to Ascutney, where they would be, and are at rest.

Yes, the same good space, its lovers tell you, all the year—thru the sustained snow sparkle and the traveling shadows of a winter day, when the birches are first tipped with life, blue and tremulous under August heat, splendid when October leaves, about to die, salute you. And even later, in November, one may find a pleasure in green of the pines, grey skies and browns of some withered garden.

ALL ABOARD FOR VACATIONVILLE!

Sketches made for THE INDEPENDENT in the new Pennsylvania Railroad Terminal

THE NEW BOOKS

California

Since the days when the golden fleece of her placer mines began to lure to California's shores the Argonauts of the world, that state has seldom been out of the limelight of publicity. The Japanese imbroglio over the anti-alien land bill, a hotly contested campaign to save a portion of California's wild life from market hunters and game hogs, and methods of exploiting the coming Panama Exposition, are but the latest maneuverings of a more than Gallic genius for excitement. Any reader of Zoeth Skinner Eldredge's book, *Beginnings of San Francisco,*[1] must be struck with the remarkable manner in which California's past history of romance and adventure explains many aspects of the present political temper of her citizens.

The title does not accurately describe the scope of this admirable historical study. While interest finally converges somewhat exclusively upon San Francisco, this two-volume work is really a history of California from the expedition of Portola in 1769 to the granting of San Francisco's charter in 1850. Mr. Eldredge has gone to the original sources and succeeds in throwing new light upon many moot points of Pacific Coast history. He finds, for instance, that Anza's famous expedition from Sonora to California in 1774 crossed the Sierra Madre by a pass which cannot be identified with the San Gorgonio. In this he takes issue with Bancroft.

The adventures of these hardy Spanish explorers, always accompanied by the padres, afford interesting reading. In their diaries one gets glimpses of Indian tribes and pueblos that have vanished forever; of an incredible wealth of wild game; of perilous river crossings; conflicts with Indians, and the beginnings of colonization. The depressing effect which the California missions later exerted upon the agricultural and industrial development of the coastal region is clearly set forth. He shows that the secularization of these missions was no injustice to the Roman Catholic Church, but had been provided for in the articles of colonization, and proved a great benefit to California. There is constant reference to documentary sources, and a full apparatus of notes. The twenties and thirties of the past century constitute what the author calls California's Golden Age. It was the era of ranchero princes, the children and grandchildren of the first Spanish colonists. Families were large, and the Arcadian simplicity of their country life bred fine physical types. All authorities agree in lauding the superb beauty and charm of the Spanish-Californian women, whom R. H. Dana, Jr., immortalized in *Two Years Before the Mast.*

In due time came the foreigners, mostly Americans, and the so called Bear Flag War. In tearing the hero's mask from the faces of many of these early immigrants into California the author has done a real service. In point of culture they were mostly far inferior to the Spanish Californians. But as soon as the newcomers thought themselves strong enough they began to commit all sorts of outrages against the natives, both Spanish and Indian.

One of the make-believe heroes was John C. Fremont, after whom so many streets, schools and towns have been named, and who at one time was credited with "finding" almost everything west of the Rocky Mountains. As early as 1886 Prof. Josiah Royce called attention to serious discrepancies in his account of the part he claimed to have played in securing California for the United States. From Mr. Eldredge's careful array of facts General Fremont emerges

[1] *The Beginnings of San Francisco.* By Zoeth Skinner Eldredge. San Francisco: Published by the author. Two volumes.

as a rather petty and unscrupulous adventurer, with not the least title to remembrance as the hero of California. Upon some of his acts the reader will pass a much harsher judgment.

A book of a somewhat different kind is Helen Throop Purdy's *San Francisco, As It Was, As It Is, and How to See It.*[2] The author's primary purpose has been to provide a kind of manual of historical information. The facts have been collated with care and discrimination. One may remark in passing that the chapter on Clubs omits the Sierra Club, a unique organization. Taken as a whole, the author succeeds admirably in setting forth "the most prominent of the city's characteristics." The artistic printing and hundreds of beautiful half tones add much to the attractiveness of the volume, and the great disaster which overtook the city by the Golden Gate in 1906 still is recent enough to arouse general interest in a more portly volume, *San Francisco Relief Survey,*[3] embodying six studies, by as many experts, on the relief methods used after the earthquake. So efficient and practical were the methods of organization at San Francisco that advance copies of some of these chapters were rushed thru the presses by the Russell Sage Foundation and put in the hands of the Red Cross representatives at Omaha, Dayton and Columbus.

But there is a world of interest outside of California's metropolis; a world of varied natural charm that constantly brings new writers under its spell. There was Bradford Torrey, who served his apprenticeship as a bird student and nature lover in the East. His regularly appearing books gained for him a steadily enlarging circle of readers. For three years he had been resident at beautiful Santa Barbara. There he died last autumn before he had seen even the proof of the last of his books, *Field Days in California.*[4] In the delightful opening chapter on "A California Beach" he offers his apology for having fled the more rigorous chastisements of a New England climate. "The implacable years," he writes, "are having their way with me; the almond tree begins to flourish. . . . It is time to be comfortable, something tells me; and so, as bad boys were said sometimes to do in other days, I have run away from school." It seems appropriate that he should have been the editor of Thoreau's *Journal.* No one of our day had more of the latter's unaffected intimacy of observation and simplicity of statement. This book exhibits him at his best. It is full of fascinating ornithological incidents told with scientific truthfulness and great charm of expression. The publishers have sought to give the volume something of a memorial character by providing a portrait of the author and illustrations of localities described by him.

Another book crammed full of outdoor interest is J. Smeaton Chase's *California Coast Trails.*[5] The author is an Englishman who has resided in California for some time. Accompanied on the first lap of his cruise by an artist companion, Mr. Chase made a nearly continuous trip on horseback from Mexico to the Oregon boundary. He followed the coast, carrying his simple camping outfit on the animal he was riding. According to his own testimony, "the facts and beauties in nature and the humane and historic elements in life" were the "points of special attraction" on this pilgrimage. One must adjudge him to have been notably successful in his attempt to portray these elements of California life, for he has produced a very readable volume. Sketches of the old missions, occasional humble survivals of Spanish-Californian life in out of the way places, and glimpses of sleepy villages far from the railroads, are mingled with exhilarating descriptions of ever changing scenery. Incidents both comic and serious enliven the narrative, and one is glad, finally, that the author was not swallowed up in the quicksand from which he had such a narrow escape.

Mr. Sheldon's recital of hunting experiences in *The Wilderness of the North Pacific Coast Islands*[6] may be assigned a

[2] *San Francisco.* By Helen Throop Purdy. San Francisco: Paul Elder & Co.

[3] *San Francisco Relief Survey.* Compiled from studies by six social workers. New York: Survey Associates, for the Russell Sage Foundation. $3.50.

[4] *Field-Days in California.* By Bradford Torrey. Boston: Houghton Mifflin Co. $1.50.

place in this group, altho it escapes from the geographical limits of our title. There is much in this book which a prospective visitor to the islands known as Vancouver, Montague, Queen Charlotte and Admiralty would find interesting. Mr. Sheldon has to his credit the discovery of a new species of bear from Montague Island, which has been named after him. We may rightly assume that his hunting has been done chiefly in the interest of science. We venture to think, however, that some readers will feel a little out of patience with his description of how he crawled up to a she-bear nursing her cub, and then pumped both of them full of lead. In the same class belongs the killing of a fawn and doe by Mrs. Sheldon. If the necessities of science and sustenance are to be invoked as an excuse, there might properly be less circumstantiality in telling about such killing. Fortunately there is much else in the book which is not of this kind. His observations and experiences among the wild animals of these northern islands will be read with deep interest.

New Leaf Mills

Owen Powell was a come-outer in various ways. He condemned the Mexican War and the Fugitive Slave bill, had a hell of his own make and choice, with no personal devil in it, no particular torments, except of the negative sort. His wife, in the absence of certain practical gifts on the part of her husband, had, all her married days, worked hard with head and hand "to get together and keep together a few things which dignified her simple house in town. There were notably six cane-seated chairs which had been given her for the distinction of her parlor, and which she now hid in her own room rather than set them out in the place where those hulking farmers would despoil them; she would indulge some of the neighbors' wives with the use of them when these worthier women came alone; she would show them her pieces of old silver, and in moments of signal intimacy bring out her black silk and her best bonnet, which could not otherwise be seen, for the Powells did not go to the service of any sect of the old church in the village where the country women wore their finery. She had their air-tight parlor stove put up in her bedroom, with the bookcase which held her husband's library, and his portrait done in his young manhood, and the mahogany-framed engraving of Swedenborg which visibly attested Owen's religious persuasion and hers."

From this bit of description it may be inferred that Mr. Howells, in his new novel*, has reverted to his old treatment of American country life. The story, which he calls a "chronicle," takes us into the Middle West for scenery and general condition, but the action, the manners, the atmosphere, are almost equally characteristic of New England, New Jersey and Ohio, altho it was in the last-named state that the author passed his boyhood. Calvinism, Scotch Presbyterianism and the new German mysticism were all in the pot at that time, sixty years ago—all redolent of fresh distillations, or, to change the figure, all were engaged with the incubator, testing many callow hatchings. "Keen," as the new slang has it, on facts as he finds them, and unwilling, as was the poet Wordsworth, to let any fact go, however commonplace it may seem to others, he, like Wordsworth, brings realism to its hight and depth and, like the English bard, takes the risk of seeing his readers take their choice among his books, sure of one thing, that the author is in earnest, determined to be effectively helpful in making the new world more worth living in. His types of character are of the Scotch-German-Puritan strain—the ineffective dreamer of dreams, bending over the incubators; the tender-hearted, overworked and overworried wife, who energizes while she despairs, loves her husband for himself, but is doubtful as to the hatchings from their incubator; the sodden, floury-faced mill-worker, Overdale, "surly, solitary and of a rude force of will and savage temper, such as none of the farmers who stored their wheat with him in the deep bins of the mill would have cared to trifle with." A man who hugs the "burrs" and the "jug" with equal affection, as he slips moodily into the downward whirl

*_New Leaf Mills: A Chronicle._ By William Dean Howells. New York: Harper & Bros. $1.50.

that pulls away from sanity. These are the main elements of a tragedy such as Mr. Howells in his later work most affects. He has lost none of his skill in handling tragedy to effective ends, and in the by-products of his main theme he is as creative as ever. The pretty maid, Rosy, is a special creation in an old familiar line of sad heart history, while the chief villain, Captain Bickler, is a varation of a type which Mr. Howells has made his own in Bartley Hubbard—"a spare, graceful figure in a black broadcloth coat and black cassimere pantaloons, covered to the knees with green baize leggins. He wore a silk velvet waistcoat, with a gold watch chain crossing it; the peak of a flat, oilcloth cap came over his forehead to his shifty hazel eyes; his dark hair fell from the sides in locks carefully turned in at the ends. His clothes were of a cut that the neighbors understood to be fashionable." Such is the outward picture. A bit of dialog between him and the jug-loving miller is in Mr. Howells's best style: The miller is at the front door on the second story of the mill, smoking his pipe; the lawyer on horseback in the road below:

"Hello, Overdale. Have you heard the news?" . . . The miller paused long enough before answering to spit to the leeward of the horseman. "What news?" he grunted, with his pipe between his teeth.

"About the mills. You're sold out of house and home."

"I know it," the miller answered, but so quietly that Captain Bickler must have felt at a loss how to go on. He said, with his eyes fixed in uneasy inquiry on the miller's white mask, "They're to put in paper machinery, I hear, in about a year from now."

The pipe fell from the miller's teeth and broke at the bay mare's feet.

"Well, what of that?" he demanded.

"Nothing. But I think it's a damn shame."

"Yes. Is it any of your damn business?"

The lawyer took the retort as a joke and forced a laugh. "Well, I just wanted you to know how we feel about it 'round here."

"Well, now I know."

. . . "Well, you know where to come if you want any law; that's all. It won't cost you anything."

The picture is perfect; the character of the two men and the situation show all the qualities of good dramatic work.

The working out of the story of the *New Leaf Mills*—the freshness, the deep, tragic interest of it—we leave to the reader, assuring him that nothing in the later school of novelists is cleaner, more just to the conditions of the times, and fuller of interest to those who seek a lesson in the tendency of our home life of today.

Some Travel Books

Edward Hutton's *Highways and Byways in Somerset*, with illustrations by Nelly Erichsen (Macmillan, $2), is a worthy addition to the Highways and Byways series, which is making known the nooks and crannies of England. Until the automobile revolutionized summer travel few Americans saw anything of the county of Somerset, except the city of Bath. If they did push their investigations a little further, it was merely to Wells, Glastonbury, and perhaps Bridgewater. Railway connections for other parts of the county were difficult to make, and the journeys by train were not agreeable. Now, with an automobile at one's service, no part of England better repays a leisurely visit. Nowhere does history reach further back into Roman civilization; nowhere is the succession of nationalities, manners and religions that have dominated England more continuous or better recorded, and nowhere in the length and breadth of the country is there more truly typical English scenery. In fact, Mr. Hutton does not exaggerate when he speaks of the view from Beacon Hill as one of the most astonishing in England. To come out suddenly on the crest of the hill toward evening, and to see stretching out beneath the vast blue-gray plain, bounded in the far distance by the hills of Devon and Dorset, and bearing in its bosom, villages, towns and cities, with here and there the spires of distant churches and cathedrals—this is an experience that is worth the journey to Western England.

Another helpful book for the tourist who is planning to cross the Atlantic is Black's new edition of the *Guide to Ireland* (Macmillan, $1.75). There is no need to insist upon the excellence of this volume. The fact that it is in its twenty-fifth edition tells its own story. Several additions have been made to the book which will increase its usefulness to tourists in a practical manner. Some new maps have been inserted, and the information about distances by rail and road, about summer cars and steamers, hotels and stopping places is of much value.

More romantic than a guide book is Miss Fox's *Annals of the Irish Harpers* (Dutton, $2.50). This little book supplies not exact information about the country, but something of the Irish atmosphere and some

understanding of the artistic nature of the Irish people. Miss Fox's purpose has been to rescue from oblivion some of the famous old performers on the national musical instrument, which, tho it is still depicted on the Irish flag, has gone almost out of use among the people. The period covered by the book is the last quarter of the eighteenth century and the first forty years of the nineteenth. But, tho "the last of the harpers" died in 1843, Irish minstrelsy is coming to life again in the hearts of the people under the fostering care of the leaders of the Gaelic movement. With the removal from the land of the terrible curse of destitution and famine, Ireland is becoming again a nation with ambitions, aspirations and ideals, and the traveler to the Green Island needs something more than a mere guide book if he is to see and recognize the stirrings of this new life of the Irish people.

A YOUNG BEAVER AT HOME
From Enos A. Mills' "In Beaver World" (Houghton).

Beavers and Birds

Here are two books greatly unlike yet united by the common quality of out-door attention to animal ways and means. Neither is much to be commended from the literary point of view, for the beaver book (*In Beaver World,* by Enos A. Mills, Houghton Mifflin Co., $1.75) is ill arranged and somewhat prosy, and the other (*Out With the Birds,* by Hamilton M. Laing, Outing Publishing Co., $1.50) is sketchy and too colloquial in style to please the fastidious; yet both are entertaining, profitable and copiously illustrated from photographs taken by the authors.

Mr. Mills's book is remarkable for originality of material. He has spent most of his life where beavers dwell, and those who know the animal best will most appreciate the important and trustworthy additions he has made to our knowledge of it and its work. Probably no one has ever had or, at any rate, has availed himself of, such opportunities to learn beaver habits and the reasonableness of them as this writer; and he has utilized them in a highly scientific way, and given us a book of far more serious value than it at first appears to be. Everybody who cares for animals should read it.

Mr. Laing aspires to no such special instruction. He is a bird-lover and sportsman who prefers the kodak to a gun, and tramps the prairies of Manitoba, or paddles upon its lakes, content with a successful "exposure" or a novel experience in his notebook

as game enough for the day. This is a new field to most readers, and they will enjoy the breezy stories of bird-life and photographing adventures all the more for the novelties of name and habits with which the pages are picturesquely filled. The book is, in truth, a very welcome addition to the naturalist's library, and the illustrations are so good in subject that it is a pity many of them are badly reproduced. The lack of an index is noticeable, especially in contrast with the capital index in the beaver book.

American Nobility

A young American heiress, who has been inclined to consider marriage between American women and foreign noblemen an abject failure, goes to Paris on her first visit. An impecunious count of high social standing, to whom the idea of marrying for money has been always repugnant, is prevailed on by his friends to pay his court to her. They love, are married, and the depleted coffers of the French family are filled from the American woman's fortune.

So far, so good. The rest of the story is less good. Frankly, it bores us, and the author's popularity in certain circles in France, even the American vogue of her account of England—*The Unknown Isle*—avails her nothing. While ostensibly the new book is a novel, it seems at bottom a warning against marriage in general and specifically against the marriage of good French people to the terrible American heiress. The plot is banal; the treatment weak and tiresome; the characters colorless; the "psychology" more pretentious than profound. We see no good reason for the translation of such a work from the French; there are already plenty of bad American novels—and aren't there plenty of good French ones?

The Flirt

To a story of a beautiful but "spoiled" American girl, a melodramatic, polished villain, a precocious, unlicked cub of a small brother, add the other approved ingredients of popular romance and you have Booth Tarkington's *The Flirt* (Doubleday, $1.25). The story opens most promisingly, but after visibly weakening, dies of inanition. Mr. Tarkington describes the social life of an Indiana town with actual brilliancy. One sees with vividness the wide, shady residence street with an occasional cast-iron stag upon a lawn, and feels that he is associating with the people in this little drama, so well are they portrayed. So we regret his failure to keep his breath and write a novel as good thruout and as interesting to himself as *The Gentleman From Indiana.*

Roast Beef Medium

Emma McChesney travels for a firm of petticoat makers and knows life with an exceeding knowingness. Her knowledge of fellow drummers, buyers, hotel clerks and would-be admirers, and her vocabulary of slang, are wonderful. For ten years she is "on the road," and conserves her health by avoiding rich hotel dishes and sticking to *Roast Beef Medium.* Her adventures are always amusing, and the reader grows to admire her sane and practical philosophy. These stories of Edna Ferber's link themselves logically together and make most diverting and wholesome reading. (Stokes.)

Hunting Extinct Game

Prof. Frederic Brewster Loomis, of Amherst, had for seven summers conducted expeditions in search of the remains of extinct animals, particularly in the Wyoming beds. These expeditions had been financed by members of his own college class of '96 and others. These friends, having made possible a journey to Patagonia. Professor Loomis reports upon *Hunting Extinct Animals in the Patagonian Pampas* (Dodd).

On this, his eighth annual expedition, the scientist took with him an Amherst College senior and a junior, and a man to care for the horses, as many as could be accommodated in a single tent. Something was known of extraordinary animal bones found in Patagonia and it was a question of much geological importance to add to the list and to learn from what region South America gained its fauna, whether autochthonous or derived from North America or from Africa, as the leading authorities had asserted. It is also very desirable to learn at what geological periods the successive elevations and depressions of the continent have occurred. This volume is preliminary, gives a running account of the journey and its experiences, and in a familiar way the results and conclusions reached, and is to be followed by a scientific report of the multitude of animals, birds and shells whose remains were found.

The first searches were very discouraging, but at last a pocket of bones was found which abundantly occupied their time. Of these the most important is a full skeleton of the Pyrotherium, an animal of which previously only a few teeth had been gathered, and which had been supposed to be an elephant, allied to that of Africa. This monstrous animal, with four tusks, Profes-

sor Loomis finds not to be related to the elephant; and so, here and elsewhere, the African connection fails. Equally a monstrous bird as big as the New Zealand moa belongs to a different family. The conclusion arrived at is, that the fauna had its source during the Cretaceous period from North America, but by a sinking of the land the two continents were separated until a subsequent elevation in the Pliocene period connected them by the Isthmus of Panama. There was a long period of separation, in which the South American fauna developed their own pecularities. The beds in which Professor Loomis worked probably belonged to the Eocene.

While the description of the experiences of travel are interesting, there is nothing of an exciting nature, no fights with Indians or hunting of savage beasts; nothing worse than the losing of horses and the accidents of the day. The expedition was successful and its patrons have every reason to be satisfied. It pays better returns to a college than a baseball or even a musical vacation tour.

Books About Brittany

"Altho remote in civilization," writes Mr. Robert Medill, "Brittany is readily accessible." It is thus that he opens the second chapter of his *Little Book of Brittany* (McBride, Nast, 75 cents), which, tho of pocket size and of less than one hundred pages, does all the same contain a good many hints for travelers and pictures of the more accessible points of interest. We are glad to see St. Malo given its proper place as a town of uncommon historic interest and picturesqueness, for Karl Baedeker is most unjust to this seaport. For those vacationers still in doubt as to the best French province to tour this year—afoot or in limousine—this book is likely to prove an alluring invitation, for the writer's unpretentious style is altogether agreeable and his illustrations numerous, pleasing and representative. If a new edition is called for the fact should be noted that Chateaubriand, tho born at Combourg, lived there only during his boyhood, and the statement that the present occupants of the château "are his direct descendants" should be deleted, since even the most conscientious biographical muckrakers have failed to discover any offspring of "the charmer." These errors, and a few misprints, are the only defects of an uncommonly pleasant account of happy journeyings.

The reader who would know more of Brittany's charm and mystery than Mr. Medill has time to tell may profitably turn to Mrs. Gostling's travel book, published several years ago; better yet to the volumes of Anatole le Braz, several of them accessible in English translation. We are glad to note that M. Le Braz has brought out, thru the publishing house of the late Honoré Champion, of Paris, a new edition (containing fresh material) of his study *La Légende de la Mort*. And another Parisian publisher—M. Jouve—issues in one volume the Breton verses of M. Charles le Goffic. Brittany is almost as popular as her Celtic sister, Ireland, in contemporary letters!

Literary Notes

Kate F. Kimball in the compact illustrated volume *An English Cathedral Journal* supplies more briefly and with fewer architectural details than Mrs. Van Rensselaer information about many churches dear to the American tourist. (Crowell, $1.50.)

A sportsman's notes on *Trails and Tramps in Alaska and Newfoundland* ought to be fully illustrated from clear photographs, and that is the case with William S. Thomas's (Putnam; pp. xv, 330). It is an entertaining volume about little-traveled regions.

A garden lover has written a flower-garden romance in *A Midsummer Wooing*. The author is Mary E. Stone Bassett and the illustrator John Goss (Lothrop, Lee & Shepard Co., $1.25). The spirit of *A Midsummer Wooing* is one of love for people as well as for roses—and even a love for all kinds of people.

A new edition of Dr. W. T. Grenfell's *Labrador, the Country and the People*, that is in effect a bringing together of chapters on the history, physiography, geology, scenery, natives and animal and vegetable life of the province by a number of writers, is issued by Macmillan ($2.50). New Material and many illustrations are added.

Edward Hutton is at home in writing his study of *Ravenna*, and Harold Sund in his illustrations is far more successful than the average illustrator of travel books. Some of these illustrations are in color and most handsomely reproduced; others are in line, and the book is imported by Dutton ($3). History and architecture furnish the English writer with an amplitude of material.

France is as much the pleasure ground as ever, whatever her crises of birthrate and international relations and anti-militarism may be, and Arthur Stanley Riggs, F. R. G. S., has in *France from Sea to Sea* produced an attractive book containing many hints of profitable journeyings. The introductory chapter offers practical sug-

gestions. A fine book for the traveler by automobile, and illustrated from many photographs (McBride, $1.25).

Lovers of our American humorist will be interested in *Mark Twain and the Happy Island,* by Elizabeth Wallace (McClurg, $1.00). It is a simple account of days in Bermuda—reminiscent of delightful hours of comradeship with him and full of appreciation of his humor and his understanding love of children. The glimpses of the quaint charm of the "Happy Island," with its fragrance of blossom, its wonder of color, make the reader understand Mark Twain's writing from there, "You go to heaven if you want to—I'd druther stay here."

MARK TWAIN IN BERMUDA
From *Mark Twain and the Happy Island* (McClurg).

It is disappointing, after catching just a glimpse of a wonder-spot in the first few pages of J. Law Redman's *Isles of Summer Seas* (G. W. Dillingham Co., $1.50), to lose it in the description of the uninteresting and commonplace tourists whom the author and his companion chanced to meet. The charming little sketches scattered thruout the book encourage one to follow the travelers thru a rather wearying round of conventional sightseeing—in the hope that the promise of the first few pages may be fulfilled and another delightful word-picture lie just over the page. While the tourist seeks for the charm of Bermuda in the guide-book routes, the spell of that "Island of Enchantment" slips by unseen.

An elaborate reprint of the Rev. Lal Behari Day's *Folk Tales of Bengal* is issued by the Macmillan Company with illustrations in color by Warwick Gobel. This makes an octavo volume of 275 pages and is an admirable telling of wonder stories current among the Bengalese people, and an important contribution to the world's folklore. The stories here resemble in some ways those of the *Arabian Nights,* but are free from impurity and lend themselves admirably to Mr. Gobel's illustration, which is spirited, and effective in color.

Doctors, love, mal-practice, politics run over each other in the mad rush for the climax of *The Career of Doctor Weaver,* by Mrs. Henry Backus. There are plenty of medical terms, lots of intrigue and references to Hippocrates' oath, and the Drs. Weaver (there are two of them) marry the women of their hearts. All ends well. The book is dedicated "to him who has seen the vision and dreamed the dream." It is published by L. C. Page & Co. ($1.25).

English garden books are not good guides for American gardening, but are generally most suggestive and pleasant reading, and *The Guide of the Garden Lovers* is not only interesting and pleasant reading, but the chapter on "Delicate Gardens" is equally good for England and America. We do object to the slight slur against harmony of color in a garden. When now there are school-books on the laws of color, and the laws are as fixt as the laws of gravitation, and a garden is for color as well as for scent and sentiment, it seems a little lack of intelligence to speak slightingly of harmony of color in a garden. (E. P. Dutton.)

In *School and Home Gardens* (Ginn & Co., 80 cents) W. H. D. Meier begins with window plants for the schoolroom, but soon passes on to house-plants and both flowers and vegetables and their shrubs and trees for the garden. It is not botanical but cultural—a multitude of flowers and other plants are taken up in turn and directions given for their cultivation and care. It is very compendious, thoroly practical, and is abundantly illustrated.

Stephen March's Way, by Harry Herbert Knibbs, is an ordinary love story told in the regulation way. The plot concerns itself with the chase of a man suspected of murder, the hero's love for his daughter and adventures in the woods of northern Canada. This makes good summer reading. (Houghton Mifflin Company, $1.25.)

THE WEEK

Mr. Roosevelt's Libel Suit

The trial of ex-President Roosevelt's libel suit against George A. Newett, editor of the Ishpeming *Iron Ore,* a weekly paper, for the publication of an article in October last asserting that Mr. Roosevelt "got drunk," began in Marquette, Mich., on the 26th ult. The plaintiff testified at length as to his temperate habits, and was supported by the evidence of many well known men, including four physicians, Jacob A. Riis, James R. Garfield, Gifford Pinchot, Dr. Lyman Abbott, and Collector Loeb. It appeared that Mr. Roosevelt has occasionally taken a little white wine, sometimes one glass of champagne at a banquet, and occasionally at night, after speaking in public, a spoonful of brandy in a goblet of milk.

On the 31st the trial suddenly ended, because the defendant admitted that he had been misled. He had published the assertion in good faith, believing it to be true, but recently had been unable to obtain evidence in support of it, and he was imprest by the testimony of Mr. Roosevelt and the latter's witnesses. His statement was virtually a retraction and an expression of regret. Mr. Roosevelt said that as he had achieved his purpose he would ask for only nominal damages. Under instructions from the court, the jury awarded damages in six cents. Mr. Roosevelt and Mr. Newett shook hands.

Secretary Bryan's Peace Plans

Eight nations have responded favorably to the peace agreement proposal recently submitted to them by Secretary Bryan. They are Italy, Great Britain, France, Brazil, Sweden, Norway, Peru and Russia. Some endorsed the principle and asked for suggestions in regard to details, while others said the proposition was received sympathetically. The plan, in substance, was that the United States was prepared to enter into an agreement with any country providing for the investigation of all disputes of any character and nature by an international commission, the contracting parties agreeing not to declare war or to begin hostilities until the completion of the investigation and the submission of a report. The investigation is to be made upon the initiative of the commission; and the parties reserve the right to act independently after the report is made known. To those expressing a willingness to confer as to details, a tentative statement has been given, embodying President Wilson's suggestions.

The treaty of general arbitration with Great Britain, which was to expire by limitation on June 4, has been renewed for a term of five years. Similar treaties with France, Spain and Italy have been renewed, and an intention to prolong the life of such agreements, now in force, has been exprest by Japan, Norway, Sweden and Portugal.

The Dispute with Japan

It is expected that Japan will soon send another note to Washington, thinking that our Government's final word has not been said. At Tokio the political Opposition has been using the California dispute to discredit the present Ministry. Partly on this account the Government took several of the Opposition leaders into its confidence, showing to them our Government's recent reply to Japan's protest. Because sensational dispatches had been sent to Tokio from San Francisco, Secretary Bryan, on the 26th ult., instructed the American Chargé in Japan to deny emphatically the report that this country was preparing for war. He explained that a few artillerymen had been sent to Hawaii in obedience to orders issued several months ago. Dispatches from St. Petersburg say that a secretary of the Russian Embassy at Washington, now in that city, asserts that the controversy is of the most serious character, and suggests that it can best be settled by a sale of the Philippines to Japan.

The London *Standard,* in an editorial article, advises Japan to deal with the question as a business matter and not to bring into it sentiments of offended racial pride. It points out the attitude of British Columbia and Australia toward Japanese immigration, and says, of the Japanese, that no people aim more successfully to squeeze out foreigners who are striving to make a living among them. "It is unthinkable," says the article, "that Great Britain could view with indifference any disposition on the part of her present allies to attack America. Between the people of the great republic and ourselves there are ties of

blood and common interests which could under no circumstances be disregarded."

Decoration Day

The most impressive and interesting of the ceremonies that marked the observance of Decoration Day were those which attended the dedication of the monument erected, at a cost of $175,000, at the Columbus Circle entrance to New York's Central Park, to the memory of the 267 officers and men who lost their lives when the battleship "Maine" was destroyed, on February 15, 1898, in the harbor of Havana. In the Hudson River were eleven battleships of the Atlantic fleet and the Cuban warship "Cuba," which had brought 170 officers and men, a company of soldiers, and Cuba's national military band. The unveiling of the monument was preceded by a parade, in which soldiers of the regular army, the militia, Spanish War veterans, Cuba's representatives, and 5000 bluejackets from the fleet took part.

At the monument there was prayer by the Bishop of New York, followed by an address in which General James Grant Wilson presented the memorial to the city. After the unveiling, the battleships thundered a salute, and Father Chadwick (chaplain of the "Maine") laid at the foot of the monument a wreath sent by President Wilson. Other wreaths followed, placed by the Governor of Maine, and by representatives of the State and City of New York, of Cuba, and of the fleet. The last was in the hands of Rear Admiral Sigsbee, the "Maine's" commander.

Ex-President Taft said, in the course of an appropriate address, that the destruction of the ship was not charged to the Spanish Government, except in so far as that Government might be held responsible for the protection of a friendly power's warship. But the reports of two boards left no room for doubt that the explosion was due to an outside cause and a hostile hand. It made war inevitable. There were addresses by Secretary Daniels, Governor Sulzer, Governor Haines of Maine, Rear Admiral Sigsbee, Señor Calderon (Cuba's representative) and William R. Hearst, who had been prominent in raising by subscription the money expended for the monument, and whose little son George had released the veiling flag.

Canada's Naval Aid Bill

In the Canadian Senate, on the 30th, the Government's bill, appropriating $35,000,000 for the construction of three dreadnoughts to be added to the British navy, was lost, by a vote of 27 to 51, the majority supporting an amendment, offered by Sir George Ross, the Liberal leader, saying that the Senate was not justified in giving assent to the bill until after it had been submitted to the judgment of the people.

No further action this year is expected, as Premier Borden says he does not intend to appeal to the country in the near future.

Central America

The retiring Minister from Nicaragua, Dr. Salvador Castrillo, said, on the 25th ult., he was confident that the treaty with his country, negotiated by President Taft, would be ratified at Washington. He also expected that an interoceanic canal across Nicaragua would be constructed. The Panama Canal, he continued, was of military and strategic importance, but a canal on the Nicaragua route was a commercial necessity because it would reduce the distance by water from our east coast to our west coast by 2000 miles.

Four or five days later it became known that the treaty to which he referred, and which gives to the United States an exclusive right to make a canal on the Nicaragua route, had commended itself to President Wilson, and that Secretary Bryan had said to members of the Senate committee he hoped it would be ratified. We speak of this treaty on another page. Our Government does not intend, of course, to make another canal, but it has desired to control the route and to gain the naval station, on the Gulf of Fonseca, which is granted by the treaty.

Cuba

It is expected that Cuba will consent to a settlement by arbitration of the claims of Great Britain, France and Germany for damages suffered by their citizens during the revolutionary disturbances in the three years ending with 1898. A Senate committee recommends such a settlement. The claims amount to about $2,000,000.

The new Government finds that under President Gomez there were large unauthorized expenditures and a misappropriation of public funds. In a message to Congress President Menocal calls for economy, asking for the discontinuance of the annual appropriation of $25,000 as a secret service fund for the President, and the abolition of several offices created at the suggestion of his predecessor. Offices have been held in Havana by many newspaper men. All of these have now been dismissed by the Mayor. General Riva, the new supervisor of police, has resigned, saying the efforts of the police force are nullified by the judges,

who, he asserts, acquit defendants against whom there is ample evidence.

Mexico

It was reported last week that negotiations in Paris for the loan of $100,000,000 had failed, owing to lack of confidence in the Huerta Government. The report was denied two days later. There was some anxiety at the Mexican capital about this loan, as the Government, on account of the National Railways, which it controls, was required to pay $10,000,000 of notes maturing this week, and intended to borrow $27,000,000, on notes for two years, at 6 per cent, to meet this obligation and a similar one, amounting to $13,000,000, due in November. The Government's credit abroad is affected by the failure of our Government to give it formal recognition.

Dr. William Bayard Hale, the author of articles about President Wilson, published during last year's campaign by Mr. Page, recently appointed Ambassador to Great Britain, is in the Mexican capital, making inquiries and conferring with public officers. It is asserted that he is in Mexico as a personal representative of the President. But recognition will be deferred, it is said, until after the election in October. Huerta has not issued an official call for this election. Felix Diaz is an avowed candidate for President, but has recently lost popularity. Two other candidates, it is expected, will be Minister De la Barra and Manuel Calero, formerly Ambassador at Washington. There was a report last week that Porfirio Diaz had sailed from France for Mexico, but it appeared to be without foundation.

The fighting continues, and it is said that there are more armed men in the field than ever before. Rebels have invaded the Federal district. There was an engagement with them in a suburb of the capital. They have taken the second city in Michoacan. In Monterey a mob attacked the palace, and sixty were killed before the assailants retired. Two Federal officers were publicly executed in Juarez because they had conspired to promote a revolt that would give the city to Carranza's rebels. Near Laredo, Tex., 200 of these rebels were surprised by a Federal force and defeated. Near the west coast the rebels were pressing the Federals in the vicinity of Guaymas. They were assisted by Didier Masson, a French aviator, who circled over the city dropping bombs in the streets, where they caused some loss of life. Five times he passed over the Federal gunboat Guerrero, lying in the harbor, and was not harmed by shots from this warship.

South America

Owing to the discovery, on the 25th ult., of a plot for the assassination of President Gomez, of Venezuela, eighty persons were arrested. It is said that he was to have been killed on that day, while attending the races in a suburb of Caracas. General Hernandez, a well known Venezuelan revolutionist, now in New York, says that the reported discovery must have been a trick to enable the Government to imprison those who had criticised and opposed it. On the 24th, General Mariano Perez, a Venezuelan planter and manufacturer, now in New York, received from President Gomez a cable message in which he said: "Complete peace reigns thruout the republic. No fear of order being disturbed." General Perez says that mischief makers are misrepresenting the attitude of the people toward the Gomez Government.

It is understood in Washington that Benton McMillin, of Tennessee, formerly a member of Congress, and afterward Governor of his state, will be appointed Minister to Peru, and that the new Minister to Colombia will be T. P. Thompson, of Texas.

German manufacturers, overcoming the competition of those in the United States, have obtained large orders for electric machinery to be used in Chilean power plants by a company engaged in developing copper deposits.

British Topics

A bill to give Scotland a home-rule Parliament, somewhat on the lines of the Irish Home Rule bill, has past its second reading in the House of Commons. The measure was introduced by W. H. Cowan, member for East Aberdeenshire, and is not likely to go very far at the present session.

Mrs. Pankhurst was rearrested on May 26 under the terms of the Cat and Mouse bill. The arrest was made when the militant leader left the nursing home at Woking—in the intention, it was said, of taking part in a suffrage meeting in the London Pavilion. Mrs. Pankhurst had been free, tho under surveillance, since April 12, when the state of her health, reduced by her refusal to take food, reached a state of gravity. Rearrested, she announced that she would again "hunger-strike," and she kept her word. On the evening of the 30th she was again released. She has now served thirteen days in prison, and spent six weeks outside, since her sentence to three years imprisonment.

Car drivers are on strike at Bradford,

and strikes of iron-workers and miners in the "black country" and at Sheffield are reported. The strikers demand a minimum wage for unskilled laborers. Forty thousand men are idle.

The departmental committee appointed in 1911 to investigate the jury system presents a majority report, signed by five out of nine members, recommending a limitation of the right of trial by jury in certain civil cases. A minority report recommends still more drastic reforms.

"An Irish Putumayo" is Sir Roger Casement's description of conditions in South Connemara, on the west coast of Ireland. The natives of this insular region are suffering from famine fever. Contributions for those in dire need are being taken by the *Irish Independent*. Augustine Birrell, Chief Secretary for Ireland, has visited the scene and reports frightful conditions. The Aran islands, visited and immortalized by the playwright John Synge, are off the coast of Connemara.

Growing antagonism to the workings of the insurance act is blamed for the increase in the Unionist majority at a by-election which took place on May 28 at Altingham.

In Germany

The new Army bill, providing very large augmentations, was put thru the Budget Committee of the Reichstag on May 28 and will be reported to that house on June 10. Socialists, Radicals and National Liberals joined in support of the Government bill, as slightly amended, against the Conservatives and Centerists.

German banks have received orders from the Imperial authorities to disburse paper currency only—and will hoard gold.

The steamship "Imperator," of the Hamburg-American Line, made a speed of 23 knots per hour on her trial trip, May 26. She was thrown open to inspection at Cuxhaven on May 28. The maiden voyage of this, the largest ship afloat, is scheduled for June 11, when she will leave Hamburg for New York. On May 26, Germany's newest battleship, the "Koenig Albert," went ashore off Danzig. This was her maiden voyage. The dreadnought has a tonnage of 24,000 and cost about $12,000,000. On the 30th the German cruiser "Blücher" went aground in the Great Belt.

The Siemens-Schuckert Electric Works of Berlin have obtained contracts for gigantic power plants in Chile, worsting their American rivals. The first order represents $3,000,000, and others will follow. The Chile Exploration Company, which gives the contracts, is said to represent North American capitalists, who plan the exploitation of copper mines in Chile after the opening of the Panama Canal.

France

On May 26 bills increasing taxes by almost $40,000,000 annually were introduced in the French Chamber of Deputies. Four and a half millions of the amount is to come out of alcohol; life insurance, land, mines, stocks, etc., will supply the rest. Moving picture films are taxed, by the bill, 2 cents a meter, and this tax is estimated to be worth $1,200,000 a year. On the other hand, the Chamber has voted to reduce the import duty on horses intended for slaughter from $30 to $10. This brings out the fact that there are in France 700 establishments where horses are butchered. In a year Paris consumes 60,000 animals, valued at from $40 to $50 each. The meat is sold at 3½ cents a pound. The reduction in the duty is made to counteract in some degree the higher cost of living.

The general advance in French taxation is due to plans for military improvements, and a longer term of compulsory service. The Government's projects include a progressive impost on incomes over $2000. This tax is denounced by Yves Guyot, the economist, as class legislation, a violation of the revolutionary principles of 1789, and a sop to the Socialists. Income taxation has been the theme of much discussion in France during the last decade, and is a very unpopular suggestion so far as the prosperous middle class is concerned: the class which has, from the establishment of the Third Republic up to the present time, dominated the Parliament.

The French Cabinet is said to be considering the creation of an under-secretaryship, to be attached to the Ministry of Labor, the duties of which would be to look after physical education and sport. There have been recent indications that military and naval authorities are taking more interest in this subject than formerly, and for a number of years sports have occupied a larger share of popular attention, not only in the minds of the more fashionable citizens, always subject to British influence, but also in the schools of the country.

Italy

The defeat suffered by the Italian troops under General Ganbretti in a battle with Arabs at Sidi Garba, Tripoli, on May 16, was more serious than first reports indicated. The Italian losses in men killed, wounded and made prisoners are now given at 1000—and this at Rome. The Italian force engaged numbered 5000. The Arabs

were twice as numerous, it is said, and were commanded by Turkish officers. The Arabs feigned a retreat, then took their pursuers by surprise. Besides making prisoners, they captured Italian artillery, ammunition and stores.

The Italian government is promoting a scheme for the construction, in the Sila range of granite mountains, better known as Aspromante, of three great artificial lakes. Besides irrigating a great deal of table land, the lakes would furnish 150,000 horse power for industrial purposes in the south— in Calabria and Apulia. A great reservoir is already under construction in Sardinia, in a malarious region bordering the Tirso River. This is to drain 50,000 acres of marshes, and to provide power for electric lighting and traction for the Sardinian mines. Private companies are chartered for the work, but, after sixty years, during which time the government is entitled to service at cost, the improvements are to pass into the possession of the state, without any cash payments.

The Catholic delegation in the Italian Parliament, consisting of only fifteen members in the present house, will be increased to more than 100 at the coming elections, it is estimated. This is one of the probable results of the extension of the suffrage. Twenty-eight Parliamentary candidates have pledged themselves in favor of woman suffrage.

Ernst Nathan, Socialist Mayor of Rome, threatens to resign his office owing to partisan discord.

The Italian Government has asked Austria to establish an Italian university at Trieste—a city on the Adriatic Sea whose population is largely Italian, and whose students have frequently made demonstrations against the Austrian Government.

The first open-air audience granted by the Pope since his recent illness was accorded on May 29 to 3000 pilgrims, who gathered in the courtyard of the Vatican. The Pope appeared on the balcony at 5 p. m., and gave his blessing. The Portuguese legation to the Vatican was abolished last week, in consequence of the separation of Church and state in the Republic.

Vesuvius has shown renewed activity.

A Spanish Crisis

On reaching Madrid on May 30, greatly depressed because the royal train had killed a child on the tracks at Utrera, King Alfonso received the resignation of the Count de Romanones and his cabinet. Two days later the latter consented to resume office, with the same ministers as before. The reconsidered resignation followed a violent attack by the Conservative leader, Señor Maura, in the Chamber. The former premier accused the Romanones government of submitting to "the disorderly elements" in Spanish politics. Its policy was, he said, a "poisonous Styx," which all anti-revolutionaries should combine to dam. Señor Maura asserted also that the Spanish military policy in Morocco had proved a failure.

The Count de Romanones took office last November, after the assassination of his predecessor, Señor Canalejas. The attack by the Conservative chief is in some quarters held to be a slap at the King, whose conversations with Republican leaders have shocked the Spanish standpatters.

Only last month railway construction, and military and naval aggrandizement, were announced as parts of the ministerial program. The building of a second naval squadron figured in the budget submitted to the Chamber of Deputies by Minister of Finance Inclan on the 28th. The Minister estimated the expenditures at $231,000,000 and the revenues at $240,000,000. His great object, he explained, had been to obtain a better distribution of the burden of taxation without increasing it.

Peace in the Balkans?

A preliminary treaty of peace between Turkey and the Balkan allies was signed at St. James's Palace, London, May 30. Sir Edward Grey, British Foreign Secretary and spokesman for the concert of powers, superintended the signing of five copies of the document. On June 2 a further peace conference was to be held.

Explaining his signing of the preliminary treaty, the Montenegrin delegate exprest himself as welcoming peace, but profoundly dissatisfied with the terms accorded his country—which felt, he added, as he did.

The state of war had lasted for a period of 234 days. Tho peace between the original combatants is re-established, the relations of the various members of the Balkan League are far from satisfactory. Servia and Bulgaria were reported last week to be upon the brink of a war into which the other members of the alliance, seemingly dissolved by the signing of the peace treaty, would certainly have been drawn. The real history of the war remains to be written. Austrian policy, Russia's Slavonic ambitions, even the rivalries of the different Churches in eastern Europe, are variously blamed for the attack upon Turkey so soon after the Young Turk program of reform seemed to offer hopes of amelioration. And if the world in general does not yet fully understand the causes of the war, and has been misled by the distortion of war news, it is equally true that the final act in the drama is yet to be staged.

ADVERTISING AFFIRMATIONS
BY GEORGE FRENCH

XV—Readers Returning to Sanity

People who do not arrive at their conclusions thru premises created in a month or a year are noting that the masses of people, who are to be classified as "readers," are returning to sanity in their patronage of periodicals. The day of the newspaper or magazine that seeks chiefly to cater to mercurial and diseased tastes has passed—at least, the meridian of that day. A canvass recently made by the New York *Times* of a number of newsdealers, located in city and suburbs, gives such confirmation of that fact as cannot be gainsaid. It is important to note the results of this canvass, and so I give the figures:

Twenty dealers, located in New York City, Brooklyn, Mount Vernon and Montclair, N. J., were taken as representative of the whole circulation. These dealers handle 14,498 copies of eight morning New York newspapers. Of this total the *Times* has 5545 copies, or 38 per cent of the total. Of the total 10,628 are delivered at homes, and the *Times* gets 4467 of these, or 42 per cent. There are 7658 copies delivered to houses where but one paper is taken, and of these there are 3318 copies of the *Times*, or 43 per cent.

I have no disposition to boom the *Times*. Its bright business men are doing that sufficiently, and efficiently. But the *Times* is the conservative paper of New York. It prides itself that it is conservative—so conservative that it prints nothing but "All the news that's fit to print"; which is a matter of opinion. Nothing is fit to print which does not square with the policy of the paper and the idiosyncrasies of the editors thereof, so we are not obliged to believe it is because the *Times* prints all the expurgated news that it is so in the lead in circulation in the homes. It is in the lead in the offices and in the cars, just the same, among the people who like the kind of newspaper the *Times* is. But where do the papers with the big and inflated circulations go? Who reads them? They print all the news that's fit to print, also; and then some. Where do they go? I read the *Times* before breakfast, and leave it on the living-room table. It is read by the ladies of the household—read, mind you. They see more in it than I do, as I find to my cost, upon returning to dinner, as I am unable to discuss much that they saw and I did not. I buy another paper at the station as I begin to commute toward the city, and leave it in the car-seat. When I return home at night I buy two or three papers—one, and often two or three, that I skim over in the train, and leave on the car-seat. One that I always take home, read comfortably after dinner, and pass to the ladies, who read it carefully and comfortably, after the household is duly regulated for the night.

Now, which of these papers is the good advertising medium for reputable dealers in staple goods? What is true of newspapers is true also of weeklies and monthlies. Which of the two classes are the better advertising mediums for merchants and manufacturers who wish to get into sympathetic touch with people who habitually purchase staple goods, luxuries, specialties, etc., and who are always looking out to better themselves, in price or quality?

The question answers itself. There are several newspapers in New York that have greater circulations than the *Times*, but it is apparent that there is none that is better read in the homes of people who are able to purchase the necessities and luxuries, and that makes it evident that the *Times* is a better advertising medium than those papers that, while they may print more copies, are read in the cars and at odd moments in offices, on street corners and park benches, and then cast aside and forgotten. And it is as evident that those periodicals that place quality ahead of erotic titillation, or the playing up to passing moods or fashions, are immeasurably the better advertising mediums.

THE INDEPENDENT belongs to this first-mentioned class, and is proud of it. In the long run, these are the periodicals that achieve real success, and are found in the same families generation after generation. There are many good signs that they are now about to come into their own, that people are turning from the sensationals to those that they know where to find, all the time.

Not only do we feel a distinct return drift to THE INDEPENDENT, which has already more than compensated for the small loss—the almost insignificant loss—that we were aware of when the extreme sensationalism of a certain class of weeklies and monthlies was most strikingly in evidence—but we are

pleased to note that large advertisers are turning more freely toward conservative mediums that have not lost their heads or sacrificed their sense of proportion.

By conservative I do not mean the same as Douglas Jerrold meant when he said that "a conservative man is one who will not look upon the new moon out of consideration for that ancient institution the old moon." Conservative journals like THE INDEPENDENT have all along given full recognition to the new moons of the times, and have merely refused to believe that those moons were composed of green cheese.

The little group of sane periodicals, whose conductors have gamely clung to their sanity, and persistently kept faith in the ultimate sanity of their readers, are now feeling real satisfaction in such an exposé as that of the *Times*, knowing that it is more than an endorsement of the policy of the *Times*. It is, in fact, a sharply graphic indication of a marked tendency away from sensation in newspaper and periodical literature.

This tendency is of great consequence to advertisers. It adds to the effective value of their announcements, that are printed in these papers and periodicals, a percentage which they have not yet ventured to estimate but which they are already fully aware of. Advertising mediums give their character to the advertisements they print. If they have not themselves the trust and confidence of their readers, the advertisements they print will not have the confidence of their readers.

This basic idea, that profitable circulation for the advertiser is found in the reading constituencies of these sane periodicals —such periodicals as THE INDEPENDENT— is attracting the very serious attention of the shrewdest advertisers. They are beginning to have faith in quality of circulation rather than in quantity.

It is plain that a very large circulation of the wrong kind might do an advertiser an irreparable injury. "A man is known by the company he keeps" is one of the old copy-book adages that has proved its truth thousands of times in every generation. It is the same with advertising. It is known and judged by the mediums in which it is printed. A million circulation, or two millions, does not signify so much as the habitual character and tone of the editorial contents of the papers and periodicals in which it is printed.

For more than sixty-five years THE INDEPENDENT has sought for quality circulation. It got it in the beginning, has kept it all thru the years of its life, and has it now. It has never gone off after the false gods of gifts, premiums or prizes to lure people to subscribe to it. It has made use of the subscription agencies, as all magazines have, because they have become useful to subscribers who wish to place one order for their periodical literature. But as a general proposition, the circulation of THE INDEPENDENT has always been upon the basic principle that the magazine is worth the subscription price asked for it, which has always been sufficient to pay for the manufacture and distribution of the magazine. The advertisers have never been called upon to make up circulation deficits. They have been charged enough to pay for the production of their portion of the magazine, and a small margin of profit on their portion of the investment.

There is a radical difference between such newspapers as the *Times* and such magazines as THE INDEPENDENT, and those newspapers and magazines that have made such frantic attempts to get phenomenally big circulations, and have debauched pretty much all the established principles of journalism in doing so. The *Times* is read and esteemed because it is a good newspaper— comprehensive and fair in its news policy and broad-minded and able in its editorial policy. Its ultra sensational contemporaries are bought for specific thrills which they promise, by raucous newsboys, black headings and red lettering. THE INDEPENDENT is read and esteemed for its good literature, its carefully prepared reports upon the progress of the world, its able estimates of the great movements of the times, and its free renderings of the thought of the best minds. Its ultra sensational contemporaries in the weekly and monthly fields are bought because the last paragraphs of the current installments of the wild yet clever serials are likely to leave the heroines dangling in thrilling situations fraught with moral or physical peril.

The distinction is obvious. Such periodicals as the *Times* and THE INDEPENDENT are bought and read because they are newspapers and journals of progress and thought. The others are bought for the specific bits of excitation they offer. Readers are tiring of the jerky and enervating influence of the sensational journals, and are turning with fresh interest and enthusiasm to the other type.

IN THE INSURANCE WORLD

BY W E. UNDERWOOD

Life Insurance Surplus

A Kansas newspaper recently asserted that "the great life insurance companies have prodigious and constantly growing assets and surpluses running into hundreds of millions of dollars, none of which will ever be distributed among their policyholders, to whom this money belongs."

The man who wrote and printed that statement occupies one of three positions: he thought it was true; he knew it was untrue; or he was totally ignorant on the subject. If he believed it was true and was not sure, he should have investigated and confirmed it before publishing it, for if he happened to be making a mistake he was misleading many people who had confidence in his knowledge; if he deliberately misrepresented the matter, he violated the confidence of his readers; if he was without knowledge on the point, he is unfit for the position of counsellor and guide in that particular.

The facts are extant in the Insurance Department reports of Kansas. If that editor will procure a copy, a pad of paper and pencil, he can with the assistance of common arithmetical skill settle the question for himself. President Kingsley, of the New York Life Insurance Company, commenting on the statement, observes that the unallotted surplus of his company at the end of 1912, as shown by its sworn report, was but $7,500,000, a trifle more than 1 per cent of its assets. The remainder, some $85,000,000, has been apportioned among the policyholders and is charged up in the company's books against it as a liability. The conditions in the other great companies are similar. Their surpluses are apportioned every year, the small amount retained being held to provide against contingencies.

Million Dollar Burglary Policy

Altho of comparatively recent origin, that form of protection known as burglary insurance has grown to vast proportions in recent years. It is taken by banks, merchants and householders and has been equal to every underwriting demand made on it as a practicable distributor of losses resulting from the depredations of dishonest employees, servants and the guild of professional thieves and burglars. Within the past five years the number of companies transacting it in the State of New York has grown from seventeen to twenty-seven, while the total premiums have increased from less than two millions to more than four millions a year. Of late years, in exceptional cases, policies for $100,000 to $250,000 have been issued on single risks; but it remained for a New York insurance broker, Robert A. Sasseen, to break the record for size and amount of premium when he recently procured a policy covering the establishment of Henry McAleenan, of New York City, for the sum of $1,000,000 at a premium of $1200. The McAleenan vaults and safes contain several million dollars' worth of jewelry, precious stones and objects of art and, altho they are regarded as burglar proof and are additionally protected by an electric alarm police service, the successful assault made by a burglar several months ago on a fortress of similar strength, resulting in a loss estimated at $500,000, decided the insured in this case to supplement his protection with a burglary policy of ample proportions. The insurer has reinsured nine-tenths of its liability.

Commercial Bodies Active

At the annual meeting of the Missouri Bankers' Association, held at St. Joseph, Mo., last week, a resolution was adopted requesting the governor of the state to call an extraordinary session of the legislature to take some remedial action on the conditions which have forced the fire insurance companies to suspend business there. The business people of the state are convinced that the companies are sincere and earnest in their refusal to operate under the Orr law, and they realize the danger consequent upon a prolonged absence of fire insurance protection. Attorney-General Barker, who is principally the cause of the trouble, announces that he will endeavor to bring about a Congressional investigation of the fire insurance business. It is understood that Governor Major will decline to convene the legislature, and that he opposes a referendum.

FINANCE & TRADE

Bankruptcy of a Railroad

May was a very dull month on the Stock Exchange, and the general depression was emphasized in the final week by the bankruptcy of the St. Louis & San Francisco Railroad Company. Transactions during the month amounted to only 5,409,014 shares, the smallest total for any May since 1904. In May of last year the number was 12,831,945, and the May average for eight years ending with 1912 was 16,754,000. But the Exchange has not done much business since this year began, the monthly average since January 1 having been less than 7,000,000 shares. Trading has been discouraged or restrained by proposed legislation affecting the Exchange, by the approaching tariff changes, currency plans, the situation in Europe and other causes.

The stocks and bonds of the Frisco railway system, as it is commonly called, have shown weakness for some time. On the 27th ult. receivers were appointed, in St. Louis, for the main corporation, and in Chicago for the Chicago & Eastern Illinois, a subsidiary. Sharp declines followed. Frisco common at the end of the week was selling at 3⅛, the first preferred at 14½, the second preferred at 6½, and the general mortgage 5 per cent bonds at 56¾. At these prices the capital stock of $50,000,000 has a market value of less than $3,000,000. The immediate cause of the appointment of receivers was the company's inability to meet notes for a little more than $2,000,000, maturing this week.

It does not appear that this company's condition indicates any general weakness in the railways of the country. For some time the company had been carrying a heavy load. Altho its capital stock was only $50,000,000, its bonded indebtedness was nearly $300,000,000. Its lines are mainly in the southwest. It has had a checkered career, having been at one time associated with the Atchison, and at another with the Rock Island. Since it became independent it has absorbed several roads by purchase of stock, sometimes paying high prices and making burdensome guarantees as to dividends. Some of the lines thus acquired have suffered by floods and coal mine strikes. The country traversed in the southwest has been growing, but its development has not been sufficiently rapid to give the system all the traffic needed.

The receivership is what is called a friendly one, the receivers of the main company being the company's president and the head of a St. Louis banking house heretofore associated with the management. It is asserted that prominent bankers interested in the bonds were not consulted. For this reason the action taken is criticised. Obviously, with the bonds so largely exceeding the stock, the interest of the bondholders and of the bankers representing them deserved much consideration, both in the receivership proceedings and in the reorganization.

About $30,000,000 of the bonds are held in France, and a considerable quantity of bonds was sold in Paris a few weeks ago. These are quoted now at prices much below those which were paid. There is sharp dissatisfaction in Paris, where, on account of this bankruptcy, all American securities are now under a cloud. Dispatches assert that the President of the Bourse says he will not permit any more American bonds to be placed on the official list. The effect of the bankruptcy is thus seen to be unfortunate abroad. Representatives of French bondholders are coming to this country. Inquiry will doubtless be made by them and by the protective committees formed here. If those who have controlled the company and have been influential in the receivership proceedings have in any way transgressed the rules which should govern all such transactions, and have not been true to the interest of the bondholders, this should be made clear. The good name of American railway securities abroad is to some extent involved.

The New York, New Haven & Hartford Railroad Company is expending $650,000 in the construction of an electrical equipment and repair plant, covering two acres, in the New York Borough of the Bronx. The plant will be the most complete of its kind in the country, and will be finished by August, or a short time before electric power is substituted for steam power between Stamford and New Haven. The company has ninety-nine electric locomotives.

The Independent
A Weekly Magazine
Founded in 1848
June 12, 1913
VOLUME 74 NUMBER 3367

The Pity of It

Oh! the pity of it that there should be, in so many industries, a state of war between those who receive and those who pay wages for labor. It would seem that in some equitable way this conflict could be settled, and peace obtain. It is war; men are murdered; men, women and children are starved; they are driven out of their homes; they suffer, as in international war, all sorts of privations, and willingly, for a cause which they believe higher than patriotism, for the personal rights they believe dearest to them. As in the war between nations, millions of property are destroyed by loss of wages or by violence or the cessation of industry. It is in the mines, in the factories, thousands of workmen warring against their employers, employers refusing to yield, one wrong or both wrong, but both inflamed with mad passion, and no great constructive plan universally adopted by which agreement can be reached. Oh! the pity of it.

And the madness of it! When in Belgium the other day the workmen declared that they were politically ill treated they struck, and they succeeded without any madness of violence. The leaders forbade violence and were obeyed. In this country the leaders sometimes forbid and sometimes counsel violence, but violence comes all the same. The leaders who directed the blowing up of bridges and printing houses are in prison for it; and in Paterson a leader has just been convicted for inciting violence, and several others will be tried; and their followers enthusiastically support them. This is war; this is madness. What is it but madness, absurd, criminal madness, when Haywood, chief leader of the I. W. W., tells his followers that this year they will get an eight-hour day, and next year demand a six-hour day, and will get it? That is not for the benefit of labor, but for the overthrow of industrial society. It is the madness of convulsion that is sought, not peace, not kindly partnership between capital and labor. It means that labor shall take everything and that capital shall be annihilated. Oh, the madness of it and the pity of it!

For these clashes of interest some remedy must be found. In different ways Socialism and the Industrial Workers of the World offer the cure of revolution, the latter by violence. Have they, or either of them, the true panacea? Is there nothing to be learned from the compulsory arbitration acts of New Zealand and Australia, from the compulsory investigation acts in Canada, from the voluntary peace protocol in the great garment trade in New York? We are weary of this mob madness which interrupts industry, plagues the community, destroys property and life, and makes hunger strikes of every protracted conflict vastly worse than those of the British militant women. Just now we are having such strikes near us in Brooklyn, in the Paterson silk mills, in the Wharton mines, in the larger mining districts of West Virginia; and tomorrow a dozen other industries may be attacked. Nor is this merely an American problem. It is instant and violent in France, in Great Britain, and anywhere else where despotism does not rule. Oh! the pity of it.

A Corporation Super-Tax

The new Attorney-General of the United States, Mr. McReynolds, says that the dissolution decree of the Supreme Court in the Tobacco Trust case was a subterfuge and a miscarriage of justice. Because the independent companies in the tobacco business find it difficult to compete profitably with the corporations which were formerly parts of the Trust, he proposes a graduated internal revenue tax, rising with the growth of output, to discourage the existence of these large concerns. A Senator has introduced a tariff bill amendment for the imposition of such a tax. He points out that, in the present condition of the industry, it would affect only six companies. The additional tax, he says, would be $7,500,000 a year for one of these, and $3,100,000 for another. It may be noticed that on account of this proposition the market price of the first company at once lost $27 a share and the price of the other $21½.

It is the duty of the Attorney-General to enforce the Federal statutes. By the court's dissolution decree the separated parts or subsidiaries of the American Tobacco Company were forbidden to do business under any agreement or combination understanding as to prices or output. They were also forbidden to use unfair or unjust and oppressive methods in competition. Have they disobeyed the court's order? If so, Mr. McReynolds should promptly prosecute them. He could have them indicted for violation of the law, or could proceed against them for contempt of court. But, so far as we can learn, he does not assert that they are either violating the law or disobeying the court's decree. If it be true that they do not offend in these ways, his proposition is that they shall be punished for their size and for doing too much business. If they are not guilty of unlawful combination or of unjust practices in competition it follows, also, that he would have them punished, and even taxed out of existence, because of the efficiency of their industrial and commercial methods, and of the saving due to the economies which are possible in large manufacturing concerns. When the Congress of the United States is asked to legislate in accordance with such a policy and purpose, the question should not be presented in a belated amendment to a general tariff bill.

Mr. McReynolds gave his project to the public after it had been discust at a Cabinet meeting. He represents the President at the head of the Department of Justice, and we do not understand that the project was definitely disapproved by the President, altho the publication of it did not, we are told, indicate the adoption of a policy. Mr. Wilson has never asserted that corporations should be punished because of their size. He said in his letter of acceptance that "big business is not dangerous because it is big," and he spoke of objectionable "methods" which should be prevented and for which there should be punishment. In this case there is no specification of objectionable methods. As we have said, if the companies are using such methods, they are guilty of contempt of court in disobeying the Supreme Court's order.

We are not undertaking to defend the companies, or to say that they must be classed with manufacturers who overcome competition only by intelligence, efficiency and the economies of production on a large scale. But those who propose the supertax do not allege that the companies offend by any of the methods or practices which are prohibited by the court's decree or the law, or are condemned by public opinion. If they are offending by disobeying either the court's order or the Sherman act, the supertax would virtually be a license permitting and authorizing them to violate the law for a price paid in cash. We shall be glad to hear that the project has the disapproval of President Wilson.

The Friedmann Institute Closed

The board of health by its decision that all remedies for disease using live bacilli must be licensed by the board, practically closed the Friedmann Institute for the treatment of tuberculosis with this much-advertised cure, which had just been opened. When the German pathologist came to this country he proclaimed that his only purpose was to confer a great boon on humanity by the

cure of one of the most fatal of diseases —a cure which thru professional jealousy it was hinted he had not been allowed to develop properly in Berlin. He promised that the health authorities should have full opportunity to investigate and control his work and particularly that they should be given full knowledge of the agent that he was employing, for, as is well known, biological remedies have elements of danger far beyond drugs. This promise had been made to the German government, but was not kept. Neither was it kept here.

Besides there were certain other unfavorable developments. On his arrival the inventor of the new "cure" announced definitely that at the end of six weeks the beneficent effect of his treatment would be seen beyond doubt. By that time suitable cases treated with it were to be practically cured and while, of course, they might still require a considerable time to build up physically after the ravages of the disease during the preceding months or perhaps years, they would not be hampered in this building-up process by their tuberculosis which would be definitively set at rest. He has been with us now more than three months. His announcements have been modified from time to time during that period. At the end of six weeks there were no cured cases and he declared that in a certain number of cases a second injection would be needed, and after that in a few patients at least a third injection. The indications and contra-indications for these second and third injections were not very clear. Some patients were refused them, tho they seemed to be in condition for them, others were given them in spite of apparent contra-indications such as hemorrhage and local induration persisting from the previous injection. A few patients refused to take a second injection because they were quite sure that they had not been improved by the treatment and some of them felt that they had been harmed by it.

A letter from Dr. O'Connell, the physician of the Port of the City of New York, to Commissioner Lederle, head of the New York Department of Health, brought the subject to a focus last week. Dr. O'Connell has had the opportunity to obtain inside information from the official inspectors who are watching the Friedmann cases in the various hospitals where they have been treated under governmental inspection and under the eye of the local health authorities. He demanded that no further injections shall be given until the innocuousness of the new remedy is absolutely decided. The first rule of all medicine, of course, is *non nocere,* to be sure to do no harm. In spite of the length of time that has past, the health authorities are not in a position to say as yet that the Friedmann treatment surely does no harm, and there are a certain number of cases in which local consequences of the injections have been most unfortunate and bothersome to patients and not a few in which the progress of the tuberculous process in the lungs has seemed to be hastened since the injection, and in some cases even diffusion of the pathological process seems due to some external agent besides the disease itself. In a few cases since the injections, infections of the other lung, which was free before, have been noted. Any one who wishes to know the conclusions of those whose opinions are worth while and who have had full opportunity to judge of the value of the treatment should read that letter which appeared in the daily papers.

Meantime reports at medical societies have been rather unfavorable. In a number of cases local abscesses are reported at the point of injection. In a number of patients there was a decided very uncomfortable reaction with fever, loss of appetite and general discomfort for a day or more after the injection. There are no cured cases, there are some half a dozen deaths reported since the injection, tho Dr. Friedmann was willing to make the injections in these patients, and in some of these he took money for making the injection. In a good many patients who felt much better at the beginning, shortly after the first injection was made, the temporary euphoria, the very definite sense of well being which occurs after every new treatment for tuberculosis, has disappeared. Some of these seem actually to be worse as the result of the disappointment.

In a word, the whole question is still undecided. It is just as well to realize

that it may remain undecided for many months or even for many years. Dr. Koch's serum, or tuberculin, is now before the public nearly a quarter of a century, and there are still physicians who use some form of it and apparently get good results in selected cases of tuberculosis. The men who do so are usually experts in the disease, who are thoroly capable of judging, but notwithstanding this their results are not sufficiently convincing to others as yet to make any particular form of the use of this remedy of very wide application. Life is short and art is long, Hippocrates said, nearly twenty-five hundred years ago, and the expression still continues to be most important in all that relates to the art of medicine. Time alone will tell what the Friedmann treatment is really worth. There is probably a useful element in it. There are some cases that have apparently been rather strikingly benefited, tho further time is needed to judge the meaning of this improvement in so complex a disease as tuberculosis. All his tuberculous animals treated with the cure lived longer than the control animals who received no treatment, tho all the animals eventually died of tuberculosis. As at present administered the treatment has nothing like the curative results we were led to expect from it by its discoverer's announcement, and it is possible that as with regard to Koch's remedy harm may be done with it. We can only wait, allow the government to make its careful investigations and be quite confident that when they are concluded the announcement will have a definite scientific value.

If We Were Mexico

June 1—The army has revolted under General Leonard Wood. The soldiers have not been paid since the revolution of last November, when Señor Taft was ousted from office and banished.

June 6—The Californian insurrection under Colonel (now General) Roosevelt is reported to be under control. Señor Johnson was taken and shot by the federal troops near Los Angeles.

June 10—The Wisconsin revolt under Señor La Follette, which has smoldered since last summer, has just broken forth with renewed violence. Canada has stationed six regiments near the border.

June 15—The army under General Wood has besieged and taken Washington. A provisional government under his leadership has been proclaimed. The late President, Señor Wilson, has been held for trial. Congress was hastily summoned and under threat of armed force the members were compelled to recognize the new regime.

June 16—Señor Wilson, Señor Marshall and other deposed officials at Washington were shot today while "escaping." The Government officially expresses its regret and refuses to give up the bodies to the relatives of the deceased.

June 17—The Wilsonistas of New Jersey have been making trouble. Five regiments have been sent to quell the disturbance.

June 20—Canada still refuses to recognize the *de facto* government of President Leonard Wood, altho Costa Rica and Hayti have done so. Hostile demonstrations were made before the Canadian embassy.

June 23—The State of South Dakota has been leased to a firm of Canadian capitalists. Federal authority has virtually ceased in the upper Mississippi region, and the Lafollettistas have declared Wisconsin and North Dakota independent states. It is thought that they may join Canada.

June 30—General Roosevelt has taken the city of Denver.

July 2—The State of Kansas has suffered severe loss from the raids and counter raids of the regular and insurgent troops.

July 3—Ex-President Taft has landed from Cuba. He denies any intention of trying to regain the Presidency. The city of Omaha has been retaken from the Wilsonistas, but Colonel Bryan was not apprehended.

July 4—Independence Day was celebrated with rejoicing in the capital. The treasury is empty and the State of Arkansas is mortgaged to a firm of foreign capitalists to pay for the expenses of government. There is much fear of Canadian intervention. The relative position of the two countries may be better understood when it is considered that Canada has a population of 540,-

000,000, and that under the Borden Doctrine Canada represents the claims of the world upon the American government and ensures the safety of foreigners within her borders. The day passed quietly except for anti-Canadian riots in New York.

The Wisconsin Veto

In the Presidential election of 1912 the citizens of Wisconsin voted adversely on the proposition to grant women the suffrage. The majority vote against it was 92,000; but the vote in favor amounted to the grand number of more than 136,000. It was not a favorable occasion for an appeal to the male electorate. Apart from the generally conservative position of the large foreign population, the great brewery interests and the solid saloon were against the women. Late in the campaign the movement grew in enthusiasm, and it received the endorsement of the women's clubs, while it was found that even the foreign element was open to conviction. But it was too late to convert the hesitant voters, who might have been gained by a longer effort.

However, the large vote greatly encouraged the advocates, and they asked the Legislature to allow a new referendum in 1914. The Legislature readily past the bill, but to the surprise of every one it was vetoed by Governor McGovern. He said, in explaining his veto, that two years was too soon for a new appeal to the people, and it was better to leave it till the Presidential election of 1916.

The Governor appears to be opposed to woman's suffrage. He chooses to allow time for the enthusiasm aroused by the late active campaign to cool down. He forgets, or perhaps remembers, that it is by pressing onward that any great movement gains cumulative force. The late history of Wisconsin might well have taught him that lesson. The other Wisconsin reforms which have made that state a leader in the nation began, as *La Follette's Weekly* reminds the Governor, in 1894. They lost in 1896, and again in 1898. In 1900 they won with the people but lost in the Legislature, and the same was the case in 1902; but in 1904 the progressive movement carried both Governor and Legislature. There was no intermission of effort. Every biennial election was a battle. No halt was allowed. A halt would have spelt discouragement and failure.

Of course, the good cause of the political rights of women will get the victory everywhere in the Union. At the last election it won in Kansas, Arizona and Oregon. The Presidential election is not the fairest occasion to try for it; but every chance to appeal to the people should be improved, and the Governor doubtless understands this and would thwart it as far as he can, but the Legislature should pass the bill over his veto.

A Question Answered

It was in an incidental way, in an editorial on "The American Pope," we spoke of our country as one "whose form of government has been and still is formally condemned by the Church of Rome." We have been more than once asked to justify that assertion.

We said "formally," not *specifically*. There has never been a specific mention of our country as having a form of government to be condemned.

Our form of government is one based wholly on the will of the people. Again, it is a form of government in which the state is free from all control of the Church. Again it is a form of government which requires free public education uncontrolled by any Church. All these principles have been formally condemned by Rome. Doubtless many, and we trust most, Catholic leaders in this country accept these American principles, but they are officially condemned; altho they are "tolerated" where this cannot be helped, under the consideration of *tolerari posse*, that they can be endured because of the hardness of the American heart.

First, as to *the will of the people* as the basis of government. The Church of Rome has condemned this principle more than once. Perhaps the latest case was in the letter of Pius X in 1910 to the Episcopate of France, condemning the liberality of the Sillon. We quote:

> The Sillon places the origin of public authority in the people, from whom it goes to the rulers, but in such a way that it continues to rest with the people. This was

formally condemned by Leo XIII in his encyclical "*Diuturnum illud*" on the Constitution of Christian States, in which he writes: "Many modern thinkers, following in the footsteps of those who in the last century called themselves philosophers, declare that all power comes from the people; that consequently those that exercise power in society do not exercise it of their own authority, but as an authority delegated to them by the people, and on the understanding that it may be revoked by the people. Catholics, however, hold that the right to rule comes from God as its natural and necessary principle."

When the Sillon admitted, as all Christians do, that *all* power comes originally from God, Pius proceeds to show that this does not meet the point; and he further quotes Leo XIII, that election by the people "may single out the ruler, but it does not confer on him authority to rule, it does not delegate power to him; it simply points out the man who is to exercise."

The American form of government is based on the theory here condemned. It holds that "those who exercise power in society do not exercise it of their own authority, but as an authority delegated to them by the people, and on the understanding that it may be revoked by the people." On that understanding Charles I was beheaded; on that understanding our "recall" and impeachments, even of a President, are based. This doctrine is implied all thru our Constitution, and is definitely stated in the Declaration of Independence, which says, following the "philosophers" referred to:

> Governments are instituted among men, deriving their just power from the consent of the governed; that when any form of government becomes destructive of these ends, it is the right of the people to alter or abolish it, and to institute a new government, laying its foundations on such principles, and organizing its powers in such form, as to them shall seem most likely to effect their safety and happiness.

Again, it is one of the principles of our form of government that it shall be *free from Church control,* and entirely separated from the Church. On this matter it is enough to quote from the Syllabus of Errors promulgated by Pius IX in 1864. That Syllabus was a long list of errors condemned by the Pope, acting as he did under the right of infallibility. The following is one of "the errors of our time which are stigmatized":

> LV. That the Church ought to be separated from the state and the state from the Church (*Ecclesia a Statu, Statusque ab Ecclesia sejungendus est*).

A third principle of our government, but dependent on the second, is that free *public education should be uncontrolled by the Church.* That this principle is condemned by Rome hardly needs evidence, for here at home it is attacked constantly by high ecclesiatics. We satisfy ourselves with quoting from the same Syllabus the following "Error," held by our people but herein condemned:

> XLVII. That the best theory of civil society requires that popular schools open to the children of all classes, and, generally, all public institutes intended for instruction in letters and philosophy, and for conducting the education of the young, should be freed from all ecclesiastical authority, government and interference, and should be fully subject to the civil and political power, in conformity with the will of rulers and the prevalent opinions of the age. (*Populares scholae, quæ patent omnibus cujusque ex populo classis pueris*).

And one more Error condemned:

> XLVIII. That the system of instructing youth which consists in separating it from the Catholic faith and from the power of the Church, and in teaching exclusively, or at least primarily, the knowledge of natural things, and the earthly ends of social life alone, may be approved by Catholics.

It would be easy to add to these three points in which our form of government is formally condemned by the Vatican. One, which it is enough simply to mention, is that it claims the right to fix the laws of marriage, which the Catholic Church claims for itself. (See "Syllabus" LXVII, LXVIII, LXXIII, LXXIV). On this, and on unsectarian education, the Church keeps up a more or less persistent conflict, while on others it remains passive, "tolerating" what it has condemned. To tolerate is much, and a multitude of American Catholics, even of the highest ecclesiastical rank, go so far as to rejoice in separation of Church and State, and believe fully in the right of the people to rule. Many, especially of the laity, are satisfied with our public school system. There is not half so much difference in practice as there is in theory, and theory is steadily following approved practice. Catholics are loyal citizens. They look to Rome for religion, not for politics, or political theory.

The Poet-Laureate

Alfred Austin will be remembered—so long as he is remembered—as a gentle soul, whose note was old-fashioned and rural and undisturbing. At its best, his verse may be described in some of his own lines:

> And this time, simple tale in verse as simple,
> Will from its prelude to its close be told,
> As free from artifice as is the dimple
> In childhood's cheek, whereby is age consoled.
> And haply it may soothe some sufferer's lot,
> When noisier notes are husht, and newer ones forgot.

In spite of his contributions to THE INDEPENDENT, Alfred Austin will be forgotten with some of his forerunners as laureate—Pye, Whitehead, Ensden, Kay, Scogon. The men who bore those obscure names drew the same stipend and the same pipes of canary wine (whose flow was estopped less than a century ago) as Skelton and Chaucer, Spenser, Jonson and Dryden. The greatest poet laureates of the nineteenth century were Wordsworth and Tennyson. The official honor conferred upon the second Alfred in no wise raised him to the other's rank, or gave him the fame of Swinburne or Kipling—to say nothing of those minor or younger contemporaries, Dobson, Watson, Yeats, Masefield. All but Swinburne, of the poets named, are still living. It is exceedingly unlikely, all the same, that any of them will be named laureate. Alfred Noyes, the young and healthy minded singer of Drake and the Mermaid Tavern, is the poet most often spoken of for the succession. Mr. Noyes has the imperialistic imagination which, along with loyalty and conservatism, are supposed to be the essentials of the post.

Yet why name a successor? The court poet is an anomaly in this age of publishers and public libraries; it smacks of the ancient regime of literary patronage. Like the licenser of plays, the dean and sub-dean of the chapel-royal, the clerk of the closet, the groom of the robes, and the pages of the back stairs, chamber and presence, the poet laureate is under the superintendence of the Lord Chamerlain of the Household. So long ago as the third George's time, the offices of master of the great wardrobe and master of the jewel-house, likewise under the Lord Chamberlain's control, were found obsolete and abolished. What better than that the fifth of the Georges should mercifully permit the outworn laureateship to go by the board in the same way! W. B. Yeats is excluded by reason of his Irish birth; Kipling (if we may believe the London correspondents) by reason of having written the "Barrack Room Ballads," with their affectionate allusion to the Widow of Windsor,

> "with an 'airy grey crown to 'er 'ead."

Let the British Government refrain from nominating some discreet mediocrity to an honor empty save for the annual check it brings in; let it add a poet or two to the King's civil list by way of compensation. For poets undoubtedly do need every kind of encouragement, in spite of Mr. Noyes's assurances to newspaper reporters that he lives very comfortably on the proceeds of his facile verse. Said a stenograher, the other day, to her millionaire employer: "I am going to be married, sir; and I am going to marry a poet." "Dear me," said the millionaire, "then you'll have to leave me, I suppose." "No, sir," said the poet's bride, "but I shall need more pay."

Sic semper poetis.

Charles A. Briggs

The most independent and indefatigable of American biblical scholars, Prof. Charles A. Briggs, died last Sunday, at the age of seventy-two. For forty years he had been Professor of Hebrew and of Biblical Theology in Union Seminary, and in that time he had publisht many books on Old Testament exegesis, Hebrew lexicography, higher criticism and theology. He was never reticent about his views, and was in certain points as frankly conservative as in others he was progressive.

He became a national figure, known to the secular world, when in 1893 the Presbyterian General Assembly convicted him of heresy by a vote of 385 to 116, and removed him from the ministry. But the Presbytery and Synod of New York stood by him, and so did Union Seminary, and the result was that the seminary withdrew from the control of the Presbyterian Church. Only last

month, at the meeting of the Assembly, President Francis Brown somewhat defiantly told the members that it did not care to resume relations.

Dr. Briggs's particular heresy was his higher criticism. In an inaugural address on the change of his chair in the seminary he had said that there were three sources of religious authority—the Bible, the Church and the reason—and he did not appear to rank the Bible superior to the two others. It was to be judged and criticized. During the twenty years that have since elapsed the feeling in the Presbyterian and other Churches has so far been modified that such a trial could hardly be repeated. Professor Briggs joined the Episcopal Church and was ordained deacon and priest in due order. His older years have been given more to conserving the faith than to breaking new paths. Indeed, his last work, just issued, *Fundamental Christian Faith,* is an exposition and defense of the Apostles' Creed and the Nicene Creed; for altho he had declared the Unitarian Martineau quite as worthy a Christian as Spurgeon, he never swerved from his defense of Trinitarianism and the Virgin birth.

Night Riders

The night riders are at work again in the tobacco district of Kentucky. Their purpose is to restrict production and to increase prices by threats, the destruction of property, and even murder.

It will be recalled that such was the action of night riders there a few years ago, when farmers who would not obey the commands of an association or combination of other farmers engaged in the production of tobacco, were persecuted by bands of masked horsemen; that barns and dwelling houses were burned; that men were whipt, and even shot in the presence of their wives and children. There were prosecutions for violation of the Federal anti-trust law, and men were punished for this unlawful restraint of trade.

If President Wilson should sign the Sundry Civil Appropriation bill there could be no Federal prosecution of night-rider agents of a tobacco growers' combination. That bill forbids the use of any of the money appropriated for the Department of Justice in enforcing the Anti-Trust law against associations or combinations of agriculturists. It has been said, apparently with authority, that Mr. Wilson intended to give this bill his approval. We do not yet believe that he will do this.

And now in the mining regions of West Virginia a number of workers have been indicted for combination in violation of the Sherman law, much to the surprise, it is said, of the Attorney-General's department at Washington. It would be rash at this moment to approve or disapprove, but it is clear that combination in restraint of trade is criminal under law, whatever its nature, whether of night riders in Kentucky, mine workers in West Virginia, or mill owners in New Jersey.

Japanese Incompatibility

There is no more competent witness in Japan than the veteran American missionary, Dr. D. C. Greene, whose letters we have often published. In a late letter he speaks incidentally of Japanese "incompatibility," and continues:

> Lafcadio Hearn did immense harm by his books. Supported by his statements, opponents of Japanese immigration maintain that even to the third generation Japanese will be incapable of assimilation. It is *bosh.* I do not mean to be too strong, but I cannot think of any more suitable word than *bosh.* That theory is like an old theory of my boyhood that cedar posts would last forever. It was said the experiment had been frequently tried.
>
> After more than forty-three years' intercourse with the Japanese, and on the whole much more intimate than Hearn's, as well as incomparably wider, I am prepared to say that, given reasonably kind treatment, they will assimilate quickly and prove as patriotic Americans as they have been Japanese.

Dr. Greene also tells us:

> I do not think I am an alarmist, but it does seem to me that the California legislature has been playing with fire. We Americans have been doing our best to allay the excitement, and I think we have done good; but it has been discouraging business because of the appeal to race feeling.

Japanese, he says, can understand objections to the admission of aliens who undersell labor, and would acquiesce in any reasonable arrangement which does not imply racial inferiority and incompatibility.

Old Home Week

This year, probably more than any previous one, has seen the celebration of Old Home Week in cities, towns and villages across the whole country. Since its beginning, not many years ago, the custom has made rapid strides. Starting from a tentative reunion of those born and brought up together, it has become a matter-of-course occasion of the midsummer season, with customs and methods already firmly establishing themselves. In theory, Old Home Week has never been equaled by any other public festival time in this country. Its underlying idea is an ideal as well—of old scenes revisited, old comrades reunited, old moods and aspirations summoned out of the past. There is a sort of poetry of beauty and simplicity in the conception of the old generations and the new gathered, as it were, round the hearthstones of their common town.

With keen regard, therefore, it must be admitted that the very zeal in carrying out this Old Home Week idea has resulted, in many places, in a celebration ill-adapted to the needs of the moment. Observe certain specific details. First of all, a rough program is blocked out which necessitates the raising of a considerable sum of money. Bands are engaged, endless bunting purchased, and parading costumes hired. As a result the town is placed under a preliminary burden of expense. The program for the week begins to take shape, gradually becoming more and more crowded. There are parades of decorated vehicles for the forenoons; ball games, field sports and speechmaking galore for the afternoons; and for the evenings—receptions, concerts, amateur theatricals, and other events that could not be crowded into the day. As an inducement to attract people to its Old Home Week, one city scattered broadcast the allurement: "*There will be something doing every minute.*" This has come to epitomize the spirit of too many such celebrations. Under such a system the week becomes a cycle of crowds, bands, red fire and speechifying.

All this is very fine for the small boy who lives in the town. But what about the long-absent native son who has come back to refresh himself with the scenes and the friends of his boyhood? He has contrived to get the time away from the throbbing metropolitan cañons where he works nowadays. He anticipates a week of complete relaxation. As he rolls into the little town—on the stage which has been resuscitated for the occasion (and covered with bunting)—the first thing he hears is the blare of a brass band. And as he seeks out with his eye, one by one, the school-house, the church, the post-office, the old pump, the general store—he finds each top-heavy with bunting. In fact the whole town is so swathed in decorations as to be well-nigh unrecognizable. During the week that follows he is crammed with food at all hours and hauled about from place to place, from event to event. He finds it difficult to get away by himself to visit the "Tipping Rock," the "Devil's Den," the school-house, the old swimming-hole, and the spots of tender associations at which cynics scoff but which the manliest men cherish in their hearts. Good as it is to see old friends, and cordial as the townsfolk are, he finds the whole town a bit unnatural, till it is with a sense not unlike relief that he takes his leave at the end of the week.

The town has insisted upon celebrating in its way, and has had its gala week. It is left with much bunting and a large deficit on its hands. This state of things is by no means universal. But it has become so common that it needs thought. The place which is to celebrate Old Home Week should bear in mind that the week is not intended primarily for the edification of the town itself, but for the returning sons and daughters who long most of all to find the place just as they knew and loved it.

In Brief

Since Schoolmaster Wilson fell upstairs out of the headship of Princeton University into the Governorship of New Jersey, and then fell up again into the Presidency of the United States, it is not strange that it should occur to people that other university presidents might suffer a similar fall. Accordingly when Columbia University gave Senator Sutherland, last week, the degree of doctor of laws he answered back by suggesting that President Butler would make a good candidate to succeed Wilson as

President of the United States. University presidents have been made ambassadors, and the new precedent is not a bad one to match.

It is to be noticed, not for approval, that two or three of our magazines are purposely and confessedly seeking stories which are not fit to be read aloud or to one's self, and which cater to low thoughts of men and women. One such, we observe, actually asks writers to send to it stories which other magazines of "old maid" nicety, governed by "a timid and puritanical policy," have rejected for reason, for it wants what is "unconventional." It has foregone "pandering to the pieties and bourgeois beliefs of the primitive-minded reader." Here is frankness.

"And how then was the Devil drest?
Oh he was in his Sunday best;
His coat was red, and his breeches were blue,
And there was a hole where his tail came thru."

The purpose is good, but the Pennsylvania law is bad, which requires that ten verses of the Bible shall be read by the teacher every day in the public schools. The purpose is religious, and religion is good; but in this free country, where every one may equally enjoy his own religion, the state has no right to pick out one religion, Protestant, and teach that in a Bible condemned by the Catholic Church, and by the Jews; for the teachers will read in King James's Version from the New Testament. Let the Church teach religion not the state. We all have our parochial schools to teach religion on Sunday.

"There is no lobby"; "There are lobbyists everywhere"; "The new lobby is not the old lobby"; "This lobbying is quite legitimate"; "It is more pernicious than the old sort"; "A member of Congress is a judge, and no one must approach him after the hearings"; "A Congressman has the right to seek light till the moment of vote"—these are the contradictory opinions of those who know most; and we gather that the question is, What is a lobbyist? Has the Indian Rights Association the right to keep a paid man in Washington to protect Indians against evil legislation? Is he just a lobbyist?

One cannot but feel a sympathy for President Wilson and Secretary of State Bryan in their correspondence with the Japanese Ambassador Chinda. They are in the condition of a lawyer who has a bad case and knows it, or of a mother whose naughty boy has thrown stones and who is trying to placate the parent of the injured child. The best she can do is to say she is sorry, that it was wrong, and then try to find some excuse for her boy's passion.

Why should not rural districts have as long school terms as do the cities? asks Dr. Claxton, United States Commissioner of Education. All schools ought to have a full nine months' term, and yet Rhode Island and Connecticut are the only states that give it to rural schools. On the other hand, North Carolina, South Carolina and New Mexico give country children barely four and a half months of schooling every year.

They had a spelling bee last Thursday in Washington between fourteen newspaper men and as many members of the Senate and House, and the latter won in the person of Congressman Willis, of Ohio. There is no better fun, for it is pure, arbitrary memory against sense and reason. Think of the absurdity of the spelling of *bdellium* which put out Congressman Willis's last rival.

We most sincerely trust that the late revival of moral sense in California on the subject of social crime will keep the coming Panama Exposition to be held in San Francisco free from such a riot of commercialized vice as has disgraced some former expositions. It is a matter for the state and city authorities to keep in mind, as well as the directors of the exposition.

Notwithstanding Smith does not go to church and takes no interest in work for the public good, eighty young men and women are commissioned as new foreign missionaries by the Presbyterian and Reformed Churches and are in conference in this city this week. The good work goes on without Smith.

The New York City Board of Estimate has voted to allow in Manhattan the building by the city of two not expensive plants to make ice for city use and for sale at cost. That seems to be legitimate. Borough President McAneny says the city cannot conviently create beef for city use, but it can make ice.

Cardinal Vives y Tuto's condition is tragical. He is reported a raving maniac, with the idea that he is Pope, and he gives orders to exterminate all Modernists. He is a Spaniard, and has been a bitter enemy of the Modernist movement. This ends his chance to be the next Pope.

Why Did We Fight in 1812?

The Causes and Significance of Our Last War with Great Britain

By C. H. Van Tyne, Ph.D.

[A hundred years ago American shipping was being attacked by British men of war and Canada was invaded by American troops. Some of the spectacular events of this war are well enough remembered, but what it was all about is not sufficiently understood, so we have asked the head of the Department of History at the University of Michigan to tell how the war of 1812 appears to the historian of the present day. Professor Van Tyne is the author of a *History of the American Revolution*, a *History of the Loyalists in the American Revolution*, a *History of the United States* (with McLaughlin), a *Guide to the United States Archives* (with Leland) and editor of the *Letters of Daniel Webster*.—EDITOR.]

A century ago we were at war with Great Britain, and the struggle did not yield much glory for either nation, but a centenary is upon us, and the historical mind insists upon reverting to that rather inglorious strife. We have come to understand the subject better, however, as a result of the exhaustive investigations of Henry Adams,[1] and the philosophic interpretations of Captain Mahan,[2] so that the thought of the conduct of England no longer moves us to wrath. We see world forces, and the dominant theories of an age, as causes of the war, instead of the mere jealousy and meanness of a rival nation, as our forefathers believed.

The war of the American Revolution was hardly over before the clouds began to gather which were ultimately to break in the storm of 1812. The peace of 1783 left England unchanged in its pet theories of commerce, which had led, in colonial days, to the navigation acts and other laws which had alienated the thirteen colonies. Peace had only restored to action the old conditions which war had for a time destroyed. No longer having political domination over the American states, the British government sought other ways of controlling their commerce. Adam Smith had undermined, but not overthrown, the mercantile theory, which for an age had ruled not only English, but all European thought on colonial matters. England had, perhaps, learned something from the American Revolution as to the political treatment of colonies, but she had gained no breadth of view as to the nature of the economic use of colonies to the home country. After 1783, she attempted to apply the same theories to her trade relations with her colonies in the West Indies, as were before applied to the American continental colonies. If, reasoned the conservative English statesmen, the Americans were to trade freely in the West Indies, their trade would grow and England's would wane. British seamen would go into the American service, and, in a word, the British merchant marine would lose both in men and tonnage. Some check must be found. America must be subjected to the welfare of British commerce. In the Confederation period, therefore, as a result of the belief that the weak American states could not act together for their commercial interests, the policy was adopted by the British government of excluding the United States wholly from the carrying trade of the British colonies, and even from sending thither the absolutely necessary supplies. This conduct ignored what the wise British statesmen had long held, that if friendly relations could be maintained with America, trade with her as an independent country would be quite as valuable as the old trade with subject colonies. But an age-long fallacy would not down; upon the scars of the recent war England laid the lash of commercial oppression.

Added to the damage which this policy did to American trade was a suspicion, not unfounded, that the motive was not mere desire for gain. John Adams, writing from London, 1785, said: The British object "is not so much the increase of their own wealth, ships, or sailors, as the diminution of ours. A jealousy of our naval power is the true motive, the real passion which actuates

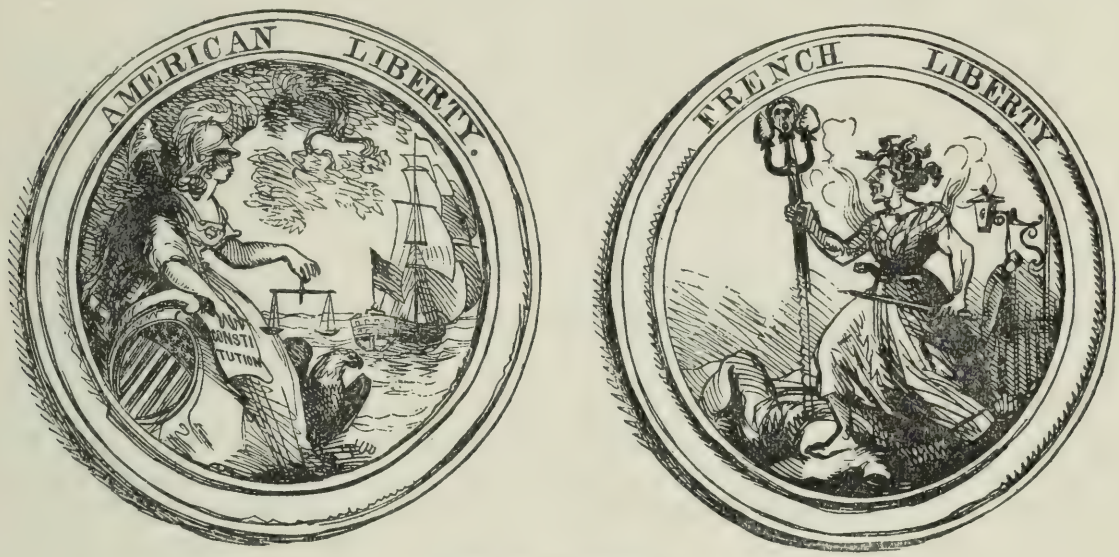
them. They consider the United States as their rival, and the most dangerous rival they have. . . . they are less afraid of the augmentation of French ships and sailors than American."



But more significant, as one of the fundamental causes of the War of 1812, was the lack of respect on the part of all foreign nations for the new United States of America, which most contemporary Europeans looked upon as the protegé of France, indebted to her and to her allies for their independence. Hardly was the treaty of peace signed before France turned the cold shoulder upon her impecunious ally, which still begged for financial aid. France, too, granted but grudingly to the Yankee shippers a trade with her West Indian colonies, which indeed was permitted only in sixty-ton vessels, so that fear of venturing across the Atlantic would confine the privilege to direct trade between America and the West Indies, When the French Revolution broke out, Republican France insolently demanded aid from the Americans as in keeping with the obligations of 1778. Citizen Genet was sent to America with power to issue letters of marque and reprisal to American privateers, and when Washington coolly issued a proclamation of neutrality, and refused to accede to Genet's demands, the zealous Frenchman threatened to hale the father of his country before the Supreme Court. Later, the French government, angered by Jay's treaty with England, refused to receive our minister Pinckney, a Federalist, suspected of being pro-British. When a new embassy, Gerry, Marshall and Pinckney, was sent, it was insulted by a request from three mysterious Frenchmen for a bribe with which to open the way to negotiations with Talleyrand, the French minister. This X. Y. Z. affair, as it was called, and the seizure of American ships in French ports, led to a *quasi* war with France, to which the advent of Napoleon put an end. In 1796, the French were so audacious in their efforts to overthrow English influence in the American government that their representatives took part in the political campaign to defeat Adams, who had British sympathies, and to elect Jefferson, regarded as a "Gallomaniac." French flags and French cockades were displayed, and Adet, the French minister, acted as if he thought America a province of France.

Spain, too, was contemptuous, and only because of the fear that the Jay treaty (1794) might mean an alliance between the United States and England—because in a word she feared British control of the sea—was she brought, in 1795, to settle a twelve year dispute over our southern boundary, and to yield free navigation of the Mississippi to our western settlers. Indeed, Spain, France and England schemed up to 1803 to get possession of the Mississippi valley, as if the United States, whose very future depended upon its ownership, did not exist. Spain took into her pay the western leaders, like Sevier and George Rogers Clark, and corrupted everybody there who might help to bring the settlers of Kentucky and Tennessee under Spanish influence. Even the Louisiana Purchase was perhaps made possible because of Napoleon's contempt for the Americans, from whom he seems to have thought that he could retake Louisiana when later his hands should be freed.

England's contempt for her former colonies was shown from the day of the treaty of peace by her refusal to carry out the very terms of that treaty as to the surrender of posts in the Northwest, the giving up of the negroes carried off by her retiring armies, and as to certain matters of trade. All of this foreign contempt would pass away only when the United States by some signal manifestation of resentment should prove to the nations that she had national pride, and —what was more important—power.

When the French Revolution ran its course until nearly all the nations of Europe were involved, the United States was left almost the only neutral, and the warring nations, in their efforts to crush each other, paid little heed to the rights of neutrals. England tried to starve France and, despite America's neutral interests, applied the "Rule of 1756," which declared that no neutral could enjoy in time of war a trade between a belligerent and her colonies which that country had denied the neutral in times of peace; in a word, that the United States could not serve as a cat's paw to

rake the trade chestnuts out of the West India islands for France whose own vessels could not carry on that trade. America protested, and for a time thereafter England allowed the trade, but when after 1803 the war with Napoleon grew more furious, and when Nile and Trafalgar had demonstrated that Britannia really did rule the waves, the trade was forbidden again. Yankee traders were excluded from all the harbors of France or her allies. Neutral ships complying with British law were denationalized, and made lawful prize. All British goods seized were to be confiscated and burnt. Acceptance of these decrees by other European nations became the condition of Napoleon's friendship, while refusal was regarded by him as a reason for war. By 1808, Spain, Naples, Hol-

THE CONTRAST.

A print circulated in America after the Reign of Terror. The "Democratic Societies," which imitated the Jacobin Clubs in France, endeavored to create the impression that the French Revolution deserved from Americans the same loyal support as their own.

then tried to evade the restriction by sailing from the West Indies to American ports, getting new papers there, and sailing to France—the "broken voyage" as the plan was called. An English pamphleteer pointed out that this trade was merely "war in disguise," and soon the British admiralty courts began to decide that the "broken voyage" could not save vessels from seizure. When Madison, delighting more in words than in deeds, tried to overthrow the British government with arguments against this interpretation of the rule, he learned the folly which Pompey pointed out in his famous dictum "Will you never have done with citing laws and privileges to men who wear swords?"

But American neutral commerce had only begun to suffer. Napoleon embarked upon a plan of conquering the sea by the land. A series of decrees, of which the Berlin (November, 1806), and the Milan (December, 1807), decrees are the most famous, declared the British Isles in a state of perpetual blockade. British ships

land, Austria, Prussia, Denmark, and Russia had acceded and closed their ports. England by a series of "Orders in Council" declared the coasts of France and her allies in a state of blockade, with the result that the whole coast-line of Europe was sealed up. France with the whole Continent behind her would suffer no lack of the necessaries of life, and England with all the other countries of the world within reach of her merchant marine, could live independent of Europe. But neutrals—of which the United States was chief—were the real sufferers.

France could enforce her decrees only by seizing American vessels which ventured into her ports, but British vessels, ranging all the seas, claiming the "right of search," stopped all Yankee ships, and sent on board an officer who insisted on seeing the sailing papers and even the cargo if necessary. Tho the United States government denied this right, it used nothing but diplomatic argument, because Jefferson's policy of economy had reduced the navy to little more than a

collection of gunboats, which he planned could be hauled up on land, and protected from rain and sun in sheds. They were, said the British press, "bundles of pine boards sailing under a bit of striped bunting." The British vessels therefore, fearing nothing, stood off our great seaports, and searched any Yankee boats suspected of violating the Orders in Council.

Not only did they search each vessel, but, if sailors were found on board who were suspected of having been born in England, even tho they had come to America and had perhaps been naturalized, they were imprest into the service of the British vessel. England claimed this right as a logical consequence of her doctrine, "Once an Englishman, always an Englishman." All nations then held the doctrine of "indefeasible allegiance," but the United States from the colonial days on had been opposed to the doctrine because the new world was rich in cheap and fertile land but poor in labor, and every device was resorted to in order to make it easy for Europeans to immigrate. Naturalization was made easy, and from the earliest days of our national existence to the present, the United States has been the champion of the right of a German, Frenchman or Englishman to put off his allegiance to his native country and to become an American citizen. From the English point of view, there was a real grievance in the fact that thousands of British sailors, in the time of Britain's greatest need, had left the harsh service and poor pay of the British navy, for the easier service and better pay of the American merchant marine. Thousands of British sailors with forged papers were sailing in American ships with the connivance of American captains, but the grievance should have been settled by judicious diplomats, rather than by ignorant, ill-tempered sea-captains on ship decks where might makes right. It was to be expected that the matter would end in that crowning insult, when the British ship, the Leopard, overhauled and fired upon the Chesapeake, an American man-of-war, and took off four British sailors, killing several Americans.

Even this disgraceful affair did not force the Americans into warlike reprisal. As the English press tauntingly said, "spaniel-like," they "could not be kicked into war." Instead of war, Jefferson proposed to fight England "with philosophy and hunger." He proposed an embargo, bottling up our own shipping, and keeping out of our ports the ships of all other nations. Non-importation the country had tried before, but such a measure as this was without parallel even in the tales of fiction, except in *Gulliver's Travels*, wherein the Lilliputian king declares an embargo. Wild as this expedient was, Congress passed it as at a Sultan's command. Thereafter, for a time, much of the longshore trade was carried by "ox-marines," as they were called, and the rhymester's sneer was realized.

"Columbia needs no wooden walls, no ships where billows swell,
Her march is like the terrapin's, her home is in her shell."

New England was especially hard hit by this measure, for the sea was her farm. Some of her leaders threatened nullification, and the very Union seemed endangered.

To this pass had the United States come, because its political leaders had not heeded the wisdom of Gouverneur Morris, who wrote early in the struggle urging the building of twenty ships of the line and a due proportion of frigates. "And I am tolerably certain," he said, "that while the United States of America pursue a just and liberal conduct, with 20 sail-of-the-line at sea, no nation on earth will dare to insult them . . . five years of war would involve more national expense than the support of a navy for twenty years." If we don't do this, we shall continue to be insulted, he added. Captain Mahan thinks that if we had had twenty ships of the line in 1800, we should have had no war of 1812—Jefferson's passion for peace, and abhorrence of navies, being left out of account. Instead of such a program, the genial philosopher was listening with approval to such arguments as this: "Carthage, Rome, Venice, Genoa were republics with free institutions and great navies; Carthage, Rome, Venice and Genoa lost their liberties, and their national existence. Clearly, navies, besides being costly, are fatal to constitutional freedom."

Tying commerce "to Jefferson's apron

strings" failed to accomplish the desired end, and, in 1809, under Madison's administration, the embargo was repealed, and non-intercourse with England and France was substituted. It gradually became apparent that America must fight either England, "the den of pirates," or

JOHN BULL TAKING A LUNCH

The caricaturist, Gilroy, thus pictured the triumphs of the British fleet over the French in the autumn of 1798. The lunch consists of French frigates.

France, the "den of thieves," and to determine which Congress passed the Macon bill, No. 2 (May 1, 1810). Intercourse was renewed with both England and France but, if either put a stop to the seizure of American vessels, Congress would declare non-intercourse with the other. Napoleon cleverly deceived Madison into the belief that the decrees were repealed—tho in fact they were not—and at the President's request, Congress declared non-intercourse with England.

When Madison's administration began, there was not half the reason for war with England that there had been in 1806, and Madison, well suited to the piping times of peace, was no war god, but there came into Congress in the next two years young men out of the virile west who became known as "Young Republicans," like Troup, Sevier and Grundy, a vigorous trio, bound to sing a war song. Under the eager leadership of Clay, these frontiersmen began to demand war. Frederick J. Turner has shown how the western people, separated from European influence by the Allegheny barrier, felt the first impulses of true Americanism. The seaboard commercial people seemed to have lost all adequate sense of national pride, but the West with no commerce to be endangered by foreign war, safe in the almost pathless interior from the peril of invasion, was of a temper to meet national insult with instant challenge. These men now controlled the government which earlier had neglected them, and they were eager for war. Andrew Jackson, six months before the war broke out, wrote the government of Tennessee that "with ten days' notice he could take the field at the head of 4000 men" and "within ninety days be before Quebec with 2500." In fact, one week after war was declared he offered the President 2500 volunteers burning "with anxiety to learn on what theater their arms would find employment."

As matters got little better, Madison was at last induced to send a belligerent message to Congress. The spirit of revenge and the hope of the conquest of Canada carried the war party to success. In a vote in which western influence was almost solidly for war, Great Britain was declared to be our open enemy. Thus war was finally declared, says Babcock, when there seemed no other excuse for it than to wipe out the disgrace of a long and spiritless inactivity. Madison, speaking very big when absolutely driven to war, wrote, "To have shrunk from resistance, under such circumstances, would have acknowledged that, on the element which forms three-quarters of the globe which we inhabit, and where all independent nations have equal common rights, the American people were not an independent people, but colonists and vassals." Yet to make war on England was in fact to ally with Napoleon, her implacable enemy, and the world beheld the strange alliance of James Madison, lover of peace, and Napoleon Bonaparte, the genius of war. It would have been quite as well perhaps to have declared war on France, for the essential things gained were self-respect and the respect of other nations. The war made the world think of the United States as a nation able to stand alone. And the American people faced about, and no longer peered beyond the sea, eager only to know what England and France were doing. It is these results which give the warrant for calling the struggle "the Second War of Independence."

Ann Arbor, Mich.

On the Charm of College in Summer

By Frederick M. Smith

They pity me a little, I imagine—my friends who fly to Europe or the northern lakes, leaving me to what they think is the desert dullness of summer in a college town. And I laugh to myself, for I have come to prefer college in summer to any other time. In a sense it is deserted, but it is never dull. There are no squads of young gentlemen parading the streets to the accompaniment of tin-horn clamor and class yells. There are no gory conflicts on the football field, with bonfires and inebriation to follow. In fact, college in summer approaches nearly that Utopia which harassed professors occasionally sigh for—an educational institution without students! True, there are a few summer "thirsters," but they are unobtrusive and innocuous, too much obsessed by a desire for culture to make their presence wantonly felt. For me there is merely the big quiet library full of books, the birds in the maples, and the bells in the clock tower. My happy business is to work a little, to loaf, to invite my soul, to cultivate my garden of leisure.

I am quite alone in the great stone chapter-house where I live, and from its wide piazza I have a picture which makes for my contentment. Off to the East is a long green pasture dotted with fat cattle; to the South a greener meadow, its far edge fringed by clumps of willows, beneath which a brook wanders among grass tufts and beds of mint. Beyond this rises the hill where the college buildings doze among the ancient maples—you glimpse their white walls and red-tiled roofs thru the summer green, and above them all, like a watcher in the skies, is the clock tower. At night the windows shine and the clock face is illumined.

You will see at once why, in such a setting, I am reminded of a certain mellow town of England. Everything suggests it—the fair blue sky patched with low-hung clouds, the tree clusters, the solid Gothic buildings, and, more than all, the chimes which fling their sweetness across the meadow at every hour of the day and night. There is an ancient peace now that we have at no other season. The spirit of the old humanists seems to brood upon the place, and it is easy to fancy one's self in some Oxford close whose yellowish gray stones are as scaly as the old hand of Time.

New as our college is, it has solidity; it has dignity; it has atmosphere. I know that our youngest traveled professors scoff at the architecture of our buildings, but I am prepared to wager that in a hundred years, when Time has hallowed the stones, other travelers will marvel at their architectural beauty. For Time is a wonderful changer of opinions, especially on matters of art.

In such surroundings then I spend my summer. Of course, in these days I sleep out-of-doors, and by great good luck the house is so secluded as to permit my making a bed chamber of the broad piazza at the front. If it rains sometimes that gives just a nice touch of adventure: I can pretend I am at sea, wave-lashed, or in the North woods, with the pines tossing above me and the rain thrashing at my tent. Thus I get some of the zest of travel without its vast discomforts.

In the morning I am wakened by the birds; first a cock's shrill clarion, then the bubble of the martins that nest in the garden-boxes. In the blue air the swifts wheel and rattle; from the pasture comes the shrill spring-note of the meadow-lark; by the brookside a song sparrow sings his matins. A Maryland yellowthroat answers from the willows, a cardinal whistles, a jay squawks; and last there is the comfortable domestic chuckle of the redhead and the rattle of his hammer on some hard bough or iron spout. But every day that we move thru June finds the songs fewer or less cheery; by July the noisy clatter of roosting grackles comes in and the occasional "kow-kow" of the cuckoo.

With birds to waken one and a spread of cool green to meet his opening eyes, who could rise other than happy? My breakfast, too, is a part of the poetry of the morning, for an old negro cook can be depended on to chill the yellow fruit,

to do the egg to a second, and the toast to a turn.

While I am having my after-breakfast pipe on the front piazza I see the figure of one of my colleagues toiling up the hill to meet the seekers after knowledge. He will talk for an hour on the poems of John Milton. Later, when I meet the pink-cheeked young ladies and the sober young men who have heard, I am heretic enough to wonder if they have any living interest in John Milton, whom I suspect them of studying, not because they like him, but because they are getting ready to teach him to somebody else who, in turn, must be prepared to teach—and so *ad infinitum*. At any rate I turn to my own work more cheerfully.

Being a schoolman, I must do my bit of editing and annotating, and so add one more to the innumerable school editions of the classics—pap for the juvenile intellect. This gets my name on the title-page of a book—I have not yet written one of my own, and it brings in a penny; two practical considerations to the poor professor.

This season the work is, *Selections from the Works of Henry Thoreau;* Arranged and Annotated for School and College—a task delightful in itself, since it enables me to live again that inspiriting spring at Walden, to float and philosophize on the Merrimac, and to breathe the ozone of the Maine woods.

Work is for the morning hours. Later in the day I sometimes go over to the library to browse among the old magazines—a fine pasture land sure to yield many sweet herbs and pleasant fruits. Of late I have refreshed my memory of Du Maurier's society sketches, envied Howard Pyle's pirates, confirmed my recollection of the charm of H. C. Bunner's short stories, and been freshened anew by the poetry of Sill.

And only yesterday I spent an afternoon searching out Edwin Abbey's illustrations for old English songs. Could any drawings be fitter? could any songs be sweeter? "The Leather Bottel," "Sally in Our Alley," "Kitty of Coleraine." The very names carry me back in imagination to the days at home when I first heard them. And I think with regret how little these fine old songs are known nowadays. The young people whom my colleague is leading to Milton have never heard of Samuel Lover or Henry Carey; and if by any chance I should take a part in the revels of the young ladies of whom our college is so proud, it is ten to one that I should be regaled with "Bonbon Buddie," "Everybody's Doing It," or "Row, Row, Row," played slambang on a loud piano. It will take one much skilled in the art of persuasion to make me believe that we are not degenerating.

Still, I must be frank and admit that there are modern books with much of the old charm and sweetness. For instance, I have just come upon *The Upton Letters* and find it particularly congenial in my present state. It should be read late of a summer afternoon, when the birds are just beginning their vesper songs; and it should be read within sound of bells. Then there are Mr. Lucas's *Over Bemerton's* and *London Lavender,* quiet volumes both, excellent to dip into before bedtime; full of the spirit of Queen Anne's London; suited to the moods of leisurely gentlemen; soothing but sparkling; full of a gentle, genial humor which is the concomitant of a well-fed mind and body. A book of this same ripe charm, dealing, not with city streets, but with country lanes and roadside characters, is *Lift Luck on Southern Roads.* I came upon it by that chance which so often leads us to friendly books and, I suppose, as often hides them from us. Whoever likes the sweet breath of fields, the songs of birds, the homely philosophy of outdoor folk all set forth in a prose rich and musical, will be glad to be introduced to this volume of Mr. Tickner Edwards.

But one does not always move in a golden haze, even in summer; the mind craves brisker air. I have got this in Lockhart's *Scott,* which I have kept by me this year. Scott was a fine, hearty, outdoor sort of man in spite of his being an artist. He tried first to be a country gentleman; writing came second. He had none of your modern writer's over-developed notion of the importance of his art. He preferred being known as a good farmer to being hailed as the author of *Waverley.* In the Middle Ages the artist was either a mountebank or a servant; in our age he is so petted that one might imagine he was a god. And we are just

as wrong on our side as the Middle Age men were on theirs. Scott had the sense to see art and life in their right relation; he wanted to be a doer as well as a seer. If he had done nothing but bred sheep he would have done little; but if he had not bred sheep would he have been so rare a romancer?

Doubtless I lay stress on Scott's rightness because I realize my own failing. In common with most academicians I see life at long range; for about the world in a college there is always the mist of the unreal. We see visions and dream dreams; we are all for the education and culture that come by books. We exalt the printed word, the theory as against the practice. Dealing entirely with youth, its pleasant and romantic aspirations, we forget that there is some value in mutton. We are always at the source of things, at the place where the water bubbles out of the rock. It is a pretty nook, shady and enchanted, but it is very secluded. We seldom follow the stream till it begins to turn wheels or carry ships.

It would be a fine thing if every man who sets up to teach the humanities should first be required to serve a year at the world's work—at a trade, in business—earning his living in actual contact with *men*. So would he be a better teacher and a leader. In our best professional schools we ask the students of law or mechanics to broaden themselves by some attention to the humanities. Why not apply the same sauce to the gander and ask all our professors of the humanities to liberalize their education by a knowledge of the real workaday world?

"The profession of teaching"—as one of my friends said in his haste—"the profession of teaching is no job for a full-blooded man."

Perhaps that is true, and I ticket myself when I acknowledge that another of my summer pleasures is reading Borrow. I am an adventurous soul, but like a true college professor I prefer my most perilous adventures second hand. With Lavengro I can "go it" to my heart's content. Without a tremor I wander on lone heaths with black-visaged gypsy folk; I sleep under hedges with no thought of rheumatism; knock the heads of gentlemen whom I dislike, careless of consequences; and consort with splendid Amazons unplagued by gossip. A great man, Borrow, and a godsend to us timorous individuals who are soft with civilization. Borrow is an appetizer before supper. Then in the early twilight I sit and smoke my pipe, complacently believing that if Mr. Petulengro were to come along at that moment I would be equal to meeting him on even terms in a horse trade.

The dark comes or perhaps the faint silver of the moon; and the mood changes. It is one of gentle melancholy, of retrospect. I have said that in our profession we deal wholly with youth; and here I put my finger on a thing that saddens. In no place so much as in a college does friendship seem so unstable. The procession on its way to camp in the fields of the real world leaves us sitting fast at home on the steps of the cottage. Where are the youths we played with as students, and those we grew to love even as we taught? One roommate writes me from the Kongo jungles; another edits a paper in Manila; others less spectacular are country surveyors, or patent lawyers, or prosperous hardware merchants; and I am still dealing with boys and girls. Every year you welcome them, these eager men and these wonder-eyed women; and before you know it they have waved a hand to you and are off over the hill. You form attachments only to have them broken; they are unstable as water. True, there is a touch of pride in hearing of their successes, but there is a twinge of melancholy, too.

And so on these moonlit nights, as I sit listening to the chimes and tasting the pungent odor of the rank weeds that grow in the meadow, I find myself in a mood of solitude, dreaming of the old faces; like Moore,

> I feel like one
> Who treads alone
> Some banquet hall, deserted;
> Whose lights are fled,
> Whose garlands dead,
> And all but he departed.

But when the first meadow lark whistles at the dawn, and the first shaft of sunlight touches the red tiles of the clock tower, I am renewed. There is another day of reading, and of thinking, and of dreams.

How to Make a Social Survey

Practical Directions for Mapping a Rural or Village Community

By James F. Jenkins

[The first step in the development of community life is to determine the constituents of the community; to map the field before beginning the campaign. Just how to go about this is explained in the following article, so that any one can undertake the study of his own town or country in a systematic manner. After a survey has discovered the good and bad points of the social conditions in a community then proper measures may be taken to bring all of the people together and to make country living more attractive thru the cultivation of common interests.—EDITOR.]

In the good old days of the country singing school and the husking bee, when every farmer knew every other farmer for miles around, it was an easy matter to get the residents of a rural community together for sociable times, for mutual benefit organizations or for school entertainments. In those days social classes were much less sharply divided. There were fewer nationalities and people were in general fairly well to do.

But at the present time conditions are quite different. Amos and Josiah and Lizzie Ann have drifted into the city—one to become a bank president, the other a manufacturer, while Lizzie Ann is a school teacher in a ward school. The country has received its share of the great influx of foreigners from over the seas. Germans and Norwegians have settled the western lands and are becoming the pioneers of the future. In parts of New England, the Italians and Portuguese have taken up truck farming. In many school districts in the Middle West one may find as many as ten nationalities. The problem of getting these various peoples together in a common meeting place, for the sake of developing the qualities of American citizenship, presents as many or more difficulties as it does in the social center in the city.

To pick up the scattered social threads of the present rural community life and to weave them into a strong and fine social fabric is the purpose of the social survey with which this article deals.

In every farming community there are some intelligent persons who recognize the lack of sociability and organization in their group and who would be glad to undertake a social survey or inventory of what social conditions already exist and to study how the present social conditions can be improved. For it is only in making the country home less of a camp that the rural districts can hope to save their boys and girls from the lure of the city. The plans given in this article for making a social survey are those devised by Mr. C. J. Galpin, of the College of Agriculture of the University of Wisconsin.

The first move is to take stock of what social agencies already exist in the life of each community. Of such agencies there will be found from ten to forty different organizations in every rural community: schools, churches, Sunday schools, a library, lodges, a breeders' association, band, baseball clubs, and even, perhaps, a literary society or club. Each one of these clubs or organizations is a piece of social machinery which brings the power of a number of local people to bear at once upon a common interest, and thus brings about results impossible to the efforts of any individual. So a census of the permanent organizations in the community will show what interests are deemed important and also how far this community has succeeded in making local life worth the living.

Thus it is readily seen that a social survey is an attempt to show, as if by a photograph, the interrelations of all the homes in the community. A glance at such a community photograph will discover what lines there are of strong, wholesome association, and at the same time show up the weak links in the social chain. Only from a communal knowledge of the social facts brought to light in this manner can an intelligent improvement plan be built up.

The first step in making the survey is to locate your rural community and to draw its boundary lines. Begin at the village center and go westward into the

open country. The first farmhouse you come to outside the village belongs to this community, because its household goes to this community for trade, high school, church, doctor, the Swiss bell-ringers and the lyceum lectures. In this same community may likewise be reckoned the second house westward, the third, the fourth, and so on until you come to a home that looks to another village for its source of supply. This home does not belong to your community. It marks the frontier of your community in that direction. Now fix this frontier by connecting with a line all these farthest outlying farms that belong to your village community.

Next, take a census of every farm and village home within this circuit. The College of Agriculture, University of Wisconsin, furnishes "rural home census" blanks for this part of the work. Armed with these blanks, let some careful person visit every house. Some one in the home will gladly give the information needed to fill one out, for every fact asked for is a thing of some pride as furthering public knowledge.

Let the census-taker include every man, woman and child in the family, not leaving out any hired man or other person belonging to the household. Let him be sure of his facts, and put them carefully and plainly in their right places on the census sheet. Thereon depends the value of his census.

Following this survey comes the organization census. The same university furnishes census sheets, one of which should be used for every organization in the community. Your social surveyor will include every school, from the consolidated township high school down to the little red schoolhouse on the creek, every church and Sunday school and every society which holds its meetings in the church; such as brotherhoods, young peoples' societies, ladies' aid societies, mission clubs, etc. He will include every fraternal order, every lodge, club, or association whatsoever, such as a band, singing-school or baseball club. No group should be omitted that have a name and regular meetings. A courteous request to the secretary of each organization will undoubtedly elicit all the facts desired. The value of such a list is measured by its accuracy.

After this work is ended, comes that of making community maps. These are needed to fill out the information got by the home census. A system of community maps, helping the eye, make the census facts far more useful in showing up local conditions. Words by themselves cannot make the situation clear. Everything has to be surveyed and mapped nowadays. A map should now be drawn of your community on white cardboard or cloth-backed paper forty inches by thirty-six. Put in all the roads and the radial limits of the village. Locate every farm home on this map by a round black dot a quarter of an inch in diameter. Make a separate map of the village, locating all homes by the same black dots as you used for the farms.

Now you come to the total socialization map. From the organization census make a list of all the organizations in the community. Put each organization on the map in a different color. Then, out of colored paper, of these same colors, make little round seals of the same size as the dots. Then of the farm home census take one sheet at a time and see what organizations are represented in each home. To show the connection which one or more members of the home have with any organization, stick one seal of the right color to the edge of the black dot locating the home. Keep on thus until you have a line of seals of different colors on the map which shows at a glance just what organizations are represented in the home. Treat each farm in the same way and the resulting community map will show as a whole all the social connections of the homes outside the village. Make the village map the same way and the two maps side by side will show the total social relations of all the homes in the community.

A "tenant and owner" map can be made by fixing to the map seals of one color for tenants and seals of another color for owners occupying each farm. At a glance you will see the situation of the tenant problem—the proportion of landlords and tenants.

A "school" map will show the number of homes having some children of graded

school age not in school, along with those homes where such children are all in school. In the same manner you can make a map showing in how far the homes make use of the high school.

A "Sunday school" map will indicate for you which homes have children going to school but not to Sunday school and which have children all going to Sunday school.

Other possible maps are: one showing in how many homes newspapers circulate, one showing into how many homes newspapers find their way, one showing the yearly round of community festivals and other events, one showing how many homes use the village library, one which will indicate the homes with and without children. Also the proportion of foreign-born residents and the percentage of hired help may each be indicated on maps.

Then, too, several of these maps can be combined into a valuable one setting forth the relation of one set of facts with another set. For instance, a yellow seal may show how many families have lived in the community at least five years. Give a red seal to church membership of any denomination whatsoever. Then combine these two sets of seals in one map. Such a combination map will show whether churches have been making their normal appeal to the later comers in the community. A score or more of such important combination maps are possible which will prove of great help to the interested surveyor, be he or she farmer, doctor, social worker, teacher, or church worker or priest.

Make a table of all the organizations in your community. Follow the divisions called for in the organization census sheet, including the value of equipment and annual expenses, putting the total number of members instead of the actual membership list.

Well may every one ask: What is the use of such a social survey? It is only by thus taking stock of all the important social activities of the community that you can show everybody therein just what share every home bears in the social life.

In the first place this survey will lay bare how many homes are socially isolated thru neglect, oversight, indifference, or rustic prejudice. This disclosure is a diagnosis, without which no public-spirited citizen or organization can know what remedy to apply or where to apply it. It will be useful to every citizen seeking a wider social acquaintance and to every organization seeking to arouse interest in community enterprises.

The disclosures that follow the study of these maps will set tongues wagging. "Why is not Hank Billings in the Breeders' Association?" "Why are there no women south of the river in the woman's club?" "Why don't the folks up in the northeast corner of the district use the village library?" "Why are there so few children of high school age in the village high school?" Such questions as these strike at the root of what causes much social hardship in outlying rural districts.

This inventory affords the necessary

THE TOTAL SOCIALIZATION MAP

The line of symbols attached to each home shows the organizations represented in the family. A symbol is repeated where different organizations of the same kind are represented, but only one symbol is given for any number of persons in the family belonging to one organization. The area within the dotted line is the village, charted on a separate map.

outlook over all the social connections of all the homes—an outlook from the point of view of the whole community. Herein lies its utmost value. The maps are as community photographs, and no mind can escape their humanizing lesson.

How does the social situation thus revealed affect the whole community? In the light of the situation here shown, how can we make each association help further the interests of the entire community?

With an organization table before us further pertinent questions will arise. "How can all these important 'social machines' be made to unite their forces for the betterment of the whole community?" "Can a united social front be presented when occasion demands it?"

The survey will make it plain that some important interest of the community has no "social machine"—no means of explaining itself socially—at work in its behalf. Here then, will be a chance to introduce a new force in behalf of a well-rounded and wholesome country life.

If the survey gives rise to agitation resulting in a readjustment of social conditions to meet the larger needs of the community as a whole, it has more than justified its making.

Who shall make the survey? Any group of public spirited persons, with sympathies as large as a community, can undertake this interesting task. The survey should be organized with one person at the head. The staff of five to ten tactful people will suffice to take the home census. Materials for the survey may be obtained from the College of Agriculture of the University of Wisconsin at a minimum cost. These materials include rural organization census blanks, 10 by 15 inches in size; paper for maps and charts and colored seals.

The plan has been well tested in Wisconsin, and it works.

Alfred Austin

By H. T. Sudduth

Like low sweet sound of babbling meadow brook
That comes thru silence of long summer noon
To one who lies in beechen shade with book,
While Nature wooes to dreams with sweetest rune

Of birds and rustling leaves and drowsy hum
Of bees in clover in a mead in June—
So thru the years the quiet strains have come
Of Nature's singer with her heart in tune.

He sang the seasons as they come and go,
Their Laureate he in verse and cadence prose,—
Fair English landscapes, loved, in summer glow,—
But best of all his quiet garden close.

What tho he sang no well-remembered song,
And gloom and grandeur of the hights ne'er knew?
What tho he lacked the strength to stir the throng
And make a nation's pulses beat more true,

In onward march with some high purpose grand?
He sang as he was moved and gave his best,
And made more fair his own loved English land
Wherein he now finds peace and dreamless rest.

Shall We Forget Erasmus?

By William Hayes Ward

A contemporary French critic, Remy de Gourmont, recalls us to "An Unknown Literature," that in the Latin language beginning with the time of Augustine and ending with Erasmus. He is not quite right, for Augustine is fairly well known in the translation of his *Confessions,* and so certainly is Thomas à Kempis, author of the *Imitation of Christ.* But as an author of literature Erasmus is very nearly forgotten. Desiré Nisard says of him: "He has written admirable things in a dead language." When he wrote, the patois of the nations had begun to rise into languages of literature, for Dante and Chaucer had chosen to reach the common people in the vulgar tongue; and a hundred years later Milton apologized for writing in English. But Latin was doomed and rightly so. The star of democracy had risen, and the language of scholars and courts must give place to the tongues of the common people.

Of all the scholars to whom the Renaissance must be credited, the chief is Erasmus; and of them all the most erudite, the most versatile and the most lovable, by character as well as by name, is this same Desiderius Erasmus. With the birth of printing he gave us the Greek Testament, as Reuchlin did the Hebrew Scriptures, and a multitude of classical authors in both Latin and Greek; for he was a most painstaking scholar and searcher of libraries for ancient manuscripts. And yet he was no mere bookworm, but was a lover of human society, and awake to every call of free thought or human rights. He never broke from the Roman rule, and yet so positive was he in his evangelical faith, and so frank in his denunciations of formalism and superstition, that he was called a heretic, and deserved the honor of it. We recall the man who said of President Cleveland, "I love him for the enemies he has made," and this is what Erasmus said long before, "To displease the evil is itself praise." Was he a coward that he did not break away utterly, as did Luther, as if Rome were past reform from within? Not at all. He was a reformer, not a revolutionary. He dared to expose and ridicule the excrescences of religion, and to stand the risk of it, but he had the genial hope that there could be reform without secession. He thought it better policy to re-create from within than to overturn from without. In his *Colloquies* he takes occasion now and then to mention his contemporary, Luther, but never with disrespect; altho the epigram has been credited to him, as applied to Luther, that "all comedies end in marriage."

His fame will not die. His will remain a *nomen praeclarum,* but does any one read him now? I very seldom hear him quoted or referred to in any way except as one of the bygones famous in his day. And yet for philosophy, for ethics, for theology, for religion, for criticism, and particularly for the painting of the life and character of his times, for humor and persiflage, few writers can compare with Erasmus. It may be that some Catholic priests read him still; but his *Colloquies* and his *Praise of Folly* are unfamiliar whether in the original or in translation, and have never once been reprinted in this country. The little Tauchnitz edition was printed in Leipzig in 1828, and I think this edition, with a bulkier one, suffices to the present time. There is a translation, I believe, but I have never happened to see it in any gentleman's library; and very seldom does Erasmus appear in catalogs of second hand books for sale. The name of *The Praise of Folly, Encomium Moriae,* is not wholly unfamiliar, but who has read it? Who knows that its title was a play on the name of his dear friend, Sir Thomas More? And yet, for two centuries his were the most popular of books. Twenty-five thousand copies of the *Colloquies* were sold in Paris in a few months, in edition after edition, and a hundred years later Milton found every one reading it in Cambridge. But every one read and talked Latin in those days; nobody does now.

A friend lately gave me, out of an old library, a copy of the Tauchnitz edition

of the *Colloquia* and the *Encomium Moriae,* which I had never before seen, nearly eight hundred small but closely printed pages. I found it delightful reading. It is familiar and easy Latin, except for medieval words which one will not find in Cicero or Virgil. Erasmus did not try or pretend to write classical Latin, but the colloquial Latin of his day; and Latin came easier to him than did German or French or Italian or English. He did not need to talk any one of these languages, except to boors, for all but the ignorant talked Latin. Was not the Duke of Alva laughed at for his bad Latin when he replied to the Dutch burghers, *"Non curo tuos privilegios"?*

To Erasmus must we go for the intimate picture of life at the period when the Dark Ages were beginning to glimmer with the morning light of learning, and when superstition in the Church, and feudalism in the state, and corruption in society, were at their worst and began to be resented. At this time no other scholar had so wide an acquaintance as had Erasmus or was so much sought. He visited all the centers of learning, knew everybody worth knowing from Rome to Canterbury, understood the conditions in the Church or in the schools of learning, and very freely does he paint it all in the *Colloquies,* which every one read then, and every one should read now who cares to know how men lived and how they thought in that most wonderful period when the discovery of printing and the discovery of the New World had begun to change the face of Europe, giving it new knowledge, new wealth, new independence and new diseases.

In his amazingly frank criticisms of the follies and vices of his day Erasmus escaped direct responsibility by putting his attacks into the mouths of his colloquists. When he wished to lampoon the ignorance of the University of Louvain, he meets the Muses on their way to a wedding and asks them if they will not stop at Louvain; and they answer, "Why should we go there, where there are so many swine grunting, asses braying, camels snorting, jackdaws squawking, jays chattering?" But the Muses allow that there are three or four decent scholars at Louvain, and there will be more when they get the promised endowment; but for the present let all the rest of them go hang.

Erasmus was no weeping philosopher, and he defended his cheerful spirit by declaring that "they are greatly mistaken who babble about Christ as if he were a sad and melancholy body, and had invited us to a disagreeable sort of life." Indeed, he had a large way of harmonizing the Stoic and the Epicurean, as in the following fine passage:

> What is there strange in the idea that the soul of the truly religious man should be always rejoicing tho in a mortal body, when the same soul, even were it plunged in the lowest Hell, would lose no whit of its happiness. For where there is a pure mind, there is God; where God is, there is Paradise; where Heaven is, there is felicity; where there is felicity, there is true joy and unmixt delight.

That is hedonism and ethicism in one.

Erasmus and Luther were contemporaries; Erasmus was born in 1466, Luther in 1483; Erasmus died in 1536, Luther in 1546. Luther had the rude courage of a revolutionary. If a thing was wrong he would change it directly and roughly. Erasmus was of a gentler spirit. He would overturn nothing. He was content to see the weaknesses and excrescences in what was in essence good, hoping they could be cured by exposure and ridicule. He stood by the Church which Luther would overthrow. Luther's coarse and rough-and-ready ways were distasteful to Erasmus; and yet at heart Erasmus was with Luther's theology. He was what would be called in these days a Modernist. How could the man who gave us the *Editio Princeps* of the Greek Testament be anything else? He believed in faith just as Luther did, and could hold it in the Catholic Church, with all the liberty of Protestantism to interpret the Scriptures for himself, for his days were before the Council of Trent. There was more liberty in the Latin Church then than there has been since. The corruptions and superstitions disfiguring the Church could be attacked then without incurring condemnation. Erasmus could abuse the monks as freely as Chaucer or Dante had done. He could have the courage to deny the value, as he did plainly and frequently, of prayers to saints, instead of going directly to the loving Father. In death he

committed his own soul to God without confessing to any priest; for this he had taught in more than one of his *Colloquies,* and

"he folwed it himselve."

The contempt that Erasmus felt for the bulk of the ignorant priests of his day appears in the colloquy called *Funus,* in which one of the colloquists describes the death he had lately witnessed of two of his friends. One of them was a man of property, and had been attended by half a dozen physicians, who had quarreled among themselves as to the nature of his disease, and had demanded their fees before leaving the dying man to spiritual direction. Then first came in a Franciscan, who heard his confession; then a company of mendicant monks, "vultures" they are called; and the parish priest was sent for, that he might give extreme unction and "the symbol of the body of our Lord." Why only the "symbol?" the reader may ask. Immediately the parish priest got into a bitter quarrel with the monks, and right about the sick man's bed. He was told that the Franciscan had heard the confession, which was *his* right, and he refused to give the oil and the eucharist or burial unless it were repeated to him, for he must give account to God. The monks—Franciscan, Dominican, Mendicants—all attacked him, called him an ass, fit only to herd swine. "I," said the Dominican, "am a baccalaureate in sacred theology, soon to be made doctor, while you can scarce read the Gospels; how can you draw out the secrets of conscience? And tell me about the sort of wife and bastards you have at home." The parish priest angrily answered, "I could make better baccalaureates out of barley straw." They ought to be doing mission work, he said, in the poor districts instead of hanging about cities and rich people. "Not one of you shall preach in my church. And what difference does it make to you what I do in my own home?" and he sent back worse charges of scandal against them not here to be repeated. The sick man could stand it no longer, and said he would repeat his confession to the parish priest, and begged them to be still, and he promised they should all be paid for the funeral rites before they left the house. So they got their money and left, but the quarrel continued outside. Then follows the long story of how the dying man was besieged by leaders of the monks who returned to his bedside and forced him to make his will in their behalf, promising him forgiveness of all his sins, and requiring that his widow and her sons and daughters should enter monasteries and convents. We are then told of the extravagant funeral expenses, with the presence of hordes of monks, all paid for their attendance. The whole picture is a shocking one, even tho it may be exaggerated, and Luther himself could not have painted the conditions of his time worse.

In contrast with such a death and funeral Erasmus tells how another man died who had lived a modest Christian life. He felt the approach of death and on Sunday, four days before the end, he went to church, made his confession to his parish priest, heard the sermon and partook of the sacrament. He was attended by a single physician who was a good man as well as a good doctor. He put his protection in God rather than in physicians. He gave direction that such gifts as his family could spare should be given to the honest poor, but not to mendicants. He took great pains to give his family no trouble, and he had portions of Scripture read to him which tell of love and trust in God. He bade his wife and children to cling together affectionately and to avoid debt. His will he had made long before, but not a penny did he give to the monasteries. Nor did he call in any further ghostly adviser, except that his parish priest gave him extreme unction, and he received the sacrament, but without repeating his confession, for he had no further confession to make. He bade the priest to bury him as modestly as the humblest Christian would be buried, absolutely with no display. He would have no masses or prayers paid for his soul, for the merits of Christ were enough. He said to his parish priest:

All my hope rests in two promises, one that Jesus Christ has taken away my sins, nailing them to his cross; the other that with his sacred blood he has written and sealed the bond by which those are assured of eternal salvation who put their whole

confidence in him. From the justice of God I appeal to his mercy.

Here is a passage from his *Ichthyophagia,* the "Eating of Fish," in which he puts his own view into the mouth of one of his interlocutors:

I see and hear a great many whose chief piety consists in places, garments, food, fastings, gesticulations, chantings; and they suppose the substance of religion to consist in these things, in contradiction to the gospel precepts. So it comes to pass that, while Scripture bases everything on faith and love, such superstitions as these discard them both. For he has wandered far from evangelical faith who trusts in these things; and far from Christian love who for the sake of food and drink, which any one can use rightly, makes his brother to offend for whose liberty Christ died.

But that sort of modernism, as Erasmus expounded it, offended the mass of religious teachers, for the dialog concludes by there appearing by ill luck "a certain ragged, sallow, wrinkled, bloodless, cadaverous looking fellow with only three hairs on the top of his head, who shut his eyes whenever he spoke, and who, they said, was a theologian. He called me a disciple of Antichrist, and sputtered a lot of other things."

Just as one feels the modernness of Greek intellectual enterprise, or that of the new Japan or new China in contrast with the old, so here the new birth of thought, with its eagerness for fresh discoveries and its critical spirit, both surprises and delights us. Even the ineptnesses of modern education find their parallels in the writings of Erasmus. It would seem as if he were ridiculing some doctors' theses of our times when lampooning the folly of grammarians:

Observe his delight if one of them has discovered who was the mother of Anchusa, or has come across some word not generally known in some musty old parchment, such as *bubsequum,* or *bovinatorem,* or *manticulatorem;* or if one of them has somewhere dug up a piece of an old stone marked with worn letters—oh, Jupiter! then what exultation, what triumphs, what praise, just as if they had conquered Africa or captured Babylon.

And we are reminded of the swarm of magazines of poetry springing up today, with their mutual admiration clubs, when we read:

With what delight do they show again and again their miserable little stupid verses; and they find those who admire them; just as if they believed the soul of Virgil had entered into their breast! And of all things nothing pleases them so much as when they can meet together and praise and admire and tickle each other. And when apart it is their highest delight with letters and poems to swap mutual laudations; dunces praising dunces and praised by dunces.

Such a passage as the following I would commend to those who have but one excuse, their ignorance, for disdaining the culture that comes from reading Æschylus or Plato or Cicero or Virgil. While Erasmus gives the first place to the Sacred Scriptures, he finds food for character outside Palestine:

Surely that never should be called profane, wherever found, which conduces to good character. The first authority should always be given to the sacred writings, but yet I occasionally meet some things either said by the ancients, or written by them, even by poets, so piously, so purely, so sacredly, so divinely, that I cannot persuade myself but that when they wrote such things some spiritual power had moved their heart. And perhaps the Spirit of Christ had extended its influence more widely than we have been ready to admit, and many there may be in the company of the saints whom we have not inscribed in our catalog. I confess, here among you friends, that I cannot read those treatises of Cicero's, "On Old Age," "On Friendship," "On Duties," and the "Tusculan Questions," without kissing the book, and venerating that sacred soul so inspired by the heavenly divinity. On the other hand when I read some of these more modern writings on politics or economics, or ethics, by God Eternal! how cold and dry they are compared with these, what a lack of feeling in what they write, so that I would let all Duns Scotus, and everybody like him, perish rather than a single book of Cicero or Plutarch. . . . When I read writings of this sort by such men as they I can hardly hold myself from crying out, *"Sancte Socrates, ora pro nobis."*

A hundred passages like these I could cull, if space allowed, from the *Colloquies* and *The Praise of Folly,* and I presume as many more from the *Letters of Erasmus,* which one of these days, *Fortuna favente,* I may discover, if not a big folio, in some catalog of second-hand books. But I would like to pass on the privilege of reading so lovable, so sensible, so masterly a creator of Renaissance and Reformation to others who have known him, as I had known him, only as a shadowy name. Shall we forget Erasmus?

Newark, N. J.

THE NEW BOOKS

Maeterlinck's Latest Book

When Maeterlinck's *Monna Vanna*, with its psychological complexity and richness of incident, showed a striking contrast with the static and mystic drama of the poet's earlier period, the critics were not slow to ascribe the change in style to a wish to provide a suitable medium for the talents of the charming actress, Georgette Leblanc, whom Maeterlinck afterward married; but *La Mort*[1] shows that there has been a profound modification in the philosopher's point of view, altogether apart from adventitious and personal considerations. The subject is one that lends itself to treatment by way of intuition and the exploitation of the sublimal self; but Maeterlinck's method is that of close reasoning, and much of his material is derived from psychical research. Unfortunately for the English reading public, this is by no means so evident in the translation by Alexander Teixeira de Mattos[2] (copyrighted by Maeterlinck in 1911 and published in January, 1912) as in the French version, which bears 1913 as its date of production and copyright. The dates seem to indicate that the French edition, which is very much fuller, is later than that used by the translator, Maeterlinck having apparently made very considerable additions before the French edition appeared. The divisions and chapter headings of the two books are entirely different, so that it is no easy matter to compare them; but close examination shows that the first 44 pages of the translation correspond to the first 66 of the French text, which has a somewhat heavier page; one remarks omissions here and there, but they are not important. But all the middle of the French version, including chapters 4 to 8, and extending from page 67 to page 177, is left out of the English translation without a word of excuse. This is the more to be regretted because the chapters omitted are of considerable interest to American readers, including Maeterlinck's judgment on the attempts to establish communication with the unseen world in which William James interested himself during his lifetime, and, according to some believers, since his death. Speaking of the spirits supposed to be summoned by the mediums he says:

> They give us a first impression of the other world which is hardly reassuring, and we say to ourselves that the dead of today are strangely like those evoked by Ulysses three thousand years ago in the Cimmerian gloom—pale and empty shadows, terrified, unsubstantial, puerile, stupefied, like dreams, more numerous than the falling leaves of autumn, and like them trembling in the unknown gusts of the great spaces of the other world. They have not even enough life to be unhappy, and appear to drag along, one knows not where, a precarious and idle existence, to wander aimlessly, to prowl about us, to dream or gossip among themselves of the little things of earth; and when their night is cloven by a gleam, they run and hasten from all parts, like whirlwinds of frightened birds, greedy for light and the sound of a human voice. One recalls in spite of one's self the sinister words of the shade of Achilles, emerging from Erebus, in the Odyssey: "Speak not to me of death, Ulysses! I had rather be a laborer, and serve for wages a poor man hardly able to maintain himself, than rule over all the dead who have ceased to be."
>
> What have the dead of today to say to us? First of all, it is remarkable that they appear to be much more interested in affairs here below than in those of their own world. They seem jealous first of all to establish their identity, to prove that they still exist, that they recognize us; that they know everything; and to convince us of this, with extraordinary precision, perspicacity and prolixity, they enter into the most minute, long forgotten details. They are extremely skilled in disentangling the complicated family relations of their questioner, of some one present at the séance, or even of an unknown person who happens to enter the hall. They recall the little weaknesses of

[1] *La Mort.* Par Maurice Maeterlinck. Paris: Charpentier. 3 fr. 50.

[2] *Death.* By Maurice Maeterlinck. New York: Dodd, Mead & Co. $1.

one, the sicknesses of another, the tricks or aptitudes of a third. They perceive events at a distance; they see, for example, and describe to their auditors at London some insignificant episode which is taking place in Canada. In a word, they say and do almost all the disconcerting and inexplicable things we sometimes get from a first-class medium; perhaps they even go a little further, but from it all there emanates no fragrance whatever, no gleam from beyond the tomb such as we were promised and were expecting.

In spite of this tone of discouragement, into which it would be easy to read a touch of skepticism, Maeterlinck treats the investigations of the English and American Societies for Psychical Research with respect. He is especially imprest by the attitude of William James. "We have here," in Maeterlinck's opinion, "a serious problem, the gravest, if the evidence were beyond dispute, that we have had to solve since the coming of Christ; and it cannot be dismissed with a shrug of the shoulders or a peal of laughter." He deals less sympathetically, tho at no less length, with the experiments in auto-suggestion conducted in France by Colonel Rochas with the view of establishing the theory of reincarnation. Even if it were scientifically established, this theory would not answer our questions as to the beginning and the end; it merely puts them off a few centuries.

Meanwhile I had rather know that I know nothing than cherish illusory and irreconcilable assertions. I had rather hold to an infinite of limitless incomprehensibility than restrict myself to a God whose incomprehensibility is everywhere limited. Nothing forces you to speak of your God, but if you undertake to do so, your explanations must be superior to the silence they break.

A page or two later, the English version again joins issue with the French; 76 pages of French dwindle into 62 smaller pages of English; one notices the omission of here and there a paragraph, here and there a page or two; but the thread of the argument can be easily followed. The most striking lacuna after that in the middle of the book noticed above is at the end; the final chapter of fifteen pages headed "Conclusions" is represented by an English paragraph of only eleven lines. Assuredly this is not what one has a right to expect of an authorized translation. The English version is well and faithfully done, so far as it is done at all, and it makes a charming little book; but the Maeterlinck lover who wishes to have the sage's whole thought will have to turn to the fuller French text until such time as a new and complete edition in English is published.

J. W. CUNLIFFE.

Empires of the Far East

Here is a notable book. The author, an Englishman with personal knowledge of his subject, aims to present "an impartial account of the peoples of the Far East, their social and political problems and their activities generally."*

The bulk of the work deals with Japan. Little of importance relating to that empire has been overlooked; frequently native authorities are cited. Be it geographical, historical, legal, military or political, the mass of information regarding Japan is so encyclopedic, so nicely sifted, so clearly presented, that the work gives the most up-to-date record of what Japan was, is, and may become. Such authentic facts about a people much misunderstood and often misjudged are welcome. Be he the student bewildered by the sudden rise of Japan from a supposed semi-barbarous civilization to international equality—except where the United States is concerned; be he the statesman mindful of the influence Japan must wield in Asia and on the Pacific; be he the merchant eager to extend his trade to the East and especially to develop the vast resources of Korea and Manchuria; be he the man who fears that unless the teeming peoples of the Eastern Empire at least understand the principles of Christianity, the material civilization they are borrowing so fast will be only a danger to them and a menace to us, the reader of Mr. Lawton's work will find much to help him, much to make him realize the importance of the Far Eastern questions.

With no inconsiderable success has the author steered a middle course. He has avoided, on the one hand, unrestrained adulation and, on the other, has refrained from abuse. To those who have

*_Empires of the Far East._ By Lancelot Lawton. 2 volumes, 8vo. Boston: Small, Maynard & Co. $7.50.

lived any time among the Japanese this restraint will come as a welcome relief from the customary extravagance of praise or censure.

In questions pertaining to the Russo-Japanese war full credit is given the Japanese for their careful preparation, their efficient conduct of the struggle and the superb valor of their troops. To the Russians justice is given their brave soldiers and blame to their wretched system and unworthy officers. At the Portsmouth Conference, it is clearly shown, the late Marquis Komura, asking for the maximum and out-generalled by Count de Witte, really gained as much as was Japan's proper share.

Concerning missionary effort in Japan an unbiased view is taken. In the concise history of Christianity, both in old and new Japan, one is made to feel the present governmental influence to exalt Shinto to a state church, and the real hold upon the masses of the gorgeous ceremonies of Buddhism. Not the least interesting chapter is entitled The Cry for a New Religion. One reads that "When the best possible view is taken of the present position of Christianity in Japan there remains the fact that there is not the slightest sign of any general desire on the part of the people to accept it. The dream of Japan as the Christian empire of the East is still a dream." Among the serious obstacles confronting Christianity in Japan are the belief in the divinity of the Emperor, the value placed on human life by Christianity opposed to the Buddhist teaching that life has no value, and the importance of the individual in Christianity. Such reasoning as this from a noted Japanese writer is common: "Russia went to war with us as a Christian nation. Her success was prayed for over a large portion of Christendom. But she suffered defeat at the hands of a non-Christian nation. While professing the Christian religion the behavior of her troops was in every way worse than that of our soldiers." Christianity opposes suicide, imposes a far stricter moral code and conflicts with the widespread agnosticism of modern Japan. Thus, there has grown up in Japan a cry for a new religion.

Sections on the status of women in Japan truthfully state the case and frankly face the facts. The peculiar position of the *geisha* is correctly understood and rebuked: "The conduct of a government that permits and legalizes a system of social slavery in the midst of a community that it seeks to guide is still a matter for the severest censure. As a matter of fact, the social conscience of Japan has still to be awakened." The extent of ground covered will be further understood by enumeration of the chapters on the educational system, journalism, the growth of socialism, the labor question, finances, trade and industry, mines and mining, government monopolies and, especially, business and business men.

Nor is the story of modern Korea neglected. Beginning with the Palace tragedy in 1895, recounting the various stages that led up to the protectorate, it closes graphically with the annexation and the passing of Korea from among the nations. In spite of probable arrogance on the part of Japanese officials, one is forced to the conclusion that the fall of Korea was primarily due to the unworthiness of her own people.

The bountiful resources of Manchuria were investigated by the author in an extended tour he made of that great region. Thruout this whole work one feels that wherever possible one is receiving either first-hand impressions of the author himself or opinions of the best local authorities. The fact that neither Russia in the north nor Japan in the south of Manchuria, in spite of repeated assurances of the Open Door, has really any practical intention of keeping these promises is repeated. Numerous instances of unfair advantage given their own citizens by the Japanese authorities are cited, and the subpect is recommended as one suitable for diplomatic representation.

The chapters dealing with China begin with the awakening in 1910 and carry the great drama thru the downfall of the Manchu dynasty. Nothing could be more picturesque than the revolutionary edicts, the imperial proclamations and the singular relations of Yuan Shi-kai with the Manchu Court on the one hand and the ardent Republicans on the other. The dynasty was doomed. Yet

Yuan Shi-kai had to perform the thankless task of returning from banishment to serve the Court, of trying to make the best terms for the corrupt Manchu party, and of delaying the establishment of the very republic of which he was unanimously elected first President by the Sons of Han. No one but the most consummate diplomat and judge of men could have steered with safety thru such a sea of troubles as beset this "indispensable" statesman.

In urging that China be accorded the sympathy and support of the British Government and the British people, Mr. Lawton writes:

> This is the only course we can adopt, for it constitutes a moral obligation from which, if we are to remain true to our traditions and at the same time fulfil our duty to posterity, we dare not turn aside. China is no decadent among nations, and altho it may still be her lot to pass thru the deep waters of tribulation, she is destined to emerge a strong and enlightened Power to take her place in the forefront of civilization.

Shakespeare's Sonnets

As long as men exist here, they will discuss the question of a possible existence hereafter in another Here, and the discussion will always admit of its "pros" and "cons." The Ingersoll Lectureship at Harvard University provides for an annual lecture upon the subject by some leader of thought. Prof. George H. Palmer of Harvard being appointed to deliver the thirteenth lecture, and finding his twelve predecessors to have approached the subject by all the customary roads, finds in the sonnets of Shakespeare a side path of value and interest (*Intimations of Immortality in the Sonnets of Shakespeare,* Houghton). The sonnets he argues, have a certain unity of purpose—the theme Love, and the purpose to find a way to make not love alone but the object of love permanent. To the individual living here on earth, the permanency is never assured.

Ruin hath taught me thus to ruminate,
That Time will come and take my love away.
This thought is as a death, which cannot choose
But weep to have that which it fears to lose.

For his argument, Professor Palmer divides the sonnets into three groups, "contrasted and unequal, the first comprising the first seventeen, a second of one hundred and nine, and a final group of twenty-six. The speaker thruout is Shakespeare. The person addressed is, in the first two groups, a man; in the last, a woman." The general theme being love, its transitoriness, its perpetual tragedy, how can it be made permanent and satisfying? Shakespeare suggests three ways to this end: permanence in type, which the lecturer calls Natural Immortality:

Nothing 'gainst Time's scythe can make defence
Save breed, to brave him when he takes thee hence.

This is the Ideal Immortality. "So long as men think, read, love, follow beauty, this exquisite youth shall be their companion." And more than this:

Your monument shall be my gentle verse,
Which eyes not yet created shall o'erread;
And tongues to be your being shall rehearse,
When all the breathers of this world are dead.

This Ideal Immortality has its satisfactions, but they are not conclusive. It is something to be "pyramidally extant"; but there is in the poet a hint of a step beyond:

Love's not Time's fool, tho rosy lips and cheeks
Within his bending sickle's compass come;
Love alters not with his brief hours and weeks,
But bears it out even to the edge of doom.

"To the edge of doom" is a far cry, but it is still Love and not the lover that lives forever. "A prized and glorified remembrance, an ideal presentation of him who is done with time, remains." Is this ideal being the soul? And can it, having thrown off its entanglements, resume the chase? Is it not an intimation of a higher, a spiritual immortality that the poet reaches in the one hundred and forty-sixth sonnet of the final series?

Poor soul, the center of my sinful earth,
Fooled by these rebel powers that thee array,
Why dost thou pine within and suffer death,
Painting thy outward walls so costly gay?
Why so large cost, having so short a lease,
Dost thou upon thy fading mansion spend?
Shall worms, inheritors of this excess,
Eat up thy charge? Is this thy body's end?
Then, soul, live thou upon thy servant's loss,
And let that pine to aggravate thy store;
Buy terms divine in selling hours of dross;
Within be fed, without be rich no more.
So shalt thou feed on Death, that feeds on men,
And Death once dead, there's no more dying then.

Here, says the lecturer, "Man is a spirit, no mere creature of circumstance, passive, instantaneous, depending on alien forces within and without, which sweep him along their blind current, regardless of any good of his own. He is an active being, dictatorial over time and circumstance, with power to compel chance and change to work for his permanent welfare." Not that Shakespeare intentionally pushed this argument. The lecturer does not think that. The argument pushed him. "In the exigencies of the day he has come upon it. Mortality has proved unthinkable. He has been unable to state his deepest experiences except in terms of permanence." This is but an outline of the lecturer's argument, with little of the rare beauty of his expression. The whole book is worthy of a lining up with the lectures of John Fiske and Professor Royce on the same subject.

The Laboring Class and Its Budget

National budgets are very important and at times even very interesting, but it is doubtful if they have half the significance of individual budgets. Nothing, therefore, can be of greater interest to anyone wishing to find out how the mass of the "working class" lives than such figures as those in Maurice Halbwach's study of *La Classe Ouvrière et les Niveaux de Vie* (Paris: F. Alcan). This book is based chiefly upon the official reports of Germany; it deals with the distribution of the family income among the various forms of expenditure: lodging, rent, food, etc.; the relative amounts of the different kinds of food eaten; the effect of the size of the family and the size of the family income as related to this distribution. There is also an elaborate general discussion as to the nature of the proletariat and its place in modern society.

Our Immigrants at Home

Rev. Francis E. Clark has written a most interesting and instructive volume about the territories and peoples which make up the heterogeneous mass known as the Austro-Hungarian Monarchy. The descriptions of country and city life, bits of characteristic history and story, anecdotes of travel, and the necessary infusions of geographical and linguistic knowledge, help the reader in a pleasing way to untangle the complex racial, governmental and social systems which prevail in those *Old Homes of New Americans* (Houghton, $1.50). Dr. Clark rightly begins with some account of the present situation and runs back into the history of racial and political change for the explanation and valuation of existing characteristics and conditions. By this method he leads his readers to an unusually clear understanding of the antecedents of those immigrants whose national and racial names so often mean little or nothing to the average American. The book will do much toward creating a just estimate of the native worth of these peoples, and is all the more welcome because so large a proportion of our present immigration comes from the section of Europe of which the author speaks.

Royal Family Skeletons

Peeps into family skeleton cupboards have a charm for us all, deny it if we dare, and that same curiosity which gave Bluebeard excuse for his matrimonial adventures is still alive. Behold then in *My Past* (Putnam, $3.50) a repository of strange secrets. The authoress, Countess Marie Larisch, was the favorite niece and confidante of the Empress Elizabeth of Austria, and her frank statement of many details of the tragedies which pursue the house of Austria seem to bear the stamp of veracity.

It is principally as a vindication of her innocent connection with the suicide of the Crown Prince Rudolph of Austria that this volume sees the light. Tho at first sight a love tragedy, the final act of his liason with the Baroness Mary Vetsera, it is plainly stated here that the prince was conspiring against his father, Francis-Joseph, and an attempt to seize the throne of Hungary was contemplated. Hereditary forces, that taint of degeneracy and madness which has cursed the Hapsburgs, contributed to this suicide, which was officially explained as an accidental shooting.

Many interesting details of the life of Elizabeth and her love affairs, of the Emperor, of members of the family and its entourage, are given without reserve, and new light cast upon many things long a mystery in international circles. The writer has, in her griefs, paid over and over again for the follies she confesses here.

The Ordeal

The Ordeal, by Charles Egbert Craddock, is lacking in none of the charm which characterizes the novelist's style. The scenes are laid chiefly in the Tennessee mountains and more particularly around a bungalow used as a summer home by the main characters. The action centers in the kidnapping of a child by some moonshiners. Aside from the dramatic quality of the book, the descriptions are some of the best that have come from Craddock's facile pen.

The Story of the Borgias

Within the last few years a number of biographers have illuminated for us those fascinating days of the greatness of Florence when, during the fifteenth and sixteenth centuries, her art came into its flower, Cellini carved his matchless marbles, Fra Angelico painted his altar pieces on his reverent knees, Beatrice d'Este and Isabella d'Este held sway, Lorenzo the Magnificent built his palaces and his and the Borgia family waxed powerful. The Borgia family especially has fascinated all who have been interested in Florentine history. One generation of historians painted them as monstrously infamous, but now the pendulum swings back. Today even the crafty Lucrezia is painted as a lovely woman, innocent of guile. The present writer, John Fyvie, is a scholarly Englishman who has delved deeply into both sides of the story and has produced pleasantly written accounts of the lives of Rodrigo, Cesare and Lucrezia Borgia, which are well balanced and at the same time present a vivid picture of times most picturesque. (*The Story of the Borgias.* Putnam. $4.50.)

Literary Notes

An unusually helpful book for teachers of literature in secondary schools is *Studies in Literature* by Frederick M. Tisdel (Macmillan), as it is clear in presentment and as discriminating in its criticism as is consistent with the concise style demanded by the brief compendium.

Clarence M. Weed tells us in *Seeing Nature First,* that just as we should see the Rockies before visiting the Alps, so one should take pains to see and recognize the flowers, the trees, the butterflies and the frogs in his own town before trying to take in the whole country. This handsome volume (Lippincott, $2) has over a hundred illustrations and tells in a simple way, without needless rhetoric and poetry, how to learn the secrets of nature in field and forest, and a child or a grown-up will learn much from it that it would be a delight to know. The information given can be trusted.

The papers and proceedings of the second session at Chicago of the Federal Council of Churches are gathered in a volume, *Christian Unity and Work,* published by the Council in New York (215 Fourth avenue, N. Y., $1.). In the illness of Dr. E. R. Sanford the volume is edited by his successor as secretary, Charles S. Macfarland. It will show the unity of our Protestant churches, whether in religious work or in social service. The Federal Council is the best expression of that unity and the volume indicates the directions of its activity.

Silas Deane is the title of the book which George L. Clark devotes to the career of the Connecticut patriot (Putnam, $1.50). As commissioner with Franklin and Arthur Lee, Deane played a fairly important part in what we may call the business administration of the American Revolution, and tho he was recalled from Paris and subjected to calumny, his memory is very properly cleared from all this in the volume before us.

Marmaduke Pickthall's *Veiled Women,* with its frank disclosure of harem life, in which the slightest trace of intellect is denied to the occupant, is interesting in its contrast to the emancipated intelligence of the modern western woman. The English orphan, governess in an Egyptian Pasha's family, tired of her country, careless of her religion, lured by the physical charm of the Pasha's son and the exotic charm of the harem, evokes small sympathy. Of her own free will she chooses to embrace the religion of her husband and to acquiesce in the customs of her adopted country and faith. She sets herself to forget all that she has learned, to sink to the level of the others in the harem; her son is reared to hate the English and her training brings him indirectly to his death. (Duffield, $1.25.)

A valuable addition to the Oliver Ditson Company's "Musicians' Library" is the *Sixty Patriotic Songs of All Nations,* edited by Granville Bantock. Besides the song every one would expect to find, the volume contains such less familiar ones as the "Bergen op Zoom" of Holland, the stirring "Hymn to Freedom" of Greece, and the Hebrew "Song of Moses." Yet the musician may leave the collection with a renewed impression of how few patriotic songs attain the dignified nobility of the Russian national hymn, which no nation has surpast. And the strictly impartial critic cannot escape the conviction that our own "Star Spangled Banner" and "Yankee Doodle" cut none too praiseworthy a figure beside other national songs. Certain minor points may excite wonder: it is rather surprising to find the line, "Then success to ould St. Patrick's fist," becoming "So success attend St. Patrick's feast." But Professor Bantock has done his editing with comprehensive notes and has provided accompaniments which aim rather to enhance the spirit of each song than to display the editor's polyphonic skill. ($1.50.)

WELL SAID

NOTABLE PARAGRAPHS FROM THE NEW BOOKS

Life After Death

Our spiritual being, liberated from its body, if it does not mingle at the first onset with the infinite, will develop itself there gradually, will choose itself a substance and, no longer trammelled by space and time, will grow without end. It is very possible that our loftiest wishes of today will become the law of our future development. It is very possible that our best thoughts will welcome us on the other bank and that the quality of our intellect will determine that of the infinite that crystallizes around it. Every hypothesis is permissible and every question, provided it be addressed to happiness; for unhappiness is no longer able to answer us. It finds no place in the human imagination that explores the future methodically. And, whatever be the force that survived us and presides over our existence in the other world, this existence, to presume the worst, could be no less great, no less happy than that of today. It will have no other career than infinity; and infinity is nothing if it be not felicity. In any case, it seems fairly certain that we spend in this world the only narrow, grudging, obscure and sorrowful moment of our destiny.—[From Maurice Maeterlinck's *Death* (Dodd, Mead).]

Law and Justice

There is in all modern states today a general conflict between certainty in the law and concrete justice in its application to particular cases; in other words, between the effort to have a general rule everywhere equally applicable to all cases at all times and the effort to reach what may seem to be concrete right dealing between the parties at bar upon the particular facts in each case. On the one side is made an appeal to "Progress"; on the other to "Precedent."

In actual practice the pendulum swings first one way and then the other. The social necessity for stability in the law is unquestioned. Law is necessarily a rule of action, and unless a court decided cases according to some cohesive plan or definite rules, the justice administered is scarcely deserving of the name of *law*, however closely it may fall in with the ethical notions of the community as regards any particular case. On the other hand, when rules become so fixed and rigid that they are difficult or impossible to change, the law is out of touch with prevailing views of social expediency, which, like other opinions, are constantly changing; the law thus necessarily becomes a clog upon national development, an incentive to revolutionary reform. —[From *Certainty and Justice*, by Frederic R. Coudert (Appleton).]

New York's Skyline

Twenty years ago the skyline was hardly inspiring. Now . . . the low sandy spit of Manhattan Island which our grandfathers knew is thronged by extraordinary palaces and topped by the Woolworth Building. Honeycombed with eyes are all these habitations, eyes that watch the Old World as it enters the New. War from without would mean warring upon marble cliffs. Nineveh had not their match, and on their miles of roofs are gardens which make the description of Babylon childish. What a fabulous entanglement of styles, with structural lines effaced, of bold gross masses, not unlike Benezzo Gozzoli's quaint Babylon. To shut out the overmastering vision you turn your back and the sights of Governor's Island, Ellis Island and the Goddess of Liberty reassure you. The statue is still as ugly as ever and her torch a menacing club in a mailed fist. It commands: "Work!" Over the portals of Ellis Island might be inscribed—(Dante *à rebours*)—"All despair abandon, ye who enter here"—for New York is not a city of Dis; it is the mouth, the melting-pot of America, and in America there is ever hope for the hopeful. . . .

I recall the days when Walt Whitman's "mast-hemm'd Manhattan" had an actual meaning. Now it is funnel-encircled Manhattan, and in a few years it may be a Manhattan of aeronauts. Tullio Lombardo, Bernini and Christopher Wren could not in a triple fantasia evolve such a *pasticcio* as this island town. It stuns. It exalts. It is inconceivable; yet there it stands, unashamed, with its absence of rhythmic architectural values and its massive extravagances.

New York is not beautiful in the old order of æsthetics. Its beauty often savors of the monstrous, for the scale is epical.

Too many of our buildings are glorified chimneys. But what a picture of titanic energy, of cyclopean ambition, there is if you look over Manhattan from Washington Heights! The wilderness of flat roofs of London, the winning profile of Paris, the fascination of Rome from Trinità dei Monti, of Buda from across the Danube at Pesth: these are not more startling or dramatic than New York; especially when the chambers of the West are filled by the tremendous opal of a dying day, or a lyric moonrise paves a path of silver across the hospitable sea we call our harbor.—[From James Huneker's *The Pathos of Distance* (Scribner), pp. 187-189.]

Carlyle's Cure for Insomnia

FRIDAY, JANUARY 17, 1873.

After lunch went to Carlyle's and found him sitting alone in his study, smoking his long clay pipe. He gave me a pipe and we sat for an hour by the fireside and then went for a walk to the Park. He was in a most pleasant mood;—as I grow familiar with him, and a certain intimacy unites us, his character becomes more and more open and delightful, and I feel a real affection for him. The sincerity and simplicity and modesty of his nature are even more striking in personal intercourse than the originality of his genius, the liveliness of his fancy, and the geniality of his humor. He is one of the most sympathetic of men.

"I've not had much sleep since I last saw ye. It's an old complaint, and I'm wonted to it. That dinner at Forster's gave the finishin' stroke; I was as prudent as man could be, but I did not get to sleep till six o' the clock the next morning. And one's troubled with all kinds o' whirlin' thoughts in the long nights, specters and hobgoblins that won't be laid by any exorcisms, dance a wild reel thru one's head. We were talkin' about prayer the other day,—well,—I remember one night I'd been lyin' awake, tossing from one side to the other, and at last I turned over on my back, a posture I don't often take in bed, and all of a sudden the Lord's Prayer flashed before me, an' I saw it all plain written out from beginnin' to end. I don't think I'd used it officially for fifty years at least, but there it was—Our Father which art in Heaven, hallowed be Thy name; thy Kingdom come,—and I thought to myself that it was just the varra best compendium of everythin' that a man had need to say if he desired to make a prayer,—and as I was thinkin' I fell asleep.

"Yes (with a laugh) as you say, 'twould not be a bad notion to issue a tract entitled, 'Remedy for Sleeplessness, addressed to Sinners by Thomas Carlyle.' "—[From the Journal of Charles Eliot Norton, in *Scribner's Magazine.*]

The Life of Irony

The ironist is the only man who makes any serious attempt to distinguish between fresh and second-hand experience. Our minds are so unfortunately arranged that all sorts of beliefs can be accepted and propagated quite independently of any rational or even experimental basis at all. . . . We are born into a world that is an inexhaustible store of ready-made ideas, stored up in tradition, in books, and in every medium of communication between our minds and others. All we have to do is to accept this predigested nourishment, and ask no questions. We could live a whole life without ever making a really individual response, without providing ourselves out of our own experience with any of the material that our mind works on. Many of us seem to be just this kind of spiritual parasites. We may learn and absorb and grow, up to a certain point. But eventually something captures us: we become encased in a suit of armor, and invulnerable to our own experience. We have lost the faculty of being surprised. It is this encasing that the ironist fears, and it is the ironical method that he finds the best for preventing it.—[From *Youth and Life,* by Randolph S. Bourne (Houghton Mifflin).]

Classical vs. Scientific Culture

We still feel entitled to sneer at the millionaire who orders a painting of Jupiter and Io and complains that only one of the 10 is supplied and she without her clothes; whereas it is not regarded as a lack of culture when an eminent historian regards the Fissure of Rolando as a chasm in the Pyrenees.—[From Cattell's *University Control,* Science Press.]

The Song of Obligations

O the citizen's obligations.

The obligation of every American citizen to see that every other American citizen does his duty, and to be quick about it.

The janitor's duties, the Board of Health's duties, the milkman's duties, resting upon each one of us individually with the accumulated weight of every cubic foot of vitiated air, and multiplied by the number of bacteria in every cubic centimeter of milk. . . .

The obligation of teachers in the public schools to supply their pupils with all the aptitudes and graces formerly supposed to be the result of heredity and environment.

The duty of each teacher to consult daily a card catalog of duties, beginning with Apperception and Adenoids and going on to Vaccination, Ventilation and the various vivacious variations on the three R's.

The obligation resting upon the well-to-do citizen not to leave for his country place, but to remain in the city in order to give the force of his example in his own ward to a safe and sane Fourth of July.

The obligation resting upon every citizen to write to his Congressman.

The obligation to speak to one's neighbor who may think he is living a moral life, and who yet has never written to his Congressman.

The obligation to attend hearings at the State House.

The obligation to protest against the habit of employees at the State House of professing ignorance of the location of the committee-room where the hearings are to be held; also to protest against the habit of postponing the hearings after one has at great personal inconvenience come to the State House in order to protest.

The duty of doing your Christmas shopping early enough in July to allow the shopgirls to enjoy their summer vacation.

The duty of knowing what you are talking about, and of talking about all the things you ought to know about.

The obligation of feeling that it is a joy and a privilege to live in a country where eternal vigilance is the price of liberty, and where even if you have the price you don't get all the liberty you pay for.—[From *Humanly Speaking,* by Samuel McChord Crothers (Houghton Mifflin).]

What Is Poetry ?

A wish to experience life and the world. That is the essence of the poetic temper.

Children are poetic. They love to feel of things. I suppose it is necessary to their preservation that they should be, for by random exercise of their organs of feeling they develop them and make them fit for their practical function. But that is not the chief reason why they are poetic; the chief reason is that they are not practical. They have not yet felt the necessity, or got addicted to the trick, of formulating a purpose and then achieving it. Therefore this naïve impulse of nature, the impulse toward realization, is free in them. Moreover, it is easy of satisfaction. It is easy for children to taste the qualities of experience, because experience is new, and its qualities are but loosely bound together into what we call "things." Each is concrete, particular, unique and without an habitual use.—[From *Enjoyment of Poetry,* by Max Eastman (Scribner), pp. 6-7.]

Song

Marchaunt Adventurers, chanting at the windlass,
Early in the morning, we slipped from Plymouth Sound,
All for Adventure in the great New Regions,
All for Eldorado and to sail the world around!
Sing, the red of sunrise ripples round the bows again.
Marchaunt Adventurers, O sing, we're outward bound,
All to stuff the sunset in our old black galleon,
All to seek the merchandise that no man ever found.

Chorus.

Marchaunt Adventurers!
Marchaunt Adventurers!
Marchaunt Adventurers, O, whither are ye bound?—
All for Eldorado and the great new Skyline,
All to seek the merchandise that no man ever found.—[From *Tales of the Mermaid Tavern,* by Alfred Noyes (Stokes).]

The Head and the Heart

For all trouble there is sympathy, and for love there is memory, and these are the head and the heart talking to each other in quiet friendship. What the heart knows today the head will understand tomorrow, and as the head must be the scholar of the heart it is necessary that our hearts be purified and free from every false thing, else we are tainted beyond personal redemption.—[From *The Crock of Gold,* by James Stephens (Macmillan), p. 169.]

Life and Books

Life is language, and books only the dictionaries; men are the text, books only the commentaries. Books are only good as a filter for actual experiences. A man must have a rich and varied experience of men and women before he can use books to advantage. Life is varied, men and women many, while the individual life is short; wise men read books therefore to enrich their experience, not merely as the pedant does, to garner facts.—[From Price Collier's *Germany and the Germans* (Scribners).]

SURVEY of the WORLD

Civil Service for Private Employment

In the present-day craving for efficiency in all walks of private as well as of public service, it seems strange that the assistance of government civil service commissions is not more urgently sought. Not until within the last year or two has the bringing together of the efficient man and the job received much attention in this country. Some of the large employers of skilled labor have attempted to overcome this difficulty by "bespeaking" the graduates of the technical, law and commercial schools of our large universities, and by transferring skilled employes from one branch plant to another. But, aside from these measures, nothing of any account has been done toward filling vacant positions with worthy employes.

With the obstacles in the way of getting efficient help, I would suggest that business men and employers of skilled labor be permitted to go to the civil service eligible lists for candidates to fill the vacancies. Civil engineers, blacksmiths, teachers, bricklayers, scientific experts and common laborers, in short, men of all trades and professions desirous of entering the public service, not counting the thousands of applicants for clerical positions, must pass satisfactory examinations before being appointed. The men procured for service after such examinations are admittedly better than those who could not pass the tests, and yet those who could not pass are working in outside employment and seek positions they are unable to hold when obtained.

The application blank which each candidate for a civil service position must file is also a guaranty of his fitness. The details of his education and experience, easily verified, are given in the civil service forms much more completely and with greater accuracy than in the average candidate's "answering your ad." application. The prospective employer of an eligible from a civil service list would have a double check on the candidate, that as to his present qualifications and his past record—both sworn to in affidavit form and certified to by the Civil Service Commission. This information could be furnished on payment of a nominal fee.

To be brief—the granting to employers of labor thru the country the privilege of obtaining the names, with necessary information, of eligibles on civil service lists for the positions they have vacant, as well as permitting various municipal and state governments the right to select, when necessary, candidates from any civil service eligible list, would result:

(1) In bringing the proficient man and the job together far better than is possible at present.

(2) In the payment of higher salaries, for it is conceded that where there is competition for labor by employers wage standards are raised.

(3) In the greater distribution of skilled laborers thruout the country.

(4) In bringing a greatly increased number of efficient candidates to examinations under civil service.

(5) In eliminating the prejudice which the average civil service employe sometimes has to meet thru the acknowledgment then that he secured his position on merit.

(6) Valuable data for economic statistics would be available with reference to the demand for various trades and occupations, salaries paid, etc., affording a good index of the needs and prosperity of the country; and

(7) The standard of efficiency would be raised, in private as well as in public employment, by the holding of appropriate examinations for all skilled positions.

No More Drums for French Army

The investigating commission upon military affairs appointed by the French Government to make suggestions for army reforms has advised the War Office to abolish the kettledrum and bass drum in the army. It claims that upon active service the different signals cannot be distinguished, that the drums are rendered useless by wet weather, and further, that it takes three years to make a competent drummer, and that at the end of that time the conscript's period of service will be at end.

The suggestion has been received in military circles with amazement. The drum is in use on active service in the world's greatest armies. It was used in the Boer

War, in the Russo-Japanese War, and latterly by the Serbs and Montenegrins in the Balkan War. Military experts claim that the kettledrum keeps troops in marching order and is better for signaling purposes than the bugle, as the bugle call must necessarily be much longer. In the United States army the place of the drum has been to some extent taken by whistles, as in the order "Cease firing."

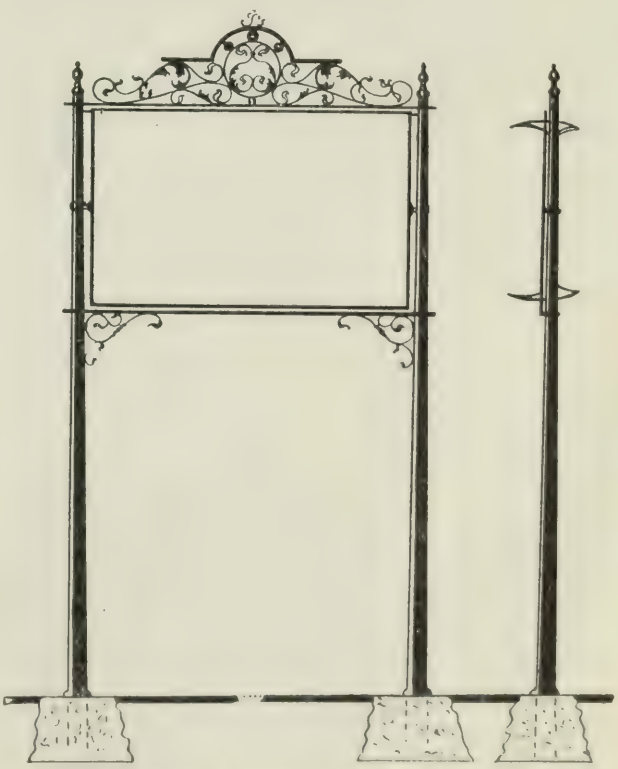
Weather Warnings for Aeronauts

Aeronautical meteorology is the inevitable corollary of the definite advent of aeronautics, and as the latter art flourishes more vigorously in Germany that elsewhere, it is but natural that the Germans were the first to verify Mr. Kipling's prevision, in his "Night Mail," of special weather warnings for aeronauts. Germany's aeronautical weather bureau has now been in operation since the first of January, 1911. There has been talk of establishing a similar institution in France, and all civilized countries will follow suit in due time.

The German bureau has its headquarters at the observatory of Lindenberg, the great center of upper-air investigations in Europe. In the present stage of the undertaking the routine work consists in assembling daily telegraphic reports of the force and direction of the air-currents at different altitudes over various parts of the Empire, and then communicating this information, along with a short-range weather prediction, to all persons interested, i. e., to the great army of German aeronauts. The observations are made at a dozen or more well-distributed stations by means of "pilot-balloons." These are small free balloons, the courses of which are followed from the ground with the aid of a theodolite. A few large observatories also send up captive balloons and kites carrying apparatus for recording the temperature, humidity and barometric pressure. Thus it is possible to supplement the ordinary terrestrial weather map with charts of the wind and weather at higher levels. The utility of such information to anyone embarking on an aerial journey is obvious.

Thunderstorms offer the greatest menace to the air-traveler, and special dispositions have accordingly been made for following the progress of these disturbances across the country. Several hundred postal telegraphers have been prest into service for this purpose. When a thunderstorm appears in the vicinity of a telegraph office its presence and direction of movement are at once reported to headquarters, whence warnings are issued to aeronauts along its probable path.

Alaskan Farms

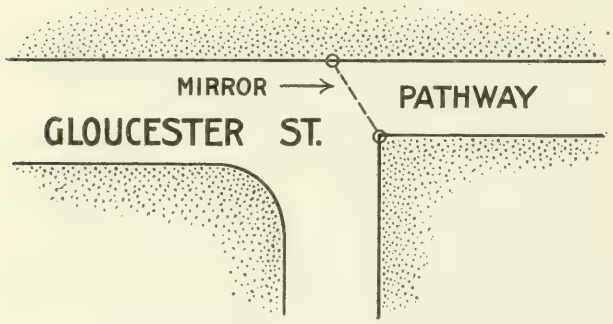


Samples of grain and vegetables, grown in our northernmost territory, have astonished the uninformed. From the reports made to the Department of Agriculture it appears that Alaska has some 20,000,000 acres—as large an area as the total farming land in Ohio—that are considered strictly agricultural land. Grain may be matured, hay, potatoes and many vegetables succeed in this region. The climate is said to be more favorable for farming than that of Finland, where over three million people live by that industry, and compares well with the climate of Sweden and of Norway, where agriculture thrives.

It has been found that berries and small fruits will grow well in nearly all sections south of the arctic circle, and that currants, raspberries and gooseberries succeed better than in the Eastern states. Rhubarb, cucumbers, cabbages and turnips have been grown at Coldfoot, sixty miles north of the circle.

Looking Glasses and Collisions

From old England comes a new device to avoid collisions at street intersections. A mirror is fixt on a building or supported on posts at such an angle that teams or automobiles may be seen approaching along either street.



In Folkstone a reflector or mirror, 24 inches square (cost about $7.50), is supported on a standard of 1½-inch gas pipe set in the ground at a crossing.

THE STREET MIRROR AT MALMESBURY

At Malmesbury a mirror has been erected on two pillars spanning a pathway at a dangerous turn. The engineers who set up these mirrors state that there have been no accidents at these corners since the mirrors were set up.

A slightly convex mirror is better than a plain flat one, as it shows a larger area.

NO COLLISIONS AT THIS TURN

The Artificial Age

This is an age of clever imitations, and the most artful of them all are the nitrocellulose products. The development of this field is recent and enormous in extent. One of the present problems of the nitrocellulose experts is the making of artificial human hair. Indeed they have already succeeded, but the product is a little too stiff and has too high a gloss. The outlook in this direction is most promising. Horse hair has been imitated very closely.

The chemistry of this wonderful substance is really very simple. Cellulose in the form of cotton or wood pulp is treated with nitric acid and sulphuric acid so as to form nitro derivatives. The most highly nitrated product is the powerful explosive guncotton, but the conditions can be arranged so that a less highly nitrated product results, which is not explosive. It is termed pyroxylin or soluble guncotton. Dissolved in a mixture of alcohol and ether it forms ordinary collodion, used for burns, in photography and for many useful purposes. Dissolved in camphor it is known as celluloid.

The pyroxylin lacquers, however, are at the bottom of most of the clever imitation products. Pyroxylin dissolves readily in amyl acetate and other solvents forming a lacquer which is much used in protecting metal surfaces from tarnishing. A little camphor is added in some cases. The "zapon lac," as it is often called, is an excellent adhesive and on evaporation of the solvent leaves a very tough film of pyroxylin. By its use the artificial leather industry has grown to an output of fifty thousand yards per annum in the United States alone and the demand is increasing rapidly. A cloth back is treated with a pyroxylin lacquer or varnish to which have been added a little castor oil and some coloring matter. It may be stamped to give any sort of surface and is rather strong.

Artificial feathers are among the latest pyroxylin triumphs. A cloth is covered with pyroxylin and sprinkled with finely shredded feathers or even cotton waste. After rolling, the fabric resembles eider down and is used as lining for cloaks or padding. Most ostrich feathers now are protected by a little pyroxylin. After dyeing and curling, they are sprayed with the lac, to which has been added some castor oil. This makes them impervious to water, and therefore washable and capable of much longer wear.

Pyroxylin deception in the fur industry means that common furs are made to resemble the costly silver fox, that the humble muskrat or raccoon is made to parade successfully as bearskin, and a dozen other tricks. The silver fox effect is obtained by "dabbing" common furs into japon lac containing a very little aluminum bronze. This puts a silver touch on the tips of the furs. When muskrat hides are treated with linseed oil and pyroxylin and brushed the wrong way, the hairs stand out straight like real bearskins. The most ornate wall paper is built up by pyroxylin coated fabric polished by calender rolls, embossed and possibly bronzed by some metal powder. Patent leather shoes owe their high polish to a coat of pyroxylin lacquer containing a black dye.

The very carpet under our feet may deceive us. Brussels is imitated now by sprinkling pyroxylin on burlap, sifting cotton or woolen waste on it and rolling. And the damask table cloth must be closely inspected in these modern times; it is probably not real damask at all. Any kind of a fabric covered with dissolved nitrocellulose worked up with castor oil for flexibility may be embossed by engraved rolls to duplicate the peculiar appearance of damask.

The greatest deception, however, may be in clothes. They are no longer what they seem. Shirting is given a silken luster by applying zapon lac and a very small amount of finely divided metal such as aluminum. Hosiery passes for silk, even with a watered effect, if slightly dampened with pyroxylin dissolved in some very volatile solvent and rolled between hot engraved rolls. The product resists the application of water.

The last touch of luxury may be found in brocade upholstery—a base imitation. Any woven fabric is moistened with gelatin and pyroxylin both dissolved in glacial acetic acid. It is next coated with a paste containing some pigment and cellulose ni-

trate with a little Venice turpentine. After drying a final coat is brushed on—a coat of amyl acetate lacquer containing some boiled linseed oil. The fabric may then be covered with leaf metal and a solution of alcoholic shellac to aid adhesion. After being painted, embroidered or printed it looks for all the world like the most elegant and genuine brocade.

Last and best known of these pyroxylin imitations is artificial silk, described and illustrated in our issue of February 27, 1913. Nitrocellulose in solution is forced thru a fine hole; on evaporation of the solvent a thread results. This is denitrated and spun into fabrics closely resembling silk, but more brittle, less durable and with a higher luster.

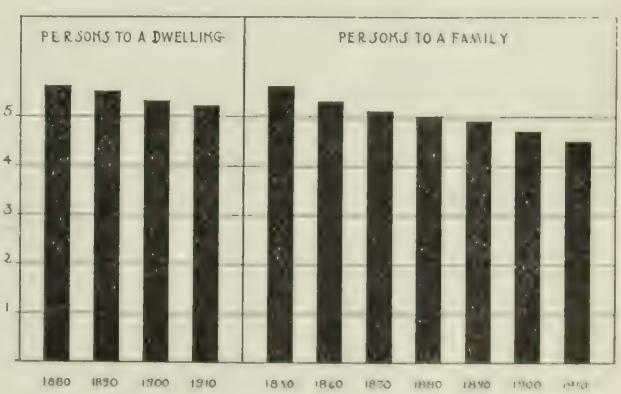
Women Doctors in Siberia

Not long ago a number of influential Siberians sent a petition to the Imperial Ministry of Education at St. Petersburg, praying that women be admitted to the medical faculty in the University of Tomsk, which serves the educational district of Western Siberia. It was pointed out in this petition that there exists in Siberia a wide field for women doctors. There are many Mohammedans in that country, and only women doctors are permitted to come to their assistance, since Mohammedans will not permit men to see their wives and daughters.

Many women have entered the medical profession in Russia proper, and there are a great many women practising dentistry, a department of surgery that does not seem to have attractions for the women of countries farther west. At Kharkov, in southern Russia, a University of Medical Science for Women was opened in 1910.



Houses and People

In census usage a "dwelling" is any building in which one or more persons reside, and a "family" is a household or group of persons, whether related by blood or not, who share a common abode, usually also sharing the same table. Thus, a dwelling is everything from a cabin to an apartment house, and a family may be one person who lives alone or an entire institution. The number of persons to a dwelling in the United States has decreased from 5.6 in 1880 to 5.2 in 1900. The number of persons to a family has decreased from 5.6 in 1850 to 4.5 in 1910. It is therefore apparent that most dwellings in this country are occupied by a single family. There are no statistics available for the census of 1910 to show the average size of private families. The average number of persons per dwelling in 1910 was largest in the Middle Atlantic (6.2) and New England divisions (6.0). This is probably due in considerable degree to the fact that these divisions contain a larger proportion of urban population than any other sections of this country, and it is in the cities that the large tenement houses are to be found. The number of persons per dwelling was lowest in the mountain division where it was only 4.5. The maximum number of persons to a dwelling was reached in New York State, where it was 7.7. Since over half of the population of the state is in Greater New York, this figure is not remarkable.

In the borough of Manhattan 30.9 persons are found on an average to a dwelling. This figure shows an increase from 23.0 in 1900 and is much higher than in any other city in the United States. In Chicago there were but 8.9 persons to a dwelling in 1910, in Philadelphia 5.2. In many cities, including New Orleans, Philadelphia, Pittsburgh and St. Louis, the number of persons to a dwelling has decreased during the last decade. The average number of persons per dwelling in the urban districts in the United States was 5.9 in 1910 and in the rural districts 4.7. Notwithstanding the fact that the cities have increased more rapidly than the rural districts in this country during the past decade, the average number of persons to a dwelling in the country as a whole has decreased.

On the other hand, the average number of persons to a family is slightly smaller in the cities (4.5) than in the rural districts (4.6). New England is the only section in the country in which the number of persons to a family was as high in 1910 as it had been in 1890. Bridgeport, Connecticut, and Providence, Rhode Island, are the only cities having 100,000 inhabitants or more to show a larger number of persons to a family in 1910 than in 1890.

MORE ROOM AND SMALLER FAMILIES

When Japan and America Coöperate

St. Luke's Hospital was established by the American Episcopal Church in Tokyo, Japan, twelve years ago. It is now the largest hospital in Japan under foreign control. It cares for needy Japanese thru its dispensary to the number of 100 to 150 daily. It receives native patients in the thirty free beds. Prominent Japanese, foreign residents and visitors, and the diplomatic corps use its facilities constantly; the Department of Communications has made it officially the infirmary for its 2000 employees in the city. From Singapore, Java, Hong Kong and Vladivostok come patients to testify to its international reputation. For not only is its service desired by natives, because it receives the coöperation of the best Japanese and the resident Caucasian physicians; but it is a necessity for the Americans and Europeans for whom inevitable differences between the best Japanese and European theories of hospital administration—diet, heating, arrangement —make comfort and well-being in native institutions difficult to secure.

Tokyo's two and a half millions are inadequately served by the present plant, a building of the maximum hight allowed by law, covering every foot of its present property, which is shut in on all sides. It is planned to buy a new site and erect a hospital on the approved pavilion plan, with ample accommodations for both free and paying patients and dispensary facilities for 200 cases daily. Imperative needs can be met with an expenditure of $275,000. Baron Goto, for the Japanese government, has pledged at least $25,000. An American council, headed by Honorable Lloyd C. Griscom, of New York, formerly Minister to Japan, is coöperating with Dr. Rudolph B. Teusler, the director, now in the United States, in collecting funds for this enterprise, which more than anything else at the present juncture would tend to avert the threatened breach of the historic friendship between Japan and the United States.

How the Monkey Grows Up

The young of all other mammals are born with far better motor and sensory endowment than the human infant. Many of them have the power of locomotion at birth or else gain it within a few days. Since their growth period is very short compared to that of the human child, they must either be born with such endowments as are necessary to enable them to get on in their way of living; or else they must hasten to learn what is needful for them to know.

Not many observations have been recorded on the infantile behavior and development of the group of mammals nearest to men, namely, the monkeys and apes. It is known that the young of the apes undergo a much slower mental and physical growth than do the young of monkeys. Hence in this respect they more nearly approach the developmental condition of the human infant. The observations made on the growth and behavior of a young monkey, born at the Johns Hopkins Psychological Laboratory, make a welcome and very interesting contribution to our knowledge. As the following account shows, the infant monkey showed no greater endowments at birth than does the human infant. But in the rapidity of his physical development and in his ability to acquire the responses necessary for his welfare the infant monkey rapidly outstripped the human infant.

Thus on the first day of his birth the young monkey clung to the ventral side of its mother, but frequently lost its grasp. Its mother held it in position constantly with one hand. It could open its eyes, but noticed or heard nothing and could not hold or turn its head steadily. This ability to cling is present in the human infant also at birth and persists when exercised. On the second day the baby monkey was able to cling to the mother unaided by her supporting arm. It showed some consciousness of sound. On the third day it began to look about and noticed moving objects. At five days it controlled its head fairly well and reached aimlessly at its companions. On the sixth day the young monkey scrambled to his mother's back while she used the flying rings. During the second week he learned to walk and to locate the source of sound. At three weeks of age he could carry objects accurately to his mouth and had much improved in walking. Also at this time he began to climb and jump and had perfected the act of scratching himself.

His first tooth was cut during the fifth week. At six weeks he shut his eyes when his mother slapped him and began to take solid food. During the seventh week he became very much interested in his own body, spending much time studying his hands and feet. At eight weeks his mother chastised him for eating some of her food. At this time he had cut all of his incisors. However, he still cried for his mother to help him in emergencies; as for instance, when he had climbed to the wire roof of his cage and feared to come down. He had acquired most of the vocal sounds of the adult.

At ten weeks the deep blue color of his eyes had changed to a dark brown, a change that requires much more time in the human infant. At fifteen weeks his canine teeth

were thru and he was cutting his molars. Thus this young monkey had accomplished in days and weeks what the human infant must spend weeks and months in developing and acquiring. "Many of the little monkey's activities," as his observers state, "appeared suddenly, apparently without preliminary practice, but others, particularly those requiring an adaptive response, were acquired only after many unsuccessful attempts."

Carnegie Station for Experimental Evolution.

A Great Monument to Jefferson

On April 30 St. Louis and the nation joined in dedicating the Jefferson Memorial in Forest Park, St. Louis. The memorial is both a monument to the memory of Thomas Jefferson, and a commemoration of the acquisition of the Louisiana Territory.

It has no counterpart in this country, and is indeed unique in design. The monument cost $450,000, exclusive of the ground, and of this amount the national government contributed $150,000. The cornerstone was laid two years ago.

A great memorial building is constructed of white marble, and is 400 feet in length and sixty feet high. Under an immense arch, the full hight of the building, stands the heroic statue of Jefferson. The arch is seventy feet deep, with a rotunda or dome sixty feet in diameter. The dome is artistically decorated with burnt tile in colors, and emblems of the state and Union.

THE NEW ST. LOUIS STATUE OF JEFFERSON

The statue of Jefferson, occupying the rotunda, is of masterful lines and overpowering size. It was carved from a solid block of Italian marble, which, when brought from the quarry, weighed forty-eight tons. The statue proper is the figure of Jefferson seated in a massive chair. This rests on a pedestal about ten feet in hight. The seated figure is nine feet high, giving the monument a hight of nineteen feet. Jefferson, according to contemporary documents, was six feet two inches tall. In his presentation of the figure, Karl Bitter, the sculptor, was guided by many conceptions of the man and has worked out a vigorous and, it is believed, a faithful portrait.

The Weight of Moving Crowds

The frequent reports of the collapse of temporary platforms and grand stands show that these are not always constructed with a sufficient margin of safety. They are calculated to support the dead weight of as dense a crowd as could stand or sit on them, but it is often overlooked that a crowd in motion, especially simultaneous motion, may exert a much greater strain, both vertically and horizontally. When a man who is seated rises to his feet he exerts, since action and reaction are equal, a pressure upon the floor equal to the weight raised, that is, the greater part of his body. This may be easily shown on an ordinary platform scale. If a person seated on the platform weighing, say, 160 pounds, gets up suddenly the indicator on the dial will record for the moment of motion a weight of nearly 290 pounds. According to the experiments of C. J. Tilden, reported to the American Society of Civil Engineers, the average increase of weight on the platform when one stands up is nearly 80 per cent.

That is not all, for in rising from a seat a person exerts a backward pressure of about 50 per cent of his weight. If he moves rapidly forward and then stops suddenly the backward and forward force exerted upon the platform may be 150 pounds or more. Now, it is common at a baseball game or races to see almost the whole crowd rise as one man and a simultaneous step backward or forward is very apt to occur. Such movements put a sudden strain upon the structure that it may not be calculated to bear. It is customary to allow three square feet of floor space for each person sitting and to assume that a standing crowd, however closely packed, will not weigh over 100 pounds per square foot. But this rule does not take into consideration the increase of pressure due to movements of the crowd, which, as shown above, may be very great.

Pebbles

Uneasy lies the tooth that wears a crown.

Cartoon of the Week

THE GENERAL EFFECT WAS VERY STYLISH
—F. Fox, in the Chicago *Evening Post.*

The quarter miler neared the tape,
And then as if by chance,
A button on his track suit broke
And made him lose his—race.
—*Stanford Chaparral.*

SOLICITOUS.

It was the self-made man's first dinner with the elite, and he was firmly resolved not to be outdone by any of the male guests in politeness. Having stuffed the end of his napkin in his collar, he started off by insisting upon squeezing a lemon upon the oysters of the lady at his left. The expression on her face convinced him that he must have made some error, so he mentally determined to redeem himself. The chance came when the soup was brought in—steaming hot. "Pardon me," he said to his victim, "but can't I blow your soup for you?"—*University of Pennsylvania Punch Bowl.*

Fifty Years Ago

From **The Independent,** June 11, 1863.

PUEBLA HAS SURRENDERED

We have at length authentic news of the surrender of Puebla to the French. The garrison held out to the last extremity, until both food and ammunition were exhausted. Disappointed in their expectation of being relieved by Gen. Comonfort, and hope being lost, they patriotically and heroically sacrificed the military punctilio to the interests of the country; and, instead of accepting a conditional surrender, they first destroyed all their guns, and then gave themselves up unconditionally as prisoners of war. Some of the Mexican officers are said to have committed suicide rather than surrender. Mexico needs the help of all her sons, and yet these brave men may have hoped that their example in dying rather than surrender may help to inspirit their surviving fellow-countrymen. The French have marched onward toward the City of Mexico, which is understood to be better fortified than Puebla, and will be defended to the utmost. And even if that should also fall a prey to the ruthless invaders, the loss of the capital itself would not now involve the conquest of the country. We have reason to believe that such a spirit of patriotic unity has now been excited among that people as can never be subjugated by an army from Europe. A guerrilla warfare, a retreat to mountain fastnesses, the desolation of the country around the invading forces, will exhaust and exterminate the enemy, and New Spain will be the fatal rock of the second Napoleonic dynasty, as Old Spain was of the first.

THE WEEK

The Tariff Bill

It is now said that the tariff bill will not be reported from committee to the Senate before July 1. A very long debate will follow. Among the speakers who will consume much time is Mr. La Follette. He has a complete bill of his own, and may take a week for explanation and defense of it. The committee proposed, last week, to adjust certain incongruities by imposing small duties on flour and meat. Mr. Wilson objected, and the adjustment was made by removing the House bill's duties on wheat and cattle. If Mr. Wilson favors the change, the preference of 5 per cent for imports brought in American ships will be dropt. It violates many treaties.

Examination of the Senators to ascertain whether there is a lobby and to what extent their private interests are affected by the bill has excited some interest, but the testimony has not been important. It shows organized effort, especially on the part of sugar planters and sugar refiners, to affect the legislation, but not in a corrupt way. The refiners want free raw sugar, and the planters would have the duty retained. Subpoenas for fifty or sixty persons named by Senators have been issued, and the inquiry will be a long one. Senator Townsend, of Michigan, asserted that the President had exerted more influence than all the so-called lobbyists. The nearest approach to undue influence, he said, had been the influence of Mr. Wilson and of the party secret caucus. There had been a kind of coercion. The committee decided to recall Senators and question them as to such influence as Mr. Townsend had mentioned. It is now expected that as a result of changes made by the committee, the bill, as reported, will show an average tariff rate lower than that of the House bill.

Labor Controversies

At the close of a long trial, William M. Wood, president of the American Woolen Company, accused of having conspired against the textile strikers at Lawrence, Mass., by procuring the planting of dynamite on the premises of several of them, was acquitted. As to the guilt of Frederick E. Atteaux the jury disagreed, but Dennis J. Collins, who had become a witness for the prosecution, was convicted.

In Paterson, Alexander Scott, editor of a weekly Socialist paper, was found guilty last week of writing and publishing an editorial article advocating hostility to the Government. Under a New Jersey statute, this is a crime. Scott has made many speeches in support of the silk mill strikers of Paterson. In his paper he reviled the police, calling them brass-buttoned anarchists. His sentence is an indeterminate one of from one year to fifteen years in prison, with a fine of $250. Thirty-eight of the Paterson strikers were convicted of unlawful assemblage. In a demonstration against one of the mills they had refused to disperse at the command of the police.

At Charleston, W. Va., on the 7th, indictments were found by a Federal grand jury against John P. White, president of the United Mine Workers, and eighteen other officers of that labor union. They are accused of having conspired with coal mine owners in Western Pennsylvania, Ohio, Indiana and Illinois to force an increase of wages at the West Virginia mines, by strike or otherwise, in order that it might not be possible for the mine owners there to compete with those of the states above named. These indictments caused surprise in Washington. The Attorney General had not been informed as to the proceedings, for which the local District Attorney, Mr. Waugh, was responsible. President White says the charge is absurd.

A special committee of the Senate is about to make an investigation concerning the strike at the West Virginia mines, and will go to the mining towns. The Socialist party's national committee finds Governor Hatfield innocent with respect to certain charges against him as to conduct in relation to this strike, but censures him for suppressing two Socialist papers. The committee sharply criticises his predecessor, Governor Glasscock.

Joseph W. Coldwell, who had charge of the strike at the Draper Company's mills in Hopedale, Mass., has been tried and found guilty of uttering menaces and sentenced to be confined three months in the House of Correction. He was the Socialist party's candidate for State Treasurer in 1911.

Arbitration Treaties Delayed

Several of our Government's treaties of arbitration have recently expired or soon will be terminated by limitation. Owing to opposition in the Senate, it may be difficult to renew them. On the 5th, after the Senate had voted to renew the agreements with Spain and Italy, the treaty with Great Britain was taken up. Senator Chamberlain objected, because, as he said, ratification would obligate the United States to accept arbitration for the controversy about Panama Canal tolls. To avoid any appearance of discrimination, the ratifications of the treaties with Spain and Italy were withdrawn and further action was postponed. On the following day, at another executive session, no progress was made, Eight Senators joined Mr. Chamberlain in opposition. They were Messrs. Borah, Bristow, Works, Pomerene, Newlands, Lewis, Crawford and O'Gorman.

Mr. Works said our Government was now seriously handicapped in its domestic affairs by a treaty obligation hastily assumed. The treaty with Japan greatly embarrassed sovereign states. Mr. O'Gorman said he would never consent to ratification of the treaty with Great Britain unless there was an amendment excluding the tolls question from arbitration. Because of the opposition shown, some expect the adoption of such an amendment, which would prevent acceptance of the treaty by Great Britain. It is feared that all the similar treaties are in danger.

The Dispute with Japan

Japan's reply to the latest note from our Government was received in Washington on the 4th. While the contents have not been given to the public by authority, it is understood that Japan still holds that the California land law violates the treaty, and also that is in violation of the Fourteenth Amendment to our Constitution, which provides that no state shall deprive any person of life, liberty or property without due process of law, or deny to any person within its jurisdiction the equal protection of the laws. Mr. Bryan had suggested that Japan should test the statute in our courts. This Japan declines to do, and looks to the United States for the action proposed. It is not expected that our Government will seek the test. It holds that there has been no violation of the treaty.

Mr. Bryan, with the aid of John Bassett Moore, Counsellor for the Department of State, is preparing another note. The Japanese Ambassador was present at a dinner given in Pittsburgh to George W. Guthrie, our new Ambassador to Japan. In the course of his address, which was highly complimentary to the President and Secretary Bryan, he said the two nations were destined to be brought into closer contact in all branches of peaceful activities. He did not deny that such contact was liable to give rise to occasional misunderstandings and complications, but he did deny the possible existence of any phase in those difficulties which would not eventually yield to due and timely processes of diplomatic treatment, the treatment of justice and fair play and of a sympathetic understanding of the problems of each nation by the other. The spirit of fair play had always guided both countries in dealing with international questions.

Japan has given formal notice to our Government that it accepts in principle the plan suggested by Secretary Bryan for the promotion of international peace.

Alaska

All the volcanoes along the Alaskan peninsula are in eruption. From one on Unimak Island flames are rising to a considerable hight. Others are throwing out smoke, a great volume of which is seen above the volcano of Katmai, which was in violent eruption a year ago, when the fertile island of Kadiak was covered with ashes. Volcanoes on the west side of Cook Inlet, also, are smoking.

As a result of the recent hearings before a Senate sub-committee, a bill appropriating $40,000,000 for the construction of railroads in Alaska will be submitted to the full committee by Senators Jones and Chamberlain. It provides that the money shall be used by a commission of five persons, under the direction of the President. The passage of such a bill is now expected, and it is proposed that the roads shall be built on the routes recommended by the Commissioners whom President Taft sent to the Territory.

Canada

Replying to questions from Sir Wilfred Laurier, Premier Borden said, on the 6th, that the Government would pay for the three battleships which the British Admiralty recently decided to build. This decision was reached after the rejection, in the Dominion Senate, of the naval aid bill, appropriating $35,000,000 for three ships. Mr. Borden remarked that he thought the Dominion Government now in power would have a majority in the Senate before the completion of the ships. Sir Wilfred challenged him to go to the people on the naval issue.

The House has voted to pay a cash subsidy of $15,640,000 to the Canadian Northern Railroad Company. Payments are to be made at the rates of $6400 per mile for the construction of 250 miles from Toronto to Ottawa; $12,000 per mile for 910 miles from Ottawa to Port Arthur, and $12,000 per mile for a line of 260 miles from Edmonton to Yellowhead Pass. The Opposition urged that the grant should be conditioned upon the establishment of freight rates brought down to the level of those in the East. It was shown that the Government had already guaranteed $58,000,000 of Canadian Northern securities, that $62,000,000 had been guaranted by the provinces, and that $145,000,000 had been issued without guarantee.

The Panama Canal

It is understood at Washington that R. L. Metcalfe, for several years editor of Mr. Bryan's *Commoner*, is to succeed M. H. Thatcher as the civilian member of the Panama Canal Commission. The Zone Government will not be reorganized until after the completion of the canal, and Colonel Goethals, chief engineer, is not to be disturbed. The question of the repeal of the exemption of our coastwise shipping from the payment of tolls will probably not be taken up in Congress until the December session. Repeal is said to be favored by the House committee. Robert G. Fowler, an aviator who recently passed over the canal in an aeroplane, said he ascertained that an aviator could easily cripple the canal by wrecking locks or the great dam.

The treaty with Nicaragua, of which we have spoken heretofore, relates not only to the old canal route and a naval station on the Pacific coast, but also to certain islands on the Atlantic side. These, which are leased by the treaty to the United States for ninety-nine years, can be so fortified that they will command the Eastern terminus of the canal. A commission appointed to settle claims of Americans for losses in Nicaragua's recent revolutionary disturbances is taking testimony in Washington.

South America

The plot for the assassination of Venezuela's President was discovered by General Corao, a capitalist, who was urged to join the conspirators. He refused to do so. A shot was fired at him while he was on his way to the palace, where he told President Gomez of his discovery. Dr. Baptista, a member of the Government Council, who fled to Curacao, was assisted by friends disguised as policemen. Those who saw him departing thought he had been arrested and was going to prison.

In Argentina, the six leading Anglo-Argentine chilled beef companies have said to the Government that they must go out of business if present conditions continue. Other companies, they assert, seek an absolute monopoly by selling beef in England below cost. The other companies to which they refer are those controlled by packers in this country. In May, two American companies sent to England 68 per cent of the beef exported to that country. The supply was excessive, and prices fell there.

While the visit of Dr. Lauro Muller, Brazil's Minister of Foreign Affairs, who will arrive at Norfolk this week on Brazil's largest battleship, is ostensibly made in return for Secretary Root's visit, some years ago, the purpose of it is said to be the promotion of friendly relations which were disturbed by our prosecution of the Coffee Trust. Dr. Muller, who has had a distinguished career, will make an extended tour, going as far as San Francisco.

More American capital was invested in Chili in 1912 than in any previous year. Americans bought a group of copper mines, iron ore mines, and the railroad from Antofagasta to La Paz. There have recently been popular demonstrations in several cities against Mgr. Sibilia, the Papal nuncio at Santiago, who was appointed in 1908, and the Government will be asked to procure his removal.

Under the auspices of the Pan-American States Association, one hundred young men are coming from South America to this country, where they will enter prominent factories, to become familiar with the industries and to assist the manufacturers in increasing their exports. They will also learn how to sell goods, and, later, in their native lands, will work for the expansion of United States trade.

For the Suffrage

Emily Wilding Davison, a militant, tried to seize the reins of the King's race horse, Anmer, at the Derby running on June 4. The woman rushed onto the track while the race was in progress, and succeeded in throwing the horse and jockey. The latter was hurt, and Miss Wilding died from her injuries on June 8.

The woman who threw her life away in this sensational manner was a graduate of London University, aged thirty-five years. She had been sentenced to imprisonment on eight occasions for obstruction, stone throwing and other suffraget performances.

Arson is again the order of the day and

various fires are blamed upon the militants, including one at Westwood, near Trowbridge, Wiltshire, of which the damage was estimated at $75,000.

Militant suffragets were in evidence at a lecture at Queen's Hall, London, on June 4, delivered by Commander Evans on antarctic exploration. Winston Churchill, First Lord of the Admirality, was interrupted in his eulogy of Captain Scott, the discoverer of the South Pole who lost his life returning, and ejections were made in order that the minister might conclude his address.

Lady Aberdeen, president of the International Council of Women, in session at Paris, declares her "merciless condemnation" of such "senseless acts" as Miss Wilding's at the Derby. A speaker at the congress, Madame Maria Verone, a lawyer, proposed, last week, that only those who were mothers should be allowed to talk and to vote. The suggestion amused her audience. But on June 5 a measure to compel employers to continue paying working women their wages in cases of absence owing to motherhood was proposed in the Chamber of Deputies, and aroused a lively debate. The deputy introducing the bill, M. Engerand, said that France and Turkey were the only European countries in which the mother is not protected. He stated that the death rate among children put out to nurse was sixty per cent against twelve per cent in other cases and urged the voting of his bill in view of the falling birth rate in France as compared with Germany. Another deputy declared that had France passed a measure of this kind twenty years ago the Chamber of Deputies would not now have to vote a law obliging Frenchmen to serve three years in the army.

The British Empire

Customs officers at Dublin seized on June 6 a consignment of 500 rifles and bayonets addressed to Baron Farnham, an Irish peer, at his country seat in County Cavan. Baron Farnham was formerly a British Army officer, serving thru the Boer War, and is a fervent Ulster loyalist. Only three days earlier the customs at Belfast seized 2000 rifles labeled "electrical equipment" and sent from Manchester. They were shipped "to order." Home Rulers refuse to take the news of these seizures very seriously, or to be alarmed by the Ulstermen's threats of civil war in case the British Parliament votes for Irish Home Rule.

Winston Churchill, First Lord of the Admiralty, announced that the Government would at once begin the construction of the three warships provided for in this year's naval budget: not waiting till March, 1914, as was originally intended. This Mr. Churchill explained by the Canadian Senate's rejection of the naval bill.

Sedition has been uncovered at Barisal, British India, and forty-four prominent Bengalese have been arrested. Ammunition and documents indicating a plot for a wholesale massacre of Europeans has been discovered. A strike is in progress on the South Mahratta Railway, originating at Bangalore.

General Schalk Burger unveiled on May 24 a statue of the late President Kruger of the Transvaal. This was in Princess Park, Pretoria. Lord Gladstone sent a message from London saying that all sections in politics were at one in honoring the memory of a distinguished man who gave his life's work to his country's service. General Botha sent a message saying that his Dutch fellow-countrymen, when they contemplated the simple patriot of iron will, deep piety and uncommon ability, felt their blood coursing quickly thru their veins. That personality also compelled the admiration of British-born fellow-countrymen. The ideals of the two races typified by Kruger and Rhodes must be brought into harmony, said General Botha.

The German Emperor's Jubilee

The German Emperor is celebrating the twenty-fifth anniversary of his accession. Twenty-five German rulers and many other distinguished persons throng Berlin, and the festivities include military, musical and gastronomic performances. On June 8 the Kaiser dedicated the Olympic stadium on the edge of the Gruenwald, the second largest stadium in the world, just completed at a cost of half a million dollars. This will be the scene of the 1916 Olympic games. It is said that the street decorations in Berlin have cost $300,000, and the jubilee seems to be occasioning more enthusiasm than the recent wedding of the Kaiser's daughter to Prince Ernst of Cumberland. The Kaiser has lavishly entertained the Argentine commission which has just left Germany for England, after spending ten days or more studying German industries. This commission is headed by Senator Salas. Germany stands second in trade with Argentina, having supplanted the United States; the Empire and its chief are now straining every muscle to forge ahead of Great Britain.

From June 17 onward six million jubilee coins, representing the Kaiser bareheaded in the uniform of the cuirassiers, will be issued. Kaiser Wilhelm has appealed to the von Stumm family of steel, iron and coal workers not to mine the iron ore beneath

the battlefields of St. Privat in Lorraine. This was the scene of one of the first engagements in the Franco-Prussian War, costing thousands of Prussian lives. The bones of many of the combatants lie in this ground, but the von Stumms decline to see the question from the sentimental standpoint.

Great disorders have marked a strike of workers in a chicory factory at Frauendorf, a suburb of Stettin. A pitched battle between the strikers and 300 policemen, who wielded revolvers and sabers, was reported on June 6.

The Reichstag's Budget Committee decided on June 4 that foreigners residing and making a living in Germany should be taxed under the new Military Contribution bill. The Socialist members failed to carry their proposal to tax possessions held in mortmain, and all church property. On the same date the dreadnought *Markgraf* was launched. The new battleship will displace 27,000 tons and is designed for a speed of 21 knots. She will have a heavy armament, including ten 14-inch guns, and is fitted with 10 submerged torpedo tubes.

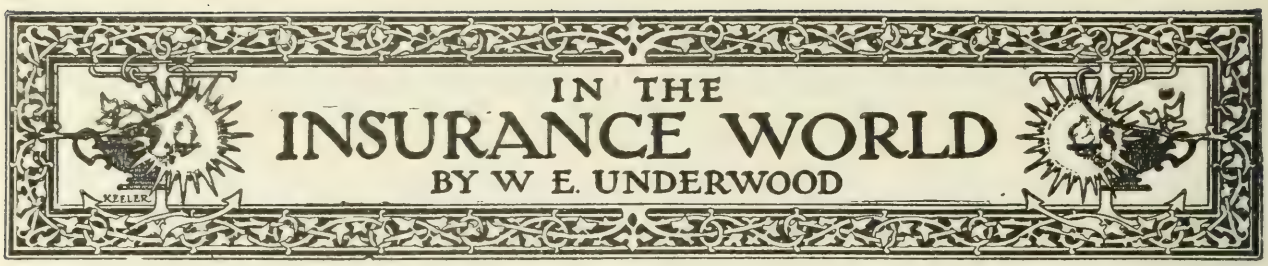
Paris Alarums

The Chamber of Deputies was greatly excited on June 2 by the bitter attack made upon the Chief of Staff, General Pau (a one-armed veteran of 1870), by a deputy named Chautemps. This was in the course of the debate on the bill reverting to three years' military service in France. Since 1905 two years has been the term. And the bill increasing the length of service has been under discussion since March 6.

The attack is strictly partisan. It is partly the consequence of the Government's inquiry into anti-militarist demonstrations by Socialists and Syndicalists. On June 2 and 3 the attack was renewed by M. Jaurès, the Socialist leader, and M. Thalamas, a fellow Socialist, and former professor of history at the Sorbonne, where his aspersions upon the character of France's national heroine, Jeanne d'Arc, enraged a large body of the students, and led to his dismissal.

It was reported last week that M. Touney, the veteran chief of the Paris municipal police, had been retired in consequence of a debate in the Chamber in which he was rebuked for prohibiting a demonstration organized by young radicals in memory of Jeanne d'Arc. It appears, however, that the students bore a wreath with this inscription: "Betrayed by a king and burned by the Church." The youngsters had little thought of honoring the heroine, and were intent upon politics. Therefore M. Touney denied them the streets by virtue of a police rule against permitting citizens to place wreaths on public monuments in cases where the inscriptions are calculated to offend certain classes, or to lead to disorder in the streets. The police chief will still continue to serve his country in his old position.

The report of the Army Committee of the Chamber of Deputies, rendered a fortnight ago, shows that at the beginning of the financial year in April, 1912, there was a deficiency of 819 infantry officers, 143 artillery officers, 55 engineer officers and 235 doctors. This problem is assuming disquieting dimensions, and at the military schools of Saint Cyr and Saint Maixent the number of candidates steadily diminishes in proportion to the number of vacant posts. The Ministers of War, Marine, and Finance have been authorized to prepare a bill to increase the pay of army and navy officers, now inadequate.



The French are making progress in Morocco, now occupying with native troops Tarudant, the capital of the Sus district, where the pretender to the Sultanate, El Hiba, was in authority after he retired from Marakesh in August, 1912. The pretender is in flight. Unrest among the mountain tribes in the Spanish zone has been increasing during the last three weeks, and attacks upon Spanish posts were reported on June 5.

Gold and silver holdings in French banks are increasing. Money continues tight. The French market is reported sound, however; in which respect the situation differs from that in Germany.

European Notes

The *Moniteur Belge* of Brussels announces the formation of a special commission, in accordance with the decision of the Government at the close of the late general strike, to take up the question of electoral reform. The commission has thirty-one members, including the leaders of the different parties represented in the Belgian Parliament, and is presided over by Count de Roodenbeke, Vice-president of the Belgian Senate. On May 28 the Belgian Parliament passed an army bill raising the national peace strength from 40,000 to 55,000 and the war strength from 180,000 to 340,000. The length of service in peace will range from fifteen to twenty-one months, and every Belgian over nineteen is liable to be called to arms, tho there are many exemptions.

Strikes of laborers employed upon public works in Portugal occurred last month in consequence of an order that they should be employed only three days weekly.

Professional Insurance Promoters

The professional promoter of new insurance companies, with his statistical records showing the large profits made by old and well managed companies transacting the same line of business, is still at large in the land and continues to impress the uninformed and inexperienced with the unlimited possibilities for achieving wealth in that direction by becoming stockholders in the new venture which he is endeavoring (for the commissions he is to make out of it) to put on its financial feet. Altho the investing public have been repeatedly warned by the insurance supervising officials of a number of states to exercise the greatest caution in their dealings with the promoters of new companies, and have been advised to examine carefully all the claims made by them respecting the possible profits, there appears to be no diminution in the number of such enterprises and no abatement in the claims and enthusiasm of their creators.

THE INDEPENDENT is lately in receipt of a letter from one of its readers in the West, enclosing a leaflet given him by a canvasser of stock subscriptions to a new $2,000,000 fire insurance company which is being organized in that section of the country, requesting that we read the representations made by the promoters and advise him respecting their truthfulness. We are informed by our correspondent that the canvasser has assured him "that on an average twenty per cent of the income of the leading companies pays all the fire losses, leaving eighty per cent clear gain," and that within the period of three or four years the new company will be paying its stockholders dividends of twenty-five per cent.

This is perhaps a fair illustration of the work which the professional promoter does. A more unblushing falsehood was never uttered than the statement that losses absorb but twenty per cent of a fire insurance company's income, leaving the remainder clear gain. It will be noted that the element of expense of operating has been studiously avoided. Let us examine the facts as we find them reported by the New York Insurance Department compilations of the business transacted in 1912 by the 183 fire insurance companies which are subject to the supervision of that department.

We find that the total fire premiums received last year by those companies amounted to $292,089,154, and that the total income was $344,352,562. The disbursements for losses aggregated $154,701,381. The ratio of losses to premiums is in excess of 53 per cent, and of losses to total income, 45 per cent.

The management expenses, taxes and other charges incident to the transaction of the business were $141,566,538. This, added to the losses gives us a total outgo for those accounts of $296,267,919, thus using up more than 100 per cent of the premiums and almost 90 per cent of the total income.

The New York Department report contains an "Underwriting and Investment Exhibit," an analysis of the sources and amounts of the underwriting and investment gains and losses of each company reporting. From this we find that the 183 companies, in 1912, made a total profit on underwriting of $8,617,904; that their gains from the investment side of their business aggregated $19,349,753; and that they made a total miscellaneous loss of $17,656,765. The difference is a net gain of $10,311,192. Thus we find that the "clear gain," so brilliantly painted by the promoters, dwindles to the insignificant proportions of 2.99 per cent of the total income.

We have here presented the general experience, the only facts that may be relied upon for the guidance of those who are ignorant of the subject. But the promoters avoid this method. They single out a few old companies of large aggregate assets; companies possessing highly trained agency plants of continental proportions which yield immense incomes; companies that are directed by the best brains and ripest experience in the business; and then make the claim to inexperienced investors that their little mushroom combinations can achieve like results. They remain silent as to the heavy periodical losses those same successful companies have suffered in the past; they conceal the fact that hundreds of companies have been wiped out of existence, not only by great conflagrations but under normal fire underwriting conditions; they say nothing of the millions of additional capital

which existing successful companies have been compelled to pay in to repair the ruin wrought by such conflagrations as those of Chicago, Boston, Baltimore and San Francisco. They fail to mention, for instance, that one of the companies, the success of which they never fail to cite and which they claim they can duplicate, was compelled to add $3,750,000 in cash to its funds in 1906 as the result of the heavy losses incurred that year at San Francisco.

The claim is not made that new fire insurance companies cannot succeed. They can. There is need of more than we have at present. Their organization should be encouraged. But it is folly to believe that the task is an easy one and that because a dozen or more old companies with large investment-earning powers pay good dividends to their stockholders, the new ones, without agency plants, business, investment-earning resources or managerial talent can do the same thing. The business at its best is a perilous one for capital, especially during a company's early years. Stockholders should put away the idea of early dividends, even small ones. They must be content to wait. In this matter the insuring and investing public are warranted in exercising caution, and in requiring substantial evidences of worthiness from new fire insurance companies before buying their policies or stock certificates. Those which are capitalized for a million or two millions and employ professional canvassers at heavy expense to secure subscriptions to the stock are, to take the most favorable view of the matter, impracticable. Success is not to be won by an establishment of such large proportions at the beginning. It is the small local company, the organizers of which are known and trusted in their city or state, and which for many years will be content to grow strong on the business in that section, that the fates which preside over the destinies of the fire insurance business regard with favor.

Examination of the General Accident

An examination of the financial condition on December 31, 1912, of the United States branch of the General Accident Fire and Life Assurance Corporation, Limited, of Perth, Scotland, of which C. Norie-Miller, 55 John street, New York City, is manager, has recently been completed by the Insurance Department of New York. This company confines all its operations in this country to the various lines of casualty insurance.

Compared with the company's report of the same date to the department, the investigation just concluded reveals some substantial differences. The examiners value the assets at $92,957 less and the total liabilities at $261,399 more than shown in the company's report, a net decrease of $354,356. The department's valuation increases the unpaid losses and claims $83,818; it increases the reserve for unpaid liability losses $129,829; increases the unearned premiums $73,847; and decreases the total of all other liabilities $26,095.

These variations are the result of rulings by the examiners principally in respect of the proper reserves to be maintained against all unpaid losses and claims, and are somewhat actuarial in character.

The net difference in the two balance sheets, however, is substantial, causing the surplus for account of policyholders to decline from $582,080 to $227,724, a sum which is $22,276 less than the statutory deposit. Since this result was worked out by the department, the Home Office of the company in Scotland has remitted to the United States branch the sum of $268,456, which brings the policyholders' surplus to $496,180 and the net surplus (treating the deposit of $250,000 as a liability) to $246,180.

The Proposed Life Insurance Tax

Admitting that the Government has the right under the income tax section of the tariff bill to tax life insurance companies, Mr. Ralph W. Breckenridge, of Omaha, chairman of the Insurance Committee of the American Bar Association, adds, "the only question is as to whether or not it is a wise thing to do." Perhaps the Government has the right to tax anything if the courts will subsequently sustain it in the collection thereof; but the authors of the bill have admitted in its provisions that the Government is not justified in taxing moneys handled by assessment and fraternal life insurance associations and mutual fire insurance companies. After that, the advocates of taxation of life insurance funds are, by all the rules of reason and consistency, estopped from proceeding. As we have repeatedly asserted, all life insurance moneys are expenses, and we do not understand that the cost of a citizen's living is to become an object of taxation. The measure as now proposed would bring in for a small share of governmental tribute, each, all persons carrying life insurance whose incomes are less than $4000. As Mr. Breckenridge asserts, the bill may not specifically place a tax upon each policy, "but by taxing the company itself upon its net revenue it really adds to the burden of the man who is paying for the individual policy."

FINANCE & TRADE

The Market for Securities

There was activity in the Stock Exchange market, last week, accompanied by a notable decline of prices. Transactions amounted to 2,888,635 shares, against only 1,046,000 in the week immediately preceding. Prices fell from the beginning, and the decline was due mainly, at first, to sales from Europe, where the bankruptcy of our Frisco railway system had caused anger and alarm. On Wednesday, Attorney General McReynolds's suggested plan of imposing supertaxes on the Tobacco Trust companies sharply affected the securities of those companies. Disapproval of this plan, together with the fall of securities directly concerned, depressed the entire list. Selling from Europe continued, and the prices reached were the lowest in five years. Before the end of the week there was a slight recovery, but the net losses were heavy. For the three stocks in which 40 per cent of the business was done—Reading, Union Pacific and Steel—they were about 5 points. In several other stocks there were greater declines, especially in the shares of the tobacco companies. Mr. McReynolds's plan was regarded as an indication that the present Government was inclined to impose discriminatory taxes upon large corporations.

The Frisco bankruptcy is to be investigated by the Interstate Commerce Commission, and there should be a searching inquiry. This has been demanded in the House by Mr. Hinebaugh, of Illinois, and in the Senate by Mr. Kenyon, of Iowa, whose resolutions were referred to committees. The adoption of them is not required to hasten an investigation, however, for the Commission has already taken up the work. Bondholders here and abroad call for such an inquiry. The entire railway system of the United States has suffered in the estimation of European investors on account of this failure, and the prices of the securities of all other American corporations have been affected by it.

This bankruptcy was added to a group of depressing causes at home and abroad, and was followed by announcement of the new tobacco tax plan. In Europe, war has destroyed property, been accompanied by great expenditure and caused hoarding of capital. At the same time there has been a great demand for capital, not only to be used in peaceful operations, but also in preparing for wars. The demand has largely exceeded the available supply. Evidence that borrowers must pay high rates has caused some liquidation of old investments in order that money may be released for more profitable new ones. There has been liquidation at other money centers, but much of it has taken place on the New York Stock Exchange, because that was the best market.

Government Deposits

Three banks in New York City have surrendered their deposits of Government money, being unwilling to pay the interest of 2 per cent which will hereafter be required. They are the National City, the National Bank of Commerce and the Chemical National. Similar action has been taken by four banks in other parts of the country—in New London, Conn.; Savannah, Ga.; Buffalo, Wyo.; and San Francisco. The amount thus surrendered is about $1,500,000, which, with the $10,000,000 recently added to the total, has been distributed among banks which desire to become depositaries. The number of the banks holding Government funds has been increased from 559 to 607, a majority of those added being in the South and West. The reason given for surrender has been, as a rule, that, owing to expenses accompanying the deposits, the interest charge left no profit, or not enough to pay for the work that must be done.

State Rates and City Bonds

The State of New York sold, last week, $27,000,000 of short-term notes. There were sixty-two bids, amounting to about $36,000,000, and the average interest to be paid (for less than one year) on the sums awarded is about 4.86 per cent. There was one bid of $10,000,000 at 4.85. A bill recently signed by the Governor permits bonds to be issued at 4½ per cent, instead of the old rate of 4 per cent. There will be an issue in March next. Baltimore offered $5,500,000 of 4 per cent city bonds last week, and the bids amounted to less than $600,000 at an average price of about 90.

The Brook

Have you seen a brook lately? Do you know of one anywhere about; where one may go of a tired hour, or a vacation morning, and hear it sing? How it *will* sing, monologs, lullabies, or a chorus here and there among the pebbles. It can talk forty languages. It can prattle here like a dozen children; and there it can speak in masculine words, or can gossip femininely where the water rounds a pretty bunch of celandine. This brook can work as well as talk, and it stops to turn millwheels, or grind sod off the banks and make new meadows for the grasses. It is busy all night around the corn roots, soaking the soil and feeding hills full of young potatoes.

It has found a smooth plate of rock, and spreading itself out for a quiet slide down hill, it jumps grandly when the edge of the rock is reached. It has its small Niagaras up in the glen, or down in the pasture, as it pleases. The big beech tree, standing by the roadside, tries to block the way, but the brook finds a way among the roots, until the tree stands on its toes; and the water dodging thru, comes out laughing and joking on the other side.

It has a rich life of its own, this beautiful brook of ours, and society that it chooses. Minnows play everywhere in tiny pools; too small to tempt the angler, but nibbling at the schoolboy's toes, when at noon he eats his lunch; or snapping the crumbs that fall from the slices of bread and butter.

There on your bank we picked mints; spearmint and peppermint, and in an elbow we remember a big bunch of horsemint. Where the gravel was plentiful, there the celandine grew up in big patches, with its orange flowers, and its seed-pods that snapped funnily. But everywhere were bunches of blue-eyed forget-me-not. Oh, that we might give up the big world, with its windy prairies and no brooks, and just spend one hour each day on the gravel and the shale, where the brook sings its hundred songs, and the Victor-Victrola is neither called for nor needed. Who was ever lonesome with a brook for a companion?

They say that somewhere up the swale, where the hemlocks make a cool, deep pool, there are trout, and these will take bait only before sunrise of a June morning. Ah, well, it is just as well that there are few people up at that time of day, and so the pool will not be untenanted faster than trout can be spawned. It is a silent spot, where for a few moments the brook cools itself among the ferns, and we hear the blackberry pickers on the hillsides that lean over with shadows.

But there is one thing of which you may be sure, that the brook will never keep quiet long, unless it dies. It will always be doing something; it will always be going somewhere. It will always find out the news, and always carry it on thru all the world. That is why it joins its neighbors, and makes one out of two, so that you cannot tell them apart. Then they will run on together, gossipping and gabbling, and filling all the village with talk. They try to get thru the pipes that the plumbers have laid, and into all the kitchens and the dining rooms. You would not take it for the same brook, but it is.

Starting away up in the glen, where

it stops awhile to play with the ferns, the brook ground the hill farmer's wheat; boiled the potatoes and filled the tea kettles of the factory workers; and now it is washing the clothes of the village housekeepers. But this is not all of it—not by a great deal. Everything and everybody must nowadays come to what they call efficiency, and our little brook that darted out of a hole in the woods is no exception. Somewhere on the hill slope Farmer Scott built a dam, and right there frolicking must cease, only it did not.

The dam was built of stone, that for awhile had been a wall, before stock laws made these needless; but wild strawberries had crept up over the ends of it and mushrooms grew plentiful where the spray kept moisture around an old butternut stump. When the dam was full the brook dashed over, and it was just there that brook power became something else. Our farmer never found out just what this new thing was, only we called it power, and while the brook dashed on we harnessed the power for work. We carried it down to the big barns, and there it was set to cut feed for the cattle, and to saw wood; and it washed all the stables and the yards; and finally it milked the cows, and did everything not only swiftly, but well.

Somehow the brook was not laughing as much as it did, but it had its fun and lots of it, for there is no real joy like that which comes from work. It was making everything sweet and clean, and the farmer boys who used to be overworked, now came around laughing and praising the brook, and when their wits were well wakened they began to be cleaner themselves, and threw away their cigarets. There was a revolution going on in more ways than one, and it was the brook that did it. The milk that went to the house was cleaner and more sanitary. At the house the cream was churned into butter by the same power; butter as yellow as gold, and as delicious as it was wholesome. Here the housewife chimed in with smiling face, and clapped her hands with the new music of work. When somebody charged the brook with being made a slave to progress, it only whistled back that it had got to be the master of the whole farm.

O beautiful brook! You washed our feet in our schoolboy days. You sung to us later when as a man we plowed your banks. You positively refused to leave the old meadow and you wound around the apple trees, where in the old Goodsell orchard the Pound Sweets fell with the Spitzenburgs, into your pools. Sixty years we have been separated. The sun and the winds went with us, and the clouds dropt down their rain on the prairie lands. The flowers were there and the birds sang to us, and it would seem that one should be happy in such a land. But no brook was anywhere about, tumbling and singing, playing and working. We missed you sadly, little brook, and now once more we will come back to New England, the mother of brooks. We shall lie down for awhile on the sod and listen. We want to know if you are singing the same songs that you sang sixty —seventy—years ago. We shall call back old days while we live new ones. Already we smell the mints and the wild clovers. The catbirds are here singing and scolding, and the grosbeaks dip down to wash themselves, just where they did, under the arching roots of the beech tree. Yes! it is indeed true that the brook in the field and the mother in the house are the two things that wind themselves closest about the boy's heart; and it is these two that he will long for to the end.

The Constitutional Way Will Win

That the people of the United States, politically organized under the Federal Constitution, are a bigger and stronger combination than any state or confederation of states, was settled by the Civil War. That the same combination is a bigger and stronger corporation than any private or quasi-public corporation, or trust of corporations for business purposes, is day by day being demonstrated by reactions of public opinion to events with which the Federal courts will be called upon to deal, and to decisions of the Supreme Court upon questions that already have been pondered by the court of last resort.

To speak first of the reaction to decisions: Nothing could have been more offensive to the newspapers—the so called organs of public opinion—than the

newspaper publicity law requiring them, if they would enjoy second class privileges in the mails, to disclose circulation, editorial control, ownershp, and names of known bondholders. They have accepted the decision against them and are complying with the law, not only in act, but also in self-respecting respect for the court which has disappointed them, and for its opinions.

Mingled here and there with disappointment, here and there with apprehension, an approval sincere and nation-wide has been accorded the Supreme Court decision in the Minnesota railway rate case. In this case the whole question of the supremacy of the constitutionally organized people over corporations of their own creation was involved; because the issue was not the abstract right to regulate, but was the determination of authority to use ways and means, and the limitation, if any, upon its application. The decision seems to establish four things: (1) That as a practical proposition, all state regulation of railroad business is subordinate to Federal regulation; (2) that the power of Federal regulation resides in Congress; (3) that the Federal courts will not act in regulation where regulation is the business of Congress; and (4) that states may regulate until Congress acts, but their action must not be confiscatory.

Assuming that further decisions will be consistent with the principles here set forth, a broad and commonsense policy of railway control is indicated. Capital invested in railways is safe and will earn reasonable returns. Secured against confiscatory legislation, railroads must serve the public efficiently and reasonably, and will be made to do so by a power which it would be idle to resist. Furthermore, the public served will be the whole American people, not merely the people of any one state or section.

The industrial struggle in West Virginia has brought up the old question of the fundamental constitutional rights of individuals, but not to reopen it. The question was settled a hundred years ago and was settled right, as the West Virginia mine operators, militia officers, mine guards and miners, one and all, will learn. The public is not yet in a position to say who has been most guilty in the wretched business. It is charged that the mine owners of Pennsylvania, Ohio, Indiana and Illinois, hard prest by West Virginia competition, conspired with officers of the United Mine Workers, now under indictment, to bring on trouble. The charge remains to be proven. It is certain that men have been sentenced by military commission, and committed to prison without due process of law. The revelation of this fact acknowledged before Senator Borah has called forth instant and unreserved condemnation from the press of all political parties. No state in the Union will be permitted to set aside the constitutional guarantees of liberty, whatever the provocation.

The American people has devised and successfully applied a constitutional way of dealing with the troubles endlessly arising from conflicts of interest in an energetic population. That way we shall adhere to and abide by.

The New Haven Railroad Company

Two fast express trains on the New Haven road were approaching New York, last Thursday afternoon. The first stopped, near Stamford, to substitute electric power for steam. While it was stationary, the following train crashed into it, wrecking and destroying its last car, a flimsy wooden structure, in which there were twenty-five passengers. It was a parlor car, and the passengers had paid an additional price for their seats. Six of them were killed, and all of their associates were injured. This collision took place in broad daylight, at about 5 o'clock in the afternoon. In the last two years there have been thirteen serious accidents on the lines of this company—five of them on the road between New Haven and New York—and in these accidents forty-nine passengers have lost their lives.

An official investigation concerning this rear-end collision at Stamford is now in progress, and the witnesses do not fully agree. It does appear, however, that the engineer of the following train, Charles J. Dougherty, was not properly qualified for the position in which he had been placed. This was a fast express, regarded as one of the best trains in the company's service. It was drawn by a

very heavy and powerful locomotive, and the engineer should have been one qualified by experience. But Dougherty had served on other and less important passenger trains for only a few days, had been engineer of this train only three days, was not familiar with the type of locomotive which he was required to control, and had little knowledge of the route over which he was passing. It is asserted, and also denied, that he ran past two danger signals. After the signals had been past, he attempted to stop his train by applying the air brakes. They would not work. Two days earlier he had reported that they were ineffective. His predecessor had found them so, and had been suspended for running past a signal. Dougherty attempted to reverse his engine, but could not do this because he was physically unable to move the lever a sufficient distance. He is not a strong man, and he had sprained the muscles of his back in a previous effort of the same kind. It also appears that the wrecked wooden car was hastily taken from the scene of the collision by direction of the company's officers, and that the remains of it were destroyed by fire before the coroner could examine them.

Such a man as Dougherty should not have been placed in charge of that locomotive and that train. If, as it is asserted, his assignment to the train was required by union rules (which the company had accepted), the company should have rejected those rules and should have asked the public to support its action. There should have been no wooden cars in the train. All of the cars should have been of steel. No locomotive equipt with ineffective air brakes should have been in service.

The company is an old and well known one. With the subsidiaries acquired in recent years it controls the passenger and freight traffic of the New England States. In the past for many years it paid large dividends. The rate is now 6 per cent, the latest reduction having been made a few days ago. In a decade the price of its shares has fallen from 225 to 99¼. Owing to its recent acquisition of railway, trolley and steamship properties, to its long list of accidents, to its interest in state legislation, and to prosecutions by the Government, it has been the subject of much discussion and has excited much unfavorable criticism.

We did not think that the suit of the Government for violation of the Sherman act in the acquisition of the Boston & Maine was warranted by the facts. Eventually the Government took this view of the matter and dropped the case. The company's purchase of numerous trolley lines does not appear to have been hostile to the public interest, so far as service and rates are concerned. The steamship purchases may have been in violation of the Sherman act. We were unable to commend the recent prosecution, undertaken on account of negotiations with the Grand Trunk. The company's officers were accused of suppressing competition which had never existed. But while, in some of these transactions, the conduct of the company may not have been in violation of the Anti-Trust law, it has been shown, by recent investigation, to have been objectionable on other grounds.

Reaching out for everything in sight thruout New England, it paid too much for what it acquired. This is true especially of its purchase of trolley and steamship lines. Some of the facts brought out by official investigation we recently considered in THE INDEPENDENT. A great bonded debt was created. It began to appear that the energies of the company's controlling officers were devoted to the acquisition and the financing of the new properties, and not to the management of the main lines of road. Accident after accident, falling dividends, curiously complicated accounts, and the results of official inquiries have confirmed in the public mind this view of the company's conduct. The collision at Stamford is regarded as additional evidence that the corporation is sorely in need of reform.

In our judgment, this prevailing opinion is a just one. The demand for reform is one that should be forcibly made by the stockholders. It should be addrest emphatically to the directors. If the stockholders fail to take steps for their own protection, or if the directors take no action, the governments of the New England States, by their railroad commissions or by legislation, should act. As for the commissions, it is their duty to be on guard continually for the public.

The national commission may, and doubtless will, take part in the movement. The bankruptcy of the Frisco system was a blow, at home and abroad, to American railways. The recent history and present condition of the New Haven Company is also discreditable to the railroads of the United States, as a whole. We hope to see this company saved by thoro reform.

The Senatorial Investigation

When a criminal trial is before a court one may follow, as the jury follows, the evidence, and may be approaching a conclusion, but one prudently withholds a verdict till the case is all in. A committee of the United States Senate is investigating the conditions in the coal mines of West Virginia, and it is proper for the general public to hear with the committee the evidence on both sides and hold judgment in the balance, or at least in suspense, until the committee makes its report.

Yet it is hard to withhold the tentative judgment that there has been very great wrong on both sides. One has a natural inclination to judge the strikers harshly because they are led by the Industrial Workers of the World, an organization which is controlled by men who preach violence, who organize sabotage, and whose business is not to make peace but war. If the principles of the I. W. W. mean the overthrow by violence of organized industrial society, one is from the beginning ready to believe and expect men to begin and conduct a strike with violence. Governor Glasscock and others declare in their evidence that the violence and intimidation were of such a nature that the courts were unable to do their duty, and that it was necessary to call in the militia and declare martial law; and that the arrest and trial and conviction of scores and even hundreds by military courts was necessary.

On the other hand, this is denied. It is declared that the courts were in unintimidated exercise of their functions. We are told that men and women were imprisoned illegally, treated shamefully, and even that from an armored train rifles and machine guns were fired at night into a camp of striking miners. If half the tales are true the miners were treated with a merciless indignity such as might characterize the Kongo or Putamayo atrocities. It is hard to believe that there is not truth in these sworn reports. If half or a quarter of them are true the investigation is justified. The crimes in Kongo have been stopt and the association organized ten years ago to make investigation and arouse the angry sentiment of the world has dissolved, its work done. We thank the Senate for putting this searchlight on the darkness of West Virginia. The lawlessness, the violence of the strikers, spurred by leaders from abroad, has, it now appears, been criminal; but lawlessness in the guise of law, courts in league with wealth against labor, injustice baptized with the fair name of law, is worse than the mad passion of ignorant, malevolent revenge. We have had barbarism in Western Virginia, and we shall be surprised if the committee does not find barbarians on both sides. Let the probe go deep; let the foul and vile ulcer be fully explored, and we may expect that public sentiment, and some necessary legislation, will make the recurrence of such a strike impossible. We expect nothing from the I. W. W., but we do expect that somehow an agreement may be made that will secure industrial peace with protocols and arbitration boards acceptable to both parties. The present condition is intolerable.

The Franking Privilege

Attention is called to the abuse of the franking privilege by the testimony given to the Senatorial committee investigating the charge by the President of the existence of an insidious and mischievous lobby. It seems that those who are seeking to maintain a tariff on sugar have been able to distribute their literature for popular instruction by means of the franking privilege given to members of Congress. This is no new thing, for it is always done. There is no cause that will not find Senators or Representatives supporting it, and who will readily prepare speeches in favor of it, and include therewith other documents, and then give their frank for distribution. That is accepted as perfectly legitimate. Several Senators have thus been frank-

ing sugar documents, and it is said that Senator Lodge, whose state is not particularly interested, allowed one issue of 320,000 copies to go out under his frank.

There is an evil here that ought to be corrected. It is perhaps right that members of Congress should be free to send out documents free to their constituents, but the amount should be limited. It would be much better if each member were allowed a certain number of postage stamps limited to his own personal use. This amount should be liberal, but not extravagant. At present it is absolutely unlimited, and strange stories are told of furniture and laundry sent by mail. But the worst abuse is in the extravagant dumping into the mails of documents for selfish and business purposes.

We would have stamps thus assigned to congressional correspondence, and equally to the executive and judicial departments. The Post Office Department would be easily self-supporting if it did not have to carry so much franked matter. The bureaus and departments at Washington should receive stamps of various denominations from the Post Office Department, and this department should charge the amount, and should have the credit for the service it does for other departments, just as it is credited with what it does for private individuals or corporations. Perhaps this scandal—for it is nothing less—may lead to a reform.

The Disappointments of a War Correspondent

The suicide of Angus Hamilton, the English war correspondent, on June 14, because his lecture on the Balkan War did not give him money enough to pay his board bill, lends emphasis to what is said by Mr. Marvin in this issue on the difficulties of reporting a modern campaign. Many of those who flocked to Sofia and Constantinople at the outbreak of the war were obviously incompetent and deserved their failure, but Mr. Hamilton was an experienced man. He had seen service in Korea, China and India, had been thru the Boer and Russo-Japanese wars, and in the recent conflict had an unusual opportunity to see both sides, for while he was attached to the Turkish army, he was captured by the Bulgars and condemned to death as a spy. Still these remarkable experiences, even tho illustrated with moving pictures, failed to interest the American public, which tired of hearing about the war long before peace was concluded. In the future there will not be such eagerness on the part of newspaper men to go to the front, now that the opportunities for observation have become so restricted and the rewards have become so insignificant and uncertain.

Is the Apostles' Creed Inspired?

It is a fault of most of the efforts for Church union that they attempt first to set down a set of conditions which those entering the union must agree to, and that basis usually a confession of Christian faith. The basis chosen in a proposition now being presented to various denominations is the Apostles' Creed. That creed has great excellences and serious defects, but why choose it? Is it inspired? Has it any Apostolic authority? Not the slightest. It is old, but not as old as that. Age gives it no authority, and we could certainly make better creeds nowadays, and have made many.

The Federal Council has a creed of its own; and the Young Men's Christian Association has a creed which binds its members, and the Methodist Church has Wesley's sermons for creed; but again we ask, Why have a creed? These creeds are supposed to be based on the Bible; then why not take the Bible as creed? Is it because the Bible is so big a book? Not so much bigger than Wesley's sermons. Is it because it would be possible on that basis to take in any good Christian, since any good Christian can find his authority somewhere in the Bible? Then so much the better, for why shut out any good Christian? The days are past when we can properly shut the doors against disciples of our Lord. It would be vastly more reasonable to make confest discipleship of Jesus the basis of union than any creed, even the loosest that disciples have ever written.

We are led to these remarks by observation of the discussion among the denomination which says it is not a de-

nomination, denominated the Disciples of Christ, over a proposition coming to a number of their ministers from the Episcopal Church Unity Foundation, that they consider union on the basis of the Apostles' Creed; and also by the reassertion of their creed by the late convention of the Y. M. C. A. This creed is called the Portland Basis, and was adopted forty-four years ago. It is good enough, as creeds go, good for the time, but theological science has made some progress since then, and it could be improved. Six years ago a committee of fifteen able men was appointed to report amendments, and this year it made a report signed by the chairman, President Mackenzie, of Hartford Seminary, and all but one of the fifteen, recommending that the creed be dropt, and that membership of any recognized evangelical Church be the only test required of members. One would expect the fourteen to carry the convention, but the one lone committeeman won the day. They were afraid the Y. M. C. A. might seem to be weakening in the faith.

No large union can come in the future based on intellectual beliefs, such as an apostle says that devils can honestly assent to. The basis of union must be Christian character, not any man's standard of Christian doctrine. We must agree to differ, and agree to love and serve.

The Troubles of the British Ministry

It takes three stages to make a bill into a law in Great Britain, when the Lords refuse to accept the bill as it passes the House of Commons. During the preceding week the Irish Home Rule bill has past its second stage, having been for the second time adopted, after its rejection by the Lords.

Every effort is made by the Unionists to prevent its reaching its third and final passage by the Commons. One of these attempts appears in violent threats that if enacted it will be resisted by the Protestants of Ulster. They swear that it will not be submitted to; Ulster will fight it; Belfast will refuse to pay taxes and the attempt to collect taxes will be met with rifles. To prove the sincerity of this threat rifles are being sent to Ulster, and at least three cargoes have been confiscated. They are actually pledging themselves to treason and battle. And these are men of title and position and wealth, who accuse the nine-tenths of the Irish people of lawlessness and the design of unjustly ruling and robbing them. We cannot believe that when the bill becomes law, and Ireland has her own Parliament, just as every American state has its legislature, this small minority of the Irish people will resist both the Irish and the Imperial Parliament. It would be farcical.

An indiscretion of members of the Asquith Ministry has put another weapon into the hands of its enemies, and very eager they are, by fair means or foul, to gain its overthrow. Altho the committee of investigation has exonerated members of the Cabinet of any corrupt action, the British people have no occasion to be quite satisfied. Sir Rufus Isaacs advised Mr. Lloyd-George to buy American Marconi shares on a speculation for a rise, and he did so, at the same time that the Postmaster-General was making an important contract with a British Marconi company. There was not a bit of corruption in it, all agree; but it was indiscreet to speculate in anything bearing the Marconi name, not to speak of the indiscretion of speculation in general. The Unionists have made so much talk about it, and spread so many slurs and insinuations, that it has given the Asquith Government a black eye, and the Unionists actually hope that in some division it may be defeated and be obliged to dissolve the Parliament for a new election, before home rule for Ireland will be accomplisht in 1914.

Meanwhile one or two by-elections have shown Liberal losses, due largely to dissatisfaction with the working of the Pension act, an act which, however, a succeeding Unionist Government would not dare to repeal. A new election would probably support the present Government, but by a reduced majority. Then the Irish Home Rule bill, and the Welsh Disestablisment bill would have to begin again at the beginning, and it would take three years more to enact them, and with a Parliament less favorable to them. We should like to hear a frank apology

from Mr. Lloyd-George for his blunder, which we hope will be the last for which the present Cabinet, which has been quite too reticent, deserves credit; for no Ministry in present memory has been responsible for so many great reforms.

A War Lord's Jubilee

Only great and distinguished men have jubilees, but they may be great men in a small circle, and they are pretty sure to be men who like to be féted and flattered, for a jubilee is gotten up chiefly to flatter a living man. A modest man can generally escape the bore of it. One who stands all the time in a blaze of glory, like a king or a bishop, may expect and welcome a jubilee in his honor.

Emperor William II is an able and a very busy man. He could not and would not avoid a jubilee. He believes himself set by the grace of God to rule, and to tell his people what to do and what to believe. He is the one shining example among monarchs who believes that he rules by the grace of God and not by the will of the people. He believes in God and himself as the dual providence of the world. Accordingly, in his piety toward God and himself, he holds it his duty to rule, as God rules, for the welfare of the world. He deserves the full credit of being, like God, benevolent within the sphere of his rule. He loves Germany, and particularly Prussia, and will make them as prosperous and glorious as he can.

So he teaches them war and peace. He fosters business and the arts. It is the high claim of glory for his reign that for a quarter of a century Germany has had no war, that altho surrounded by enemies on all sides rapaciously eager to attack her, he has so ringed his imperial borders with Krupp cannon, and behind them such a dense cordon of muskets, that the world has been kept at bay. If the best way to keep the peace is to make bayonets as thick as porcupine quills, to create the most perfect army machine the world has ever seen, then William II is the veriest dove of peace that history has to show.

It has worked. He has had peace. And in peace a nation of scholars in the material arts, in every theory of production, with schools that lead the world, has enjoyed a period of business prosperity in manufactures and in commerce. Peace and science, not war, have gained this prize, but Krupp and Dreadnought give the praise to War and the War Lord William.

> The many rend the sky with loud applause;
> So War is crowned, but Peace has won the cause.

The world has a great respect for Emperor William. He is a patriot. He loves his Germany. He would give his life to make her glorious. He has an intense purpose. He believes not much in liberty, but he believes in God and himself. Great purpose is great strength. He holds to blood and iron. The world is getting over his doctrine of government and the offensiveness of his scheme of defense. He has burdened Europe with a mad rivalry of armaments and taxes and debt, until it can bear no more. Even wealth refuses to loan further. Just now China can borrow money easier than Germany. The people will rule, not kings.

Volunteer Martyrdom

The difference between a madman and a martyr is not all in the cause. The cause for which a martyr dies must be noble, and the sacrifice must be worth while. The Swiss who cried "Make way for liberty," and grasped to his breast the armful of pikes so that other brave men could pass thru the broken ranks, was a hero and martyr. Liberty was a worthy cause, and he sacrificed himself so intelligently as to make his death worth while. If Winkelried had run his breast unsupported against a single pike it would have been the foolish act of a madman.

Emily Davison's cause for which she died, the political liberty of woman, was a good and worthy one, for which one might well give up life; but there is no reason to show that hers was an intelligent act when she rushed onto the racecourse and tried to seize one of the horses, perhaps that of King George. The act had no relation to the cause she wished to aid. Christian martyrs of old did not seek martyrdom, or if any did their claim was denied. Her act was, like smashing of windows with hammers,

or the burning of buildings, a violent interference with the peace of society. Hers, like all these, was the act of one possessed with the mob madness. It lacked sense. It could not help the cause. That is not the way in which the suffrage victory was gained last week in Illinois. Our suffragists are not maddened suffragets; they use their intelligence. While they would be ready to be martyrs if there were need, there is no such need, and they will live out their natural lives in their homes, and not in prisons.

It is declared that the British women voters of another generation will erect a monument to the cause, which will represent Emily Davison's headlong rush to grasp the bridle of a galloping horse. Possibly, but it will represent the foolhardy act of a woman excited in a good cause to the limit of insanity. We have heard much of religious insanity, often ending in suicide. Brooding over the best of causes can drive one insane, and the suffrage is no exception. The path to martyrdom is not by the way of suicide.

The Balkans and Turkey

We exprest the wish that the Powers of Europe which are in a special way responsible for Turkey and the victorious allies might forbid Bulgaria and Servia to engage in war over the division of the territory taken from Turkey. We are glad that Russia, as a Slav nation has taken on herself this duty, and has asked—we may say, required—the two minor nations to adjudicate their differences. We take it that a refusal would not have been safe. Angry as Servia is, because she is not immediately allowed to retain all that her armies have captured, and indignant as Bulgaria is that Servia should be unwilling to stand by the terms agreed upon before the war, neither wishes to engage in a second fraternal and bloody strife, and each will gain a large accession of territory.

While the world is indignant at the idea of war between the late allies, it is a feeling of pity that goes out to Turkey in her continued misfortunes. The assassination of Shevket Pasha, the Grand Vizier, is not so surprising as it is sad. Turkey is in a most alarming condition. A humiliating defeat in war of a very proud nation makes half-educated people desperate. There are those who lay all the disasters to the Young Turks, and would have the good old days back of the imprisoned Sultan. Then there are quarrels in the ranks of the Young Turks, themselves; and the murder of Shevket is the act of revenge for the killing of General Nazim Pasha. Shevket was a vain adventurer, who came to the top in the upheaval which followed the defeats of Kirk-Kilisse and Lule-Burgas, and he promised to reverse the tide of misfortune and save Adrianople. He failed miserably, and his death is the price of failure.

The future of Turkey is dark. There is no clear evidence that the promises of two years ago will be fulfilled. The revolution has been followed by war with Italy, and then by the loss of her European provinces. Now the European Powers are preparing to divide into spheres of influence the territories of Asiatic Turkey, England and Germany dickering over Mesopotamia, Russia with her army encamped on the eastern borders, France coveting Syria, and British Egypt watching the rebellions in Arabia. Another massacre of Christians will be the signal for intervention and division, and it may come any day.

In Brief

The East is going to the West for advanced ideas on education, as the country learned when a large delegation from Pennsylvania, led by Mayor Blankenburg, of Philadelphia, lately inspected the activities of the University of Wisconsin. An example in another direction is set in the splendid plant of the new high school at Kenilworth, Ill. The buildings are constructed on the group plan. The auditorium, dining and dance hall, gynasium, natatorium and shop are all one story in hight and consequently, it is believed, panic-proof. The buildings were planned with the idea that they should serve as community centers as well as schools. The school grounds cover sixteen acres.

It is not pleasant to learn that our soldiers in the Philippines have been obliged to attack the Sultan of Jolo in his stronghold and destroy it and subdue him. Will some say that this is a good reason for quitting the Philippine Islands? Not at all. Such a fight is a mere police raid to arrest

marauders who were robbing and killing peaceable farmers. They have to be suppressed. If we were to leave the islands to the rule of the Christian Filipinos they would have the same trouble with the Moslem robbers and pirates, and would have a much harder job of it.

The anti-suffragists have boycotted the Rev. Anna Shaw, and declare that no one of them will ever enter in a public debate with her because she is irresponsible and has insulted them. What offends them was said in an address before the Senate's committee on Woman Suffrage: "We do not fear that little band of professional anti-women going around the country advocating home, heaven and mother. The only purpose they serve is that by holding out their skirts they act as a screen for the liquor traffic, the gamblers, the vicious and those interested in dance halls and places where young girls are ruined." That means that the saloons and the vice resorts generally are opposed to woman suffrage, which is true, and Mrs. Shaw said it rhetorically. We think she can stand the boycott.

It is enough to make one's ears tingle with pride and hope to listen to Secretary Bryan's address on Flag Day on world peace. He expects the Senate to renew the arbitration treaties with Great Britain and Japan. He said: "Only this morning I received assurances from the Empire of Japan of its desire to renew with the United States its general arbitration treaty. Before next Christmas I am expecting that at least twenty-five nations will have concluded with this country treaties by the terms of which controversies which cannot be adjusted otherwise may be referred to a disinterested international tribunal, this practically insuring peace and justice between us and all of the great nations of the world."

The decision of the Supreme Court in the Minnesota rate cases permits a state to determine the rates for intrastate traffic, provided that these rates are not confiscatory. But it also establishes the paramount authority of Congress with respect to all measures affecting interstate traffic, and virtually suggests Federal legislation. There is need of legislation, but reports from Washington indicate that there is no inclination to make new laws on this subject. Interstate traffic and rates should be clearly under Federal control. A state's regulation of the intrastate business of a road that traverses several states may seriously affect the road's interstate business.

Dr. Carrel, head of the Rockefeller Institute for Medical Research, is visiting Paris, and in a lecture there he says that surgeons can now open the chest to treat its organs as safely as we have been able for a few years to open the abdomen to perform operations of laparotomy. He also says that in such operations the heart can stop beating for ten minutes and be revived. Already as the fruit of this research the kidney can be kept alive in cold storage for months. Possibly one of these days a heart kept in cold storage may replace one that has to be removed, who knows?

One after another with great regularity the police grafters in this city have been convicted, but now comes a halt in the case of Police Sergeant Duffy. Eleven of the jury had no difficulty in finding him guilty, but one obstinate juror made as a reason for holding out that he would not take the word of a nigger witness against a white man. An important witness against Duffy was a negro waiter. Of course it never occurred to the prosecution in the examination of jurors to learn that this conscientious juror was a Southerner.

The lists have just been published of those who past the examinations of the tripos of Cambridge University. In the department of medieval and modern languages eight women gained first-class honors, and only six men. In the second class there were twenty-four women and eleven men; while in the lowest third class there were eight women and thirteen men. Again it recalls the Oxford limerick:

> I have spent all my cash in a crammer.
> And I shall get Beta or Gamma;
> While that girl over there,
> With the flaming red hair,
> Will get Alpha plus easily, damn her!

Polo is a game for wealth, and we wish every rich man would play it. It teaches courage, enterprise, skill. It gives force and ambition. It is better than dawdling in ladies' halls and cultivating divorce. We have a physical respect for the men who won for America, and the men who lost, the victory last Saturday which saves once more the polo cup for this country. It is a soldiers' game, and the British champions were soldiers. But once more peace has her victories, as she always should, over war.

When a Senate committee, with members from suffrage states, has prepared and hopes to report a bill for an amendment to the Constitution giving the right of suffrage to women, it need not be taken very seriously. It is little more than a farce, and we doubt if it will ever be reported.

Do the Filipinos Need Independence?

Views and Interviews of a Journalist Just Back from the Islands

By Albert S. Crockett

[One of the most important questions now before the American people is the threatened alienation of the Philippine Islands. In order to decide what our policy should be it is necessary first to find out as much as possible about what has been done in the Islands. Has the American administration been of benefit to the Filipinos and would its continuance be advantageous to them and to us? For the purpose of throwing light upon these questions we have secured a series of articles written from various points of view. In our "Tree Number" of two weeks ago we published a description of the forest wealth of the Philippines, and on May 22 we called attention to Filipino athletics. During the next few months we expect to publish articles on the schools, sanitation, administration, agriculture and religious work of the Philippines. In the following pages Mr. Crockett tells what he saw and heard during a recent visit to Manila and a brief but comprehensive tour of the Islands. Mr. Crockett has for the last fifteen years been flying around the world supported by a lead pencil like a witch on a broomstick and has served as foreign correspondent for the leading New York papers. For the illustrations we are indebted to the Manila Bureau of Science.—EDITOR.]

Had I attempted to summarize the situation in the Philippines soon after I arrived in February, I should have had to portray conditions similar to those that existed in the eastern part of the United States during the panic of 1907. Last year's crops were bad. Business was practically paralyzed. The bottom had dropped out of real estate. Men who had been about to put money into new enterprises were hurriedly running to cover, and some of the more timid who had actually invested were selling out and getting away as fast as they could.

Lots of what local residents regarded as "fine propositions" were going for a song. Money was dear, and unobtainable except upon security that was absolutely gilt-edged, and this in a country where, except in those "unchristian" provinces directly under the supervision of the Philippine Commission, there is no legal rate of interest, and twelve, eighteen and almost twenty-four per cent must be offered to tempt capital out of the stocking. As the fourth of March approached, the slightest prediction from home as to whom President-elect Wilson was going to have about him for advisers was eagerly seized upon and dissected. Every pronouncement of Mr. Wilson's was scanned closely for some indication as to his attitude toward the Philippines. The Jones bill and the agitation for Philippine independence, which people out here were looking at on a magic lantern screen, were the one topic of discussion. As one prominent American here put it, that document had "instilled the fear of hell into their hearts," and investors told you that "scuttling" the Philippines, as they call the Jones intention hereabouts, would mean the inevitable loss of millions of good American dollars.

After traveling among the Islands, going as far south as Zamboanga and Jolo, I found people in Manila talking more hopefully, but still waiting anxiously for President Wilson to say something. Otherwise, conditions remained about the same. Business was not going ahead. The *politicos* were still talking independence and looking for American sovereignty to be withdrawn any day, and it is said that these gentlemen, who, like some other politicians, have a horror of earning their bread except by the sweat of somebody else's brow, have already apportioned the offices that now exist and that may be created.

As a Democrat, I came out here with an open mind. These islands have had almost fifteen years of Republican supervision. What has been accomplished in the way of physical improvements, citizenship and enlightenment? I desired to know. What was this demand for independence, whence did it originate, and just how strong was it?

In my first glance shoreward as the "Manchuria" neared the breakwater off Manila, I got an object lesson—a concrete example of the sort of thing that had been accomplished here in a physical way by American initiative and enterprise, and—however much we of graft-ridden New York may scoff at the term—thru American good government.

WHAT THE UNITED STATES IS DOING FOR PHILIPPINE ROADS
This first-class macadamized roadway was built by the Bureau of Public Works.

Rising in the distance above a plain was the low, gray wall of the Manila of the Spaniards, built 350 years ago. Its moss-covered side not only marked the sea front of the town, but the limit of progress of the country toward civilization after three and a half centuries of Spanish rule. The breakwater that gave Manila a harbor, a fine piece of engineering and construction work that would compare favorably with that of Dover, at which so many Channel-crossing Americans have gazed with envious admiration, was put there by Americans. But this was not what made the whole appeal. Back of a fine permanent sea wall, which stretched as far to right and to left as the eye could take in, was a big area of land that had simply been scooped as mud from the bottom of the Bay and dumped there to such a breadth that the old Spanish wall was left far inland. Here was enough ground to support a new city, absolutely "created" out of the water, with modern docks, and bearing huge concrete structures that would do credit to our richest city, and hundreds of years in advance of that old Spanish wall.

In going about the city I saw an American trolley line doing a tremendous business, and helping in the development of suburban real estate. American policemen were standing at congested corners calmly regulating traffic. I saw schools and hospitals, run along the most modern American lines; a model prison that has accomplished results that might amaze the governors of our penal institutions at home. During my travels in Luzon and the other islands, I have seen miles and miles of good roads that would put the supervisors of thorofares in the states of New York and Connecticut to shame. The road from Manila to Lucena, which only four years ago was in parts a morass, would delight any automobolist who had ever tried to steer clear of the ruts along the Boston post road between New York and Stamford, Connecticut. I have seen great modern American lumber and sugar mills converting Philippine products into world necessities, and employing thousands at wages they never could hope to get before. I have seen beautiful government buildings in provincial capitals. I have seen "taos" who look as if they had just climbed down from the cocoanut trees and left their tails behind them being taught not only to work, but how to live. Every American industrial plant in the islands is a school of hygiene, and the details of the instruction some of these people have to receive as to habits of personal cleanliness would upset a deli-

cate stomach. A further enumeration would prove wearisome; but, in short, I have seen modern enlightenment coming out a winner after fifteen years of grappling with the savagery of thousands of years, and the fictitious civilization grafted upon its back by the Spaniards.

The agitation in the Philippines for independence was started and is being carried on by the *politicos,* who, as a rule, have little to lose in any event, and all to gain in case the islands are handed over to the Filipinos. For the most part, these *politicos* are persons who have received a smattering of education; just enough to make them feel that they ought not to have to work with their hands. Numerically they constitute a small class, tho by their oratorical powers and their threats they are able to wield an influence all out of proportion to their number and their importance. Most of them are to be found in the larger cities.

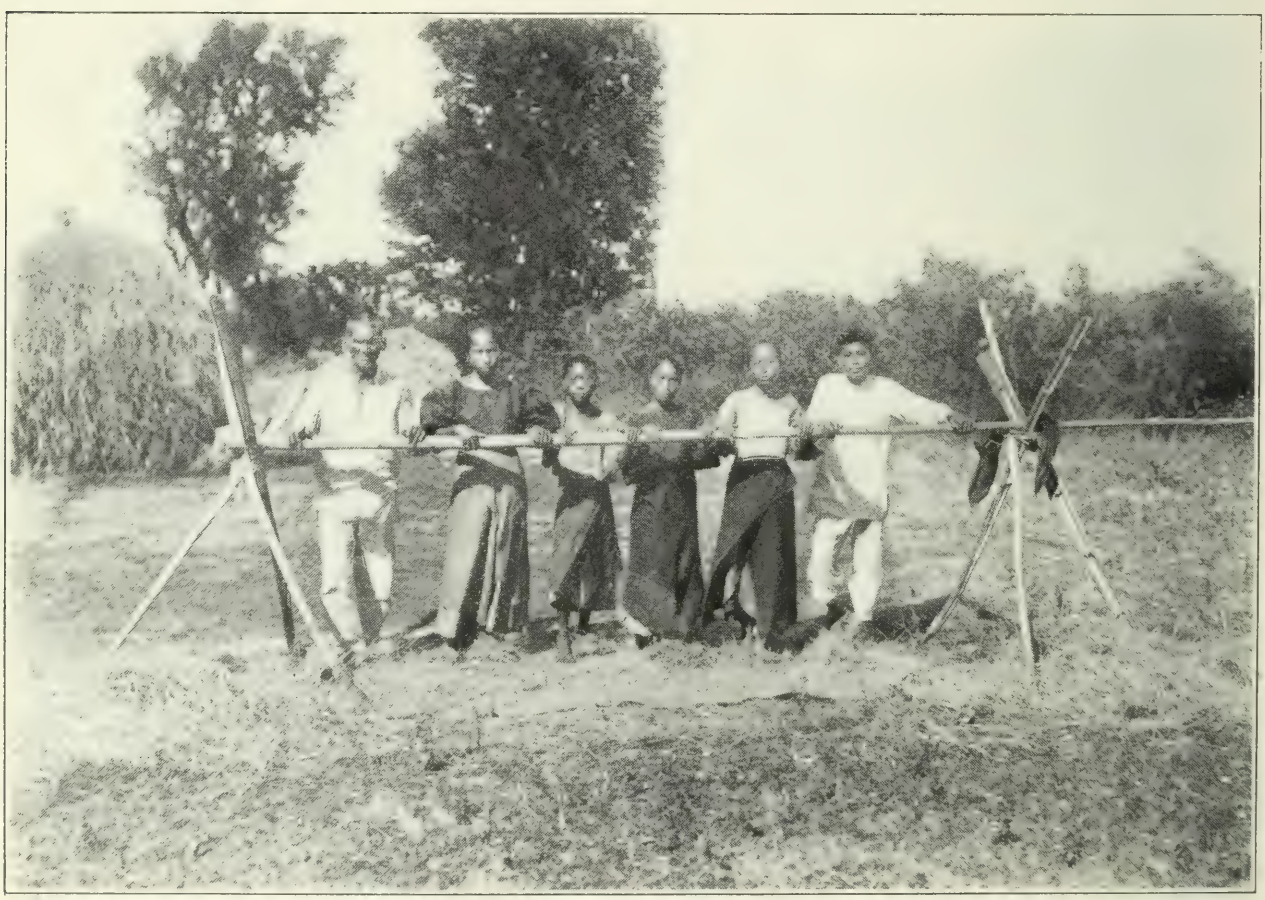
The head man of a fishing village, Pulupandan, on the coast of Negros, told me there were no *politicos* in his community, and that people did not want them about. "As long as the pueblo (municipality) is satisfied, the people in the country about are content," he added, "and our pueblo is not dissatisfied with present conditions."

Americans who have traveled about in the various islands tell the same tale about the influence of the *politico,* and the feeling of the working population and the *hacienderos,* or farmers, toward them. The voting class in the islands is very small, and most Filipinos still don't know anything about the right of suffrage. The Spaniards, of course, neglected to instruct them. Governor Vicente Lukban, of Tayabas Province, who is credited with having campaigned for his office with a claim that he had shed more American blood than anybody else in the Philippines, was delivering himself to me on this subject the other day at Lucena.

"Of course," he admitted, "we are a lot better off under the American rule. In Spanish times we had no politics, we were not allowed to talk; one was apt to have his head chopped off if he did. Now there are no more *caciques.* A

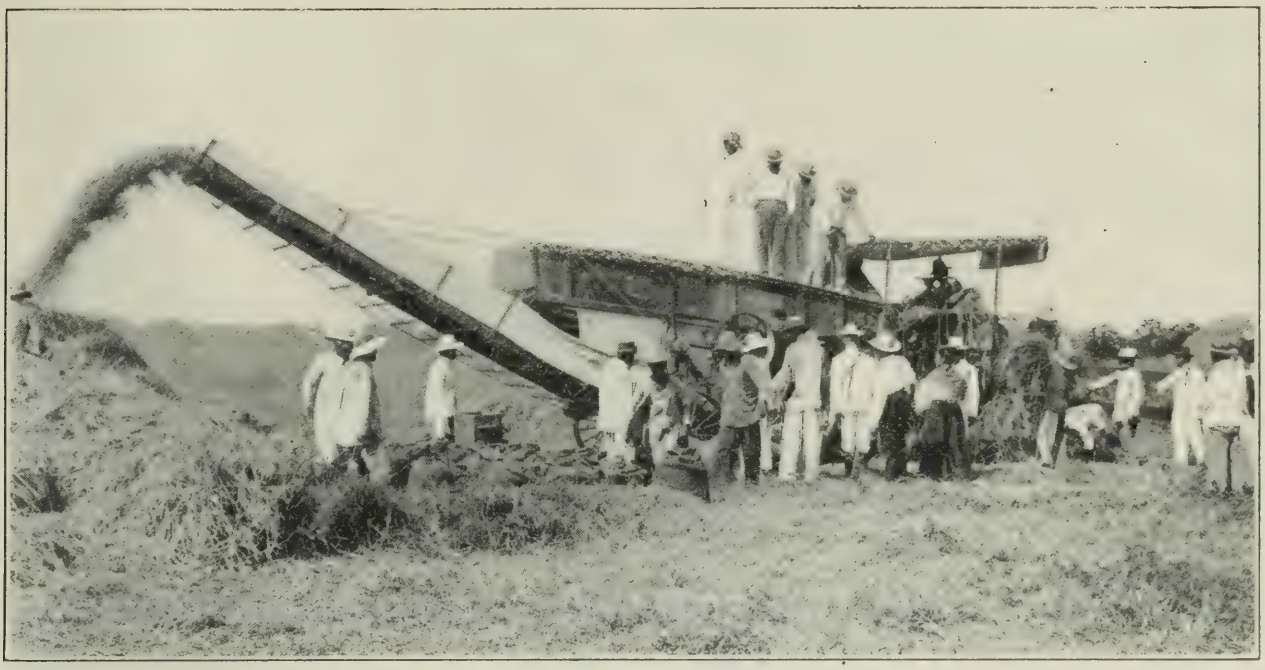
SANITATION BY MACHINE

The government squad is disinfecting unsanitary native houses during a cholera epidemic.



Filipino, under the Spaniards, could not hold any public office except that of justice of the peace."

If you talk with a Filipino who owns property of any value, he will seldom admit that he is anything but an *independista,* if he thinks there is any chance of what he says getting to the ears of the *politicos.* If he is interviewed in the native papers, he is apt to spout away at great length about "oppression" and "just rights" and "glorious liberty." Americans who have lived among them say they tell a different story when among friends. They live under constant fear of what the *politicos* may do to them, their families or their property, should they be heard uttering sentiments of disloyalty to the "cause." Government officials tell of scores of them who talk loudly of independence when they are among their own people, and then slip in by the back door to tell the Americans not to think seriously of what they had just said, and that they had just been compelled to talk that way to keep their *haciendas* from being burned. You can easily get filled up with such instances in Manila, where the *politico* is in his element. Let us travel to some of the islands south of Luzon.



Walter A. Smith, editor of the Iloilo (Panay) *Enterprise-Press,* and a Democrat from Kentucky, told me he had obtained personal statements from 200 prominent Filipinos on the subject of independence, and that, with the exception of the *politicos,* none of them wanted it.

George B. Linden, general traffic manager of the Philippine Railway Company, on the Island of Panay, has spent the last fourteen years in the Philippines, and as he has charge of the agricultural educative work the railroad company is trying to accomplish among the natives, in order to provide bigger crops to be hauled, he has been brought into close contact with the people.

"The average Filipino does not want independence," said Mr. Linden, as we were traveling across from Capiz to Iloilo in the "parlor car" attached to the limited express. "The *haciendero* has no use for the *politico,* whom he regards as merely a leech that he has to sup-

THRESHING RICE BY FOOT POWER
This is a squad of threshers twisting the rice under their feet in the primitive way.

THRESHING RICE IN THE AMERICANO FASHION

This machinery was introduced by Americans in 1903. On the top of the steam thresher are the three native governors of Pangasinan, Bulacaan and Nueva Ecija, who were skeptical and wanted to see the inside of the machine. They didn't believe that rice could be threshed so fast, and thought the tricky Yankee had stored rice inside to deceive them.

port. The real Filipino says, 'In these days we can get justice. We go to the *Americano* judge, and the man who harms us is punished.' The only persons in these islands who are clamoring for independence are those who want political jobs."

J. Clayton Nichols, general manager of the Negros-Philippine Lumber Company, at Cadiz, Island of Negros, has lived thirteen years in the Philippines, of which time he has spent eleven years in this island. Having all that time been an employer of labor, and speaking the native lingo, he has had unusual facilities for gathering opinions.

"I know personally every prominent native in this island," Mr. Nichols told me when I saw him the other day at Capiz. "Their attitude toward independence is decidedly against it. As for the others, they take no interest in politics, and are perfectly content with the existing order of things."

"Independence," Mr. Nichols went on to say, "would not have much effect upon such industries as are established in the Islands, but there would be a sharp clash between the political factions, and possibly war between the tribes. The masses could not hope to enjoy the liberty they possess today. The big men would oppress the people. The *hacienderos* are afraid to say openly that they do not want independence, for fear of what the *politicos* might do. All I have talked with privately are dead against it.

"The editor of the native paper at Bacolod told me that he would not stay here twenty-four hours after independence was declared. He added: 'The only people in the islands who want independence are the *politicos*, and the only reason they are after it is to get political jobs. People with property do not desire it; they are contented with the present government. Furthermore, if we should have independence, in a short time, owing to the native hatred toward them, a Japanese or a Chinese would be sure to be killed. A demand would be made for indemnity larger than we could pay. Then they would send warships and take this country.

" 'If the Japanese had this country,' the editor added, 'in my opinion no Filipino would be allowed to hold any office above that of sergeant of police. As matters stand now, we have the Supreme Court Chief Justice, the Attorney General, several members of the Commission, and a majority of the provincial officials.' "

J. H. Taylor, resident manager at Cebu for one of the biggest commercial

concerns in the Islands, has visited almost every town of any size in the Archipelago during the course of his work since he has been living out here. Mr. Taylor says that numbers of wealthy Filipinos have told him that if independence came they would dispose of all their property immediately and quit the islands.

"A native friend of mine told me not long ago that he was in favor of immediate independence," said Mr. Taylor. "Since Aguinaldo issued his manifesto that with independence the Tagalogs would take the government into their own hands, my friend has changed his mind. He came to me the other day and said he believed independence would be a dangerous thing."

F. P. Williamson, a North Carolinian who is running a successful lumbering plant at Port Banga, Zamboanga District, Island of Mindanao, has been living in the Philippines most of the time since he came out here with the Astor Battery, in the early days.

"The average Filipino does not want independence," said Mr. Williamson. "It would be too dangerous for those who want peace. Datto Mandi, the biggest man among the Moros in these parts, is against it. He says if the Americans turn the Islands over to the natives, the result will be that the various tribes will soon be waging war upon one another."

When I saw Datto Mandi himself the next day at Jolo, he confirmed the impression Mr. Williamson had given of his attitude, and volunteered the information that if independence were granted, the Moros would start in slaughtering the Filipinos who live in Mindanao.

From Señora, the widow Belzunce, a Spanish lady who, with her two young sons, runs a general store at the *embarcadero*, or port, for Binalbagan, on the river Binalbagan, Island of Negros, and who, besides, conducts a sugar exchange and warehouse and incidentally owns four *haciendas* in the neighborhood, I gathered a view of the situation from a new angle. The Señora has lived about thirty years in the Philippines.

"There are no *politicos* hereabouts," she told me. "The country would be lost if independence were granted. It would be impossible to live here. I speak as a Spanish woman and one who loves her country, and I will not refer to what is past, but I tell you if the Filipinos were left to themselves they would go back to savagery."

Among the more prominent natives I have interviewed are Governor Manuel Roa and Ex-Governor Dionisio Jakosalem, of the Province of Cebu. Both say they are in favor of independence. Señor Jakosalem served two terms as Governor, and he and Governor Roa are regarded as among the best types of men in local politics. I quote the former literally.

"Nobody in the Philippine Islands pretends to seek political independence without the supervision of the United States," said Señor Jakosalem. "We don't want absolute independence. The party which is working in the Islands now, for political reasons, desires the Islands neutralized."

Said Governor Roa, when asked if the Filipinos are ready for independence. "Very much so, taking into consideration the relations we would have with foreign people."

"If left to themselves could the Filipinos take care of themselves?" I asked him.

"That is rather a difficult question to answer," was the reply. "If the United States should leave us entirely to ourselves, we should have to redouble our efforts. We should anticipate no trouble. In case of invasion we would have to call upon the United States."

If you suggest foreign invasion to a Filipino who will talk calmly on the independence question, and is disposed to listen to reason at all, you find that the sort of independence he wants is the kind that would allow him to run everything in the Islands to suit himself, and then, if he treads on the toes of some foreign power, to yell for help to Uncle Sam to come along with his army and navy and deliver him, and then go back home again. And you cannot persuade him that that would be anything but right and proper. "Why else did the Americanos take us away from Spain?" he may ask you.

New York City.

Recent Developments of Bergson's Philosophy

By Edwin E. Slosson, Ph.D.

[The following may be regarded as supplementary to the sketch of Professor Bergson by the same author published in our issue of June 8, 1911. Among the most important of the contributions to the subject that have appeared since are the two new books here discussed, one defending and the other criticising the Bergsonian philosophy.—EDITOR.]

Among the numerous followers of Bergson, none is more enthusiastic or sympathetic than Eduard LeRoy, a modernist Catholic—if that since the encyclical is not a contradiction in terms—who has for many years been in close touch with Bergson, and has been especially interested in the religious and ethical applications of his theories. His introduction to Bergson's philosophy,* now translated, is therefore useful, not merely because it gives in brief a competent exposition of Bergson's ideas, for the beginner would probably find it quite as profitable and enjoyable to read the same number of pages of *Creative Evolution,* but chiefly because Mr. LeRoy is in a way an authorized spokesman, and so we can get some notion of Bergson's opinions about questions on which he has not yet exprest himself. For example, Bergson in all his books never deals with religion, altho it is obvious that his philosophy has the closest relation with religion in many of its aspects. LeRoy, however, is not so reticent, and he closes the volume with the following noteworthy passage:

> In the depths of ourselves we find liberty; in the depths of universal being we find a demand for creation. Since evolution is creative, each of its moments works for the production of an indeducible and transcendent future. This future must not be regarded as a simple development of the present, a simple expression of germs already given. Consequently we have no authority for saying that there is forever only one order of life, only one plane of action, only one rhythm of duration, only one perspective of existence. And if disconnections and abrupt leaps are visible in the economy of the past—from matter to life, from the animal to man—we have no authority again for claiming that we cannot observe today something analogous in the very essence of human life, that the point of view of the flesh, and the point of view of the spirit, the point of view of reason, and the point of view of charity are a homogeneous extension of it. And apart from that, taking life in its first tendency, and in the general direction of its current, it is ascent, growth, upward effort, and a work of spiritualizing and emancipating creation: by that we might define Good, for Good is a path rather than a thing.
>
> But life may fail, halt, or travel downward. . . . Each species, each individual, each function tends to take itself as its end; mechanism, habit, body and letter, which are, strictly speaking, pure instruments, actually become principles of death. Thus it comes about that life is exhausted in efforts toward self-preservation, allows itself to be converted by matter into captive eddies, sometimes even abandons itself to the inertia of the weight which it ought to raise, and surrenders to the downward current which constitutes the essence of materiality: it is thus that Evil would be defined, as the direction of travel opposed to Good. Now, with man, thought, reflection and clear consciousness appear. At the same time also properly moral qualifications appear; good becomes duty, evil becomes sin. At this precise moment, a new problem begins, demanding the soundings of a new intuition, yet connected at clear and visible points with previous problems.
>
> This is the philosophy which some are pleased to say is closed by nature to all problems of a certain order, problems of reason or problems of morality. There is no doctrine, on the contrary, which is more open, and none which, in actual fact, lends itself better to further extension.

I have quoted this entire because Professor Bergson has given it his endorsement in the plainist terms. In a letter to Mr. LeRoy about the book he says:

> Your study could not be more conscientious or true to the original. Nowhere is this sympathy more in evidence than where you point the possibilities of further developments of the doctrine. In this direction I should myself say exactly what you have said.

The passage quoted above from M. LeRoy's book has, then, almost the signi-

**The New Philosophy of Henri Bergson.* By Edouard Le Roy. Translated by Vincent Benson. New York: Henry Holt & Co. $1.25.

ficance of a signed statement. It was observed that in his lectures in New York last winter Professor Bergson was much more outspoken than formerly in his views upon religious matters; as, for example, when he replied affirmatively to the question whether he believed in immortality or not. It may be anticipated that his future work will be in the development of his philosophy along the lines indicated by M. LeRoy, altho we may expect—judging from his former books—that this will take the form, not of the formulation of a new moral code but of the discovery of a new way of looking at life and appraising action.

Until recently the triumphal march of Bergson into increasing popularity and influence has met with little systematic opposition. Some have found him obscure. Some have called him absurd. He has his devoted partisans and bitter opponents. But his views have not yet been subjected to the thoro criticism which they must inevitably receive sooner or later. A step in this direction is the study of the pragmatic movement by René Berthelot. The first volume of his *Utilitarian Romanticism* deals with the pragmatism of Nietzsche and Poincaré; the second with the pragmatism of Bergson.* The author, after the manner of historians of philosophy, is more concerned to determine what is new in Bergson than what is true. He acts upon the old military rule "divide and conquer" and accordingly splits up Bergsonism into German romanticism and Anglo-Saxon utilitarianism, and then proceeds to dispatch these severally after the orthodox manner. This procedure is in a way begging the question, for it implicitly denies the Bergsonian thesis that there may be something new in the world. Tracing a thing back to its roots is all very well, provided that you do not assume that the roots are all there is of the plant that has grown out of them.

In tracing this genealogy of thought M. Berthelot finds Bergson related to Nietzsche on the romantic side. Both, he says, derive their romanticism from Schelling; Bergson, thru his revered teacher, Ravaisson, and Nietzsche thru Hoelderlin, Emerson, Schopenhauer and Wagner. "Like the symbolists, Nietzsche and Bergson have drunk in different cups the water from the same magic fountain; an invisible Vivian has bound them both in the same enchantment."

From the other side of the house—might we say the masculine side?—Bergson derived his utilitarian empiricism; M. Berthelot traces its descent from Berkeley thru Hume, Mill, Bain and Spencer. In the course of this discussion the author introduces the following inglorious formula:

Hobbes: Berkeley :: Nietzsche: Bergson.

Those who are sufficiently expert with the application of the rule of three to metaphysics may work this out at their leisure.

One would suppose, on Mendelian principles, that a hybrid of such diverse and distinguished intellectual ancestry would show more originality than Berthelot is willing to allow to Bergson. At the end of his analysis he comes to the conclusion that Bergson has really made only one important contribution to philosophy, that is, his conception of duration as distinguished from time. As Berkeley in analyzing the idea of space showed how psychological space, that is, the notion of space derived from sensation, differed from mathematical or formal space, so Bergson has shown how concrete duration, or psychological time, differs from mathematical or formal time. But even this theory according to our author is misapplied by Bergson, for it is not an opposition between space and time, but between two different conceptions of both space and time. This is characteristic of Berthelot's criticism, which is mainly directed toward breaking down all along the line the dichotomy to which Bergson is addicted. Bergson's literary skill and amazing popularity seem to annoy him as they do other professors of philosophy in various lands. Whenever he presents him with a bundle of compliments we may detect a nettle hidden in the bouquet, as when he alludes to Bergson as "the Debussy of contemporary philosophy" and he says that with an increasing floridity of style the number of the "bergsoniennes" has come

**Un Romanticisme utilitaire.* Tome II. *Le Pragmatisme chez Bergson.* Par René Berthelot. Membre de l'Académie de Belgique. Paris: Alcan. 7 fr. 50.

to surpass that of the "bergsoniens." But that a philosophy should become fashionable seems to me rather creditable to the public than discreditable to the originator.

Professor Bergson has on several occasions exprest an interest in the efforts of the Society of Psychical Research to throw light into dark corners, and now he has shown his sympathy by accepting the presidency of the English society, a successor in that position to F. W. H. Myers, Sir Oliver Lodge, Sir William Crookes, A. J. Balfour and Andrew Lang. In his presidential address delivered in Aeolian Hall, London, May 28, Professor Bergson made the novel suggestion that if the same amount of effort had been given toward the study of mental phenomena as has been given to physical we might now know as much about mind as we do about matter. The concluding passage of the address is worth quoting:

> What would have happened if all our science, for three centuries past, had been directed toward the knowledge of the mind, instead of toward that of matter—if, for instance, Kepler and Galileo and Newton had been psychologists? Psychology would have attained developments of which one could no more form an idea than people had been able, before Kepler and Galileo and Newton, to form an idea of our astronomy and of our physics. Probably, instead of their being disdained *a priori*, all the strange facts with which psychical research was concerned would have been sought out minutely. Probably we should have had a vitalist biology quite different from ours, perhaps also a different medicine, or therapeutics by way of suggestion would have been pushed to a point of which we can form no idea. But when the human mind, having pushed thus far the science of mind, had turned toward inert matter, it would have been confused as to its direction, not knowing how to set to work, not knowing how to apply to this matter the processes with which it had been successful up till then. The world of physical, and not that of psychical, phenomena would then have been the world of mystery. It was, however, neither possible nor desirable that things should have happened thus. It was not possible, because at the dawn of modern times mathematical science already existed, and it was necessary, consequently, that the mind should pursue its researches in a direction to which that science was applicable. Nor was it desirable, even for the science of mind, for there would always have been wanting to that science something infinitely precious—the precision, the anxiety for proof, the habit of distinguishing that which is certain and that which is simply possible or probable. The sciences concerned with matter can alone give to the mind that precision, that rigor, those scruples. Let us now approach the science of mind with these excellent habits, renouncing the bad metaphysic which embarrasses our research, and the science of the mind will attain results surpassing all our hopes.

But whatever might have been the result if Kepler, Galileo and Newton had turned their attention to psychology instead of physics it must be confest that the Society for Psychical Research has been a disappointment, notwithstanding that it has numbered among its zealous investigators such distinguished scientists as Lodge, Crookes and Wallace. When the society was organized in 1882 its first president, Professor Sidgwick, called attention to the numerous reports of physical phenomena in the seance room and exprest the hope that such evidence would be forthcoming more abundantly now that competent investigators were prepared to deal with them. But quite the contrary happened. As Mr. Podmore puts it in his book on *The Naturalization of the Supernatural,*

> In short, just when an organized and systematic investigation on a scale not inadequate to the importance of the subject was for the first time about to be made, the phenomena to be investigated diminished rapidly in frequency and importance, and the opportunities for investigation were further curtailed by the indifference or reluctance of the mediums to submit their claims to investigation.

It would seem, then, that since mankind, or some small portion of it, has acquired the precision, rigor and scruples of physical science, it has become difficult, even impossible, to cultivate the occult. Still most of us would agree with M. Bergson that, assuming that there was such an alternative opened to humanity as he supposes, science has chosen the better part in undertaking the conquest of the physical world first.

New York City.

The Best Thing in Ourtown

A teacher is always proud of his school if the pupils are prompt to raise their hands whenever he asks a question. Well, that is the sort of school we have. Whenever we put a question editorially we get a lot of answers by return mail and then the difficulty is to decide who shall be called upon for a public recitation. We sometimes think that the snappiest fingers are over in the southwest corner of the room, but then there is another center of activity on the north row, where they are always speaking up even when they are not called on. It is often hard to keep the boys and girls on the Los Angeles and Madison seats from taking up the whole of the recitation hour, which makes trouble with the others. However we hold them down as much as we can without entirely discouraging them. They really are unusually bright kids, you know, and we always call on them when the inspector comes around.

But we were saying before we got to talking this way, we get more responses to our editorial inquiries than we can find room for—but never more than we want, because many of them are alike and we must pick out a variety. The last time we put a question to our readers was on May 15, when we asked:

WHAT IS THE BEST THING IN YOUR TOWN?

Every town, big or little, has or at least thinks it has some advantage over all other towns and these are what we should like to hear about. Just as housewives exchange recipes thru the medium of the family paper so new wrinkles in municipal housekeeping might well be shared by the public. It may be a new-fangled charter or a hitching-post, a public market or a park, a festival or a sewer system, but there must be something that the visitor to your village or city would notice and admire.

We can give only a few of the replies here. Others will appear from time to time in our "Survey of the World" department. First comes a man from Kansas:

CURRENT TOPIC CLUBS.

The "Best Thing in Ourtown" is the Current Topic Club, which was organized in Fort Scott, Kansas, ten years ago by the general secretary of the Y. M. C. A., getting together not over a dozen preachers, teachers and doctors, meeting at 6 o'clock every Monday evening during the winter, sitting down to a frugal supper, for which each man paid twenty-five cents, after which some one spoke on some current topic of general interest, religion and politics only being barred.

No membership fee or qualifications were required, the only requisite being to notify the secretary on each Monday morning that the member would be on hand that night, and thus "get his name in the pot." The officers are a president, vice-president and program and "gravy" committees.

A few more attended each succeeding year, until five years ago when the association moved into its new building, the membership had increased to about thirty. In 1911 the membership averaged forty or fifty. During the winter just past the average atendance has been one hundred, composed of the leading business and professional men of the city, Gentiles and Jews, Christians and non-Christians, and including many of the young men who will soon be at the head of affairs. It is an inspiring sight to see this "bunch." When a man comes once, it is impossible to keep him away.

The topics range from automobiles and the Balkan question to sex hygiene and taxes; the speakers, from college professors to the local fire chief. They are not confined to local men; the program committee is ever on the alert and secures any good speaker who may be in town. "Plain living and high thinking" and good fellowship prevail and the educational value of the club is inestimable. GEORGE O. BACON.

Fort Scott, Kansas.

Next to Kansas comes Missouri, and apparently not behind it in the fine art of good mining. Such a club room for country women is much needed in many towns, east and west, and not at all impracticable for any of them.

A COUNTRY WOMAN'S REST ROOM.

The starting point was the simultaneous purchase of a farm and an automobile by a gentleman of some leisure and boundless energy, residing in Carthage, Missouri. The trip to the farm took him over some very bad roads and the result was the organization of a Good Roads Club. From his work in improving the roads followed a large acquaintance with farmers and many conversations on the subject of "going to town."

Said this man to a member of a large woman's club in Carthage: "It is a shame that there is no place in this town, the county seat, where the country women can rest and wait during the long market day in town."

Said the Club Woman: "Why not have one?"

Said the Good Roads Man: "Get one

and we'll all help you. It's as important to the upbuilding of this town as the good roads themselves."

Whereupon the lady made a talk to the Cosmos Club, setting forth the need for such a room in the county seat for the use of woman visitors. It was not to be solely for the countrywomen, altho it would probably be of more service to them than to any one else.

The idea was that this should be in no sense charity, but a business proposition. Carthage, like every other wide-awake town, had wakened to the fact that her prosperity depended not so much on the acquisition of new factories as on the farmers who made her their market, on the acreage and productivity of the agricultural land she tapped. There were four other towns who were just as keen about drawing the farmers to them as Carthage. Why not, she said, make some inducements to the farmers? It was the old question of competition. All this being true, the ladies felt that the merchants would jump at the chance to support such a room. A few of the merchants were approached. They were enthusiastic.

It was desirable, however, that this room should be located some place where the countrywomen should feel at home, should feel they had a right to be. The most logical place, therefore, was in the county court house. The court house was inspected and an available room on the ground floor discovered that had always been used for storage.

A meeting of all the women of Carthage interested in such a thing as a rest room for visiting women was called. A large number responded and an enthusiastic Rest Room Association was organized which, later, was incorporated. There are many retired farmers living in Carthage. Their wives all appreciated the need for such a room and gave valuable aid in planning for it. The work was divided, funds were solicited, plans drawn, estimates prepared and at last the association was able to send a delegation to the county court with a proposition that, if the county court would provide the room, as well as janitor service, heat and light, the Rest Room Association would provide furniture and pay for the services of a matron to be in constant attendance there. The Rest Room Association assumed all responsibility for the order maintained, for the good care of the room and the success of the undertaking and had sole authority over the matron.

After considerable deliberation during which the pulse of the country people was felt, the county court agreed. The room was cleaned, refinished and plumbing put in. It was then attractively furnished. The wife of the janitor of the Court House was engaged for matron. She proved to be an ideal woman for such a place. She was a good mixer, a careful manager, tactful and thoroly interested. She kept a list of all the visitors to the room. She soon had a list of girls who wanted to come to town to work. She knew of the good boarding houses for the young country boys and girls who wanted to come to town to school. She became a sort of county information bureau.

The rest room idea has proven a wonderful success. Last year eighteen thousand visits were made there—this in a town whose entire population numbers only nine thousand. The country women say that it has done more than give them a place to wait, to refresh themselves and rest in. It has meant more to them than a meeting place where they may run across friends from the other part of the county. It has made them feel that they really belong, that Carthage is *their* county seat.

As soon as the money was raised and the association financially on its feet the membership was thrown open to the country women so that they might have a word about the management. This year, when the election of officers was held, the wife of the largest landholder in Jasper County was made president. From each township in the county was elected a vice-president. Thus it is, in every sense, the country women's own room.

EMILY NEWELL BLAIR.

Carthage, Mo.

Ourtown in the following letter is so modest that it does not want its name mentioned. It is willing to let its light shine only on condition that it shine anonymously. We shall not therefore be betraying any secret when we say it is not a Western town.

A SCHOOL ALLIANCE.

Three years ago last fall, a little group of women of Ourtown met by invitation at the home of one of us to consider what we might do, as a body, in the interests of our public schools and of the children of the town. We organized ourselves into a Woman's School Alliance, from which title, in the course of a year or two, the word "Woman's" was dropped in response to an active interest and desire to coöperate on the part of some of the men. We are not even yet a large body; our membership stands at about seventy-five; but we are, I believe, an active influence for good and a force to be reckoned with in town affairs.

Ourtown is a New England village of about five thousand, and all our children attend the public schools—there are no others! Hence each family, whatever its social standing, has a vital stake in their healthfulness and efficiency. We found that, as in other places, many intelligent parents had never visited their children's classrooms and did not know their teachers by sight! We inaugurated a system of school visiting by a committee of experienced observers, mainly former teachers, whose individual written reports are submitted to the whole committee for discussion and confirmation, after which such action is

taken as seems advisable to our council. In several instances recommendations have been made to the superintendent of schools and the school board. This work was carried further last year by an organized "School Survey" in which we were assisted by experts, and the final summing-up published in the local newspaper. Interesting and instructive comparisons were made between our own schools and those of similarly situated towns in our own state. General visiting by parents is also encouraged and has been increased by our efforts and example. A hospitality committee shows attentions to teachers, especially welcoming new teachers.

We have informed ourselves upon the school laws of our state, have been in close touch with our state superintendent of instruction and with other experts in the field, and have to some extent made observations in neighboring states as well.

One of our first enterprises was the bringing to Ourtown of a school and district nurse, whose services proved of real value, especially in epidemics, and have been generally recognized by our citizens. This branch of the work was financed by special gifts and subscriptions, our small annual dues being sufficient to meet only running expenses. We were instrumental in having founded a flourishing Boys' Club, which has grown and subdivided, the older boys and young men now having their own organization and clubrooms. A clothing committee for some time collected, repaired and distributed used garments among needy families, but this work has since been relegated to other organizations. A committee on school buildings and playgrounds, with an architect at its head, has made valuable suggestions, some of which are being adopted. Our representatives have frequently visited the motion picture show in town and have conferred with its manager in regard to films deemed undesirable as well as conditions of lighting and ventilation. This has led to the formation of a committee on public entertainment which will continue these and further activities in the interests of wholesome recreation for our young people.

Each year several public meetings are held, with capable speakers on such topics as "Manual Training in Schools," "High School Curricula," "School Heating and Ventilation," and the like, which talks are well reported for the press. Our monthly meetings for business are conducted by our executive body, called the Council, and most of our active work is done by committees. Our officers have repeatedly met with the school board, and are frequently consulted by parents and citizens on matters connected with the schools. We have in this way helped to handle more than one delicate and important situation. Tho by no means all suffragets, we interest ourselves in the annual town meeting as never before, especially, of course, in the election of members of the school board and in appropriations for schools.

A TOWN CLUB FOR COUNTRY WOMEN

Country clubs for city men are nowadays common enough, but the Carthaginian women have started something more useful in providing a room where the farmers' wives may rest and meet their friends whenever they come to town.

We had hoped to be able to leave out Los Angeles county this time, but no; we must hear how the Sierra Madre Woman's Club ran a moving picture show.

THE MOVIES.

In these days the existence of a woman's club in a place of some eighteen hundred residents is not at all remarkable, but one of the undertakings of the Sierra Madre Woman's Club is worthy of distinct men-

tion. As is so often the case in a small town, social events at the churches, an occasional dance, with now and then some more or less expensive form of public entertainment, had exhausted the opportunities for evening amusement. The absence of a motion picture theater was badly felt. Commercial adventurers who were induced to look over the situation found the possible profits too limited—your town is too near a large city, they said.

Then it was that the Woman's Club asserted a willingness to assume an additional responsibility for the social welfare of the community. And so it came about that since September this town has been privileged in having two exhibitions of motion pictures every week. The club house served the purpose admirably. The doorways were numerous enough to furnish adequate exits. At some cost the fire hazard was reduced in compliance with the underwriters' requirements. The janitor assumed the duties of operator. The village trustees generously left the question of censorship in the hands of the club, safe in the knowledge that this privilege was in no danger of abuse. In short, the conditions under which the venture is conducted could hardly be bettered.

The members of the club and occasionally the school children add variety to the program by volunteering some form of music. At each performance the auditorium is comfortably filled and the revenue from the five and ten cent admission charges has been sufficient to pay the cost of operation, the charge for film rentals and the monthly installments due on the purchase price of the apparatus. Altho, strictly speaking, no financial profit can be shown, except for the small amount of time gladly given by the committee in charge, the cost to the club has been nothing but the gain to the community has been immeasurable.

MAX W. WOLFF.

Sierra Madre, Cal.

The women are always doing something; in one town starting movies, in another stopping them. But as a general rule it is better to start things than stop them. When you are pulling on anything you can guide it; when you are merely trying to stop it you are apt to get run over.

So many letters tell of the achievements of the women's clubs that we are reminded of the minister's conference in a certain town, where the topic for consideration was printed on the program as "Why Women Are More Active in Church Work Than Men; and How to Prevent It." That, of course, was not what they meant, or at least, was not what they meant to say. But perhaps the clergyman who got up the program was so much of a classicist that he had in mind the primary meaning of "prevent" as derived from *praevenire,* to come before, to get ahead of. This is in fact the only legitimate sense in which the word can be used in this connection.

But it is coming to be much the same in civics as in church, and if the men want to prevent the women from monopolizing municipal enterprise they will have to get a move on—beg your pardon, we should say, acquire an acceleration. In Rhode Island, it appears the men's club is doing something:

TREE PLANTING.

A helpful and inspiring campaign of tree planting has been recently carried on in Providence, Rhode Island, which I believe is worthy a place in the list of "worth while" achievements for which you ask.

This movement is helpful in that it has resulted in planting five thousand maples on the streets of the city, mainly in the poorer and less favored sections. Trees which will bring welcome shade in parts of the city where it is most needed, screening the unsightly from view and cultivating some appreciation of the beauties of nature in neighborhoods where such an opportunity has long been lacking.

This movement is inspiring in that it has been brought about by the contributions and efforts of a large number of public-spirited citizens willing to contribute voluntarily of their means for the public good.

Local tree planting at one of the public schools, undertaken by a men's club, was given prominence in one of the daily papers. This inspired an interested citizen to start a fund for further tree planting which was taken up and pushed by the same paper. The response was so generous that the goal was set at five thousand trees, and the efforts were continued until the desired amount was pledged, the contributions being three dollars per tree including loam, planting and tree guards. This campaign has also stimulated interest in private tree planting and in the care and preservation of trees already growing.

Providence, R. I.

If you find these experiences interesting, see if you cannot interest others in what you are doing for your own town.

Chroniclers of the Balkan War

How the Modern War Correspondent Gets His News—or Fails To

By George Marvin

[One of the amusing features of the war was the charge of the army of war correspondents to the seat of war and their subsequent retirement, singly or in squads, after their repulse by the Balkan allies. But whether they saw any fighting or not they had to deliver the due tale of copy. Consequently we have had thrilling accounts of battles that never occurred while really decisive battles were never mentioned. Now that the smoke of conflict has cleared away, the question arises, How much do we actually know of the war against Turkey? In how far can the historian of the future rely upon these contemporary accounts? As a first step in this direction we have asked Mr. Marvin, who represented American journals in the war, to review the books which have been published by other correspondents.—EDITOR.]

After the armistice had been signed at Tchatalja on December 3 there was a grand exodus of war correspondents from Constantinople. A week later one Englishman, the representative of a London weekly, and myself, were the only special emissaries left in Turkey to chronicle the entr'acte and wait to have their judgment confirmed by the reopening of hostilities. This precipitate withdrawal in force seems to have been partially actuated by a general and competiitve desire to produce books and lectures on the war. Nearly every one of the authorities took it for granted in December that the war was finished and therefore a subject for final comment and deduction. And in a time when public interest veers so quickly, these gentlemen are not to be blamed for hastening into print and lantern slides while still a general attention was theirs.

Thus, within less than three months from the signing of the armistice, five books on the "recent war" had been published in England, two in Paris, three in Germany and one in Austria.* As a matter of industrious authorship and high-pressure bookmaking the performance is remarkable. But when these books began to appear in print, "the recent war" was going merrily on again, and events which have taken place since the hegira of the war correspondents make their chronicles merely those of campaigns, the first campaigns of a struggle which is at this present writing still unconcluded.

"This is all wrong," observed Mr. Ellis Ashmead-Bartlett, wearily getting back to the Pera Palace Hotel on a rainy night in January. "These bally idiots don't seem to realize that their war is finished." He spoke with annoyance, for he had been obliged to abandon a remunerative lecture course and the Capuan delights of a London season to return to the raw Black Sea wind and the mud of Thrace. To make matters worse, the first edition of his very readable book and printed reports of his early lectures arrived in Constantinople about the same time that he did, so that when he presented himself at the Porte for his credentials, he was confronted with marked copies of his own works, wherein he enlarged upon the utter incapacity and stupidity of the Turkish army and consigned a rotting Ottoman Empire to Asia Minor and ultimate oblivion.

"Credentials?" they said to him. "Certainly not. Deportation is what you deserve."

The very enterprise which the prompt appearance of these books records operated as a handicap to their authors in their subsequent activities in Turkey, and it has also prevented any one of the brief histories thus far published from having more than temporary value. A book on the Turko-Balkan War of 1912-13 has yet to be written. Since these manuscripts went to press in December and January, many important events have occurred which must be included in any thoro consideration of the war as a whole: the *coup d'etat* of Enver Bey on January 23 brought the Young Turk war party back into power and repudiated the admission of defeat the day

**With the Victorious Bulgarians.* By Lieutenant Hermenegild Wagner. Boston: Houghton Mifflin Co. $3.

**With the Turks in Thrace.* By Ellis Ashmead-Bartlett. London: Heinemann.

**With the Bulgarian Staff.* By Noel Buxton, M. P. New York: The Macmillan Co.

**The Balkan War Drama.* By Cyril Campbell. New York. McBride, Nast & Co. $1.40.

before by Kiamil Pasha's ministry; Janina has fallen to the Greeks; the Bulgars with Servian help have taken Adrianople, thus possessing themselves of the all important rock on which the London negotiations foundered; the battle of Bulair has been fought; and Nicholas of Montenegro has at last, after a siege of six months, marched in triumph into Scutari, thus imperiling the peace of Europe. Albania's boundaries are full of potential trouble. So is the question of who shall eventually possess Salonika. The allies seem to have begun quarreling among themselves. Every one is weary of war, but real peace is a long way off yet.

WOUNDED TURKS CARTED FROM TCHORLU AND LULE-BOURGAS

In addition to their lack of finality, there are also scattered thru most of the books written on this war many errors and defects which may charitably be charged up to haste. For example, the maps which are liberally supplied with Lieutenant Wagner's book are of slight value to the general reader because many of the important places mentioned in the text are not plotted upon them, and other references are spelled differently from the chart reading. In Mr. Cyril Campbell's narrative occur several misstatements of fact which might easily have been avoided by a careful reading of proof. On page 142, for instance, he is entirely in error as to the organization and command of the three Bulgarian army corps, assigning the Third Army to General Kutincheff, putting Ivanoff—who promptly in October with his Second Army invested Adrianople and stayed there—in command of the First Army at Kirk-Kilisse, and missing the whole strategical significance of the Thracian campaign by passing over Radko Demitrieff's brilliant achievements, in command of the Third Army on the Bulgar left flank, all the way from the frontier to Tchatalja.

But allowing for these and other mistakes attributable to haste, and accepting these books as preliminary skirmishes, they are, each and all of them, very entertaining reading. Of the particular five commentators here thru their books under consideration, Lieutenant Wagner and Mr. Cyril Campbell concern themselves primarily with the war. Major James and Mr. Ashmead-Bartlett have really written accounts of their personal adventures and the adventures of their colleagues and competitors during three weeks of the Thracian campaign. Mr Noel Buxton, as a member of the British House of Commons and the Balkan Relief Committee, was allowed, after the decisive actions of the campaign had been fought, to accompany the Bulgarian General Staff, not as a journalist but as a political guest and ob-

server, over the battlefields of Thrace to the Tchatalja front, a unique privilege which he did not abuse by seeking to turn it to literary account during the further progress of the campaign. Of these five books his is by far, I believe, the most informing contribution on the war, but it is not to be regarded as in any way the work of a war correspondent.

Such considerations as these bring up freshly the whole question of the war correspondent: has he a legitimate place in the making of war or has he, as Mr. McCulloch and others of the brotherhood have said, seen his last fight? What constitutes war correspondence? And what has been the effect of the present war in determining its character and value.

The Bulgars have gone several steps further than the Japanese in enforcing restrictions on war correspondents. With the probable exception of Lieutenant Wagner, of the Vienna *Reichspost*, no correspondent on the Bulgar side got to the front during the fighting. As to whether or not Lieutenant Wagner actually did there is some diversity of opinion. The Servian and Greek embargo on news from their respective fronts was less airtight, but as long as the center of interest remained in Thrace, less publicity than they deserved fell to the share of those correspondents in Macedonia and in Thessaly.

As for the Turks, they started with extreme restrictions, which prevailed up to October 28, when, in the general disorder created by the battle of Lule-Bourgas, several adventurers—among them Ashmead-Bartlett, Major James, Angus Hamilton, Donahue and McCulloch—escaped from Tchorlu, where all the fraternity had been herded together under an official called by Major James the "Bosniak Shepherd," and thereafter roamed practically at will thru the remaining operations to the last day's fighting at Tchatalja. Indeed, Mr. Hamilton and Mr. McCulloch succeeded in running into some Bulgar cavalry patrols, thus getting themselves arrested and shipped back to Sofia, greatly to their own satisfaction and subsequent prestige.

THE MODERN WAR CORRESPONDENT

He is provided with a motor car, but kept away from the front. This is a German correspondent at Buyuk-Chelkmedje.

It was due to this temporarily unrestricted activity of such roving free lances that the retreat from Lule-Bourgas became exaggerated out of all proportion to the main engagements of an otherwise censored war. The Turk has lost in this war not because he is inferior as a fighting man to the Slav or the Greek, but because he has been unable to profit by his own or other nations' experience. In the matter of

war correspondents he did, however, profit by—or at least make deductions from—his November experience. He was still profiting by it when, in the early spring, I left Constantinople for Athens, leaving also at the hotels of Pera about forty correspondents of various nationalities who had been consistently unable, since the renewal of hostilities on the 3d of February, to make any impression on Mahmoud Shevket, the new Grand Vizier, and his war administration at the Porte.

PRIVILEGED FOR THE LAST TIME

This Russian correspondent, with his field kit, is outside the Tchatalja lines. The new Ottoman government absolutely refused to allow any correspondents at the front; and in a majority of cases refused even ordinary passport permits.

A letter, dated Constantinople, April 22, from Mr. H. M. Paget, special correspondent of the London *Sphere*, states that on the 25th of March a party of war correspondents, including the reinstated Bartlett and himself, was allowed to go to the front again at Tchatalja, in charge of Zekki Bey, the official censor. "We stayed on at Hademkeuy" (Turkish General Staff Headquarters) he writes, "taking our meals with the officers and getting a certain amount of fun out of the camp life, but that first fight which we had so unfortunately missed proved the last fight of the war."

In brief, then, so far as chronicles which have thus far appeared in English are concerned, there is no first hand account on either side of the decisive Thracian campaign up to October 28, unless it be that of Lieutenant Wagner. From Lule-Bourgas (October 28-November 2) to the armistice, December 4, several eyewitness accounts have appeared, such as those of Major James and Mr. Bartlett, for example, all of them, however, on the Turk side. There remain the *ex post facto* accounts of those who, like Mr. Noel Buxton, make no pretense of having been present at the front, and authoritative reviews of the campaign such as that published in the columns of the London *Times* in its issues from February 12 to March 21. These latter papers constitute, I believe, the most informing and accurate account in English of the Turko-Bulgarian campaign from Mustapha Pasha to Tchatalja (October 17-November 21) which has yet appeared in print. They are the work of a British officer of staff rank who during the armistice was given every facility by both Governments, but particularly by the Bulgar military authorities, to visit the field of operations and thus obtain his materials with a perspective cleared of battle smoke and an utterance unclogged by censorship.

Putting all this material together, it is possible to get a comprehensive idea of one of the shortest and what may prove in its ultimate results to have been one of the most decisive campaigns in

history. The vivid pictures of Noel Buxton, James and Bartlett recreate the reality of scenes and events which are recorded comparatively without personal flavor or picturesque detail in the narratives of Wagner, Campbell and the military expert of the *Times*. Taking the consensus of opinion, it is possible to correct some generally accepted misinformation, and it is also interesting to note the points of variance among different historians.

A very important fact to be grasped on all the evidence is the decisive nature of the very first general engagement of the campaign, which took place west of Kirk-Kilisse on October 22-23. The direct effect of that first impact seems to have carried headway clear thru the battle of Lule-Bourgas, five days later, and to have determined not only the stampeded evacuation of Kirk-Kilisse itself, but to have materially prejudiced the result of the later battle. Noel Buxton rode with Savoff, Ficheff and the Bulgar General Staff over the actual ground where, from Tartarlar thru Selioulu to Yenidje, the first division of the Bulgar First Army began that series of terrific attacks which broke the Turkish First and Fourth Army Corps, whose retreat was so mercilessly followed up by the Bulgarian cavalry division—the only effective use of cavalry for other than scouting purposes, by the way, in the whole Thracian campaign—that it became a panicstricken rout of far-reaching consequences. Mr. Buxton says of this engagement:

"It was the decisive battle of the war, but it was never reported by the Government. In London its very name is unknown."

The military correspondent of the *Times* corroborates Mr. Buxton in attributing the Bulgarian occupation of Kirk-Kilisse, "practically unopposed," to the wild consternation caused by the arrival there of refugees from the Selioulu fight, and ascribes also to that superb assault "the utter demoralization of three or four whole Turkish corps."

Six days later the further consequences of this rout were further recorded on the Turkish side by Ashmead-Bartlett and Major James, both of them eye witnesses of the fighting around Lule-Bourgas. Major James says:

"It is important that the reader should realize that this broken soldiery, . . . the fugitives of the First Army Corps, had not been engaged in the battle of Lule-Bourgas. They had been routed six days before at Yenidje and had fled thence without reforming thru Baba Eski to Lule-Bourgas. . . . It was these disreputable soldiers that the foreign correspondents fell in with while the battle of Lule-Bourgas was being decided. It was their broken ranks and terror-stricken flight that furnished the lurid lights in the graphic description of the Turkish rout which galvanized Europe and incidentally deceived the Bulgarians."

"What of the First Army Corps, Excellency?" said Lionel James to Ahmed Abouk Pasha at Tchorlu, during the retirement of the Ottoman army to Tchatalja. Ahmed had been in command of the Turkish left wing thru which had streamed the rout from Yenidje and Baba Eski, breaking up his dispositions and demoralizing his own Nizam troops.

"Don't speak to me of the First Army Corps," he replied. "It is their half-trained intellectuals that lost me the battle of Lule-Bourgas."

There is, indeed, no doubt now that the retreat from Lule-Bourgas to Tchatalja was a deliberate retirement on the part of the main Turkish army. In the first place no Bulgar pursuit prest them. Five days of steady rainfall made that retirement thru the mud forlorn beyond description, but it was never panic-stricken. The same almost impassable condition of the roads which forced the abandonment of Turkish impedimenta held up an utterly exhausted Bulgar army in the positions they had carried at frightful cost in the last big battle of the campaign. An interval of seven days before the unimportant long range actions began at Tchorlu and Tcherkeskeui may have saved the Turkish army, but, as witnesses on the Bulgar side now admit, it was an interval more necessary to the victors than to the vanquished.

At this point in the story one of the serious differences occurs between the accounts of the British correspondents on the Turkish side and Lieutenant Wagner on the other. The latter describes a battle of Tchorlu as "still more terrible" than Lule-Bourgas! "For days

after," he writes, "the river was dammed with corpses and war material in several places, and tinged red with the blood of the dead and wounded." And again, "There were also terrible scenes at the taking of Strandza (Istrandja) and during the unsuccessful stroke of the Turks from Kapakli Bunar to the northwest-

FERDINAND OF BULGARIA AND HIS STAFF IN FRONT OF KADIKOI
From Lieutenant Wagner's *With the Victorious Bulgarians* (Houghton).

ward. . . . The Turks broke into a wild flight, . . . but before they could reach Kapakli Bunar they were decimated by the Bulgarian artillery and infantry fire."

Unfortunately this must be indexed as fiction. Abundant evidence exists to prove *there never was a battle at Istranja*, and as for Tchorlu, Noel Buxton, who rode into the town with the Bulgar advance column on November 12th, says: "The rear guard action which handed over Tchorlu to the invaders lasted only two or three hours." The chief features of the place which he noted were an exploded water tank and some dead horses at the station, and the disgustingly unsanitary condition in which the Turks had left the town. And Lionel James, who did not leave Tchorlu until the 10th of November, says that on that day, before a shot had been fired, Hakki Pasha's main rear guard division had abandoned the town and disappeared. "Its place had been taken," he continues, "by the independent cavalry which at this time was reduced by the wastage of war to about the strength of a single regiment."

Another serious discrepancy exists in the accounts of the siege of Adrianople. Here it would appear the Austrian corre-

spondent, describing in detail repeated sorties by the garrison and many sanguinary attacks by the besigers, is again in error. The military correspondent of the *Times* conclusively proves that, prior to the armistice, there were only two sorties by the garrison, those of October 22 and October 29—the latter to create a diversion during the battle of Lule-Bourgas — and only one Bulgarian assault—that of November 20—was made on the fortress.

Such instances as these must materially weaken one's faith in war correspondence, for, if the truth must be told, this imaginative style was not by any means confined to the Vienna *Reichspost.* A four months' association with this war in Turkey has convinced the writer that an impatient demand for sensational news on the part of newspapers and weekly journals, together with the almost insuperable obstacles in the way of getting first hand at sound information proved too strong a combination for many a conscience. But such slipshod reporting, excusable as it may have appeared at the time, has already done much to discredit the profession, or what was once the profession, of war correspondent. Other people's wars are no longer the subjects of absorbing interest they once were; at least in America there is too much domestic competition, as a rule, and a jaded attention can perhaps best be stimulated by photographers, cinematograph operators and impressionists of the pen.

To make the contrast of changing times more vivid it is very interesting to turn back and read accounts of the Russo-Turkish campaigns of 1877-78, over the same territory as that covered in the present war, by those famous war correspondents—three of them Americans—of the last generation, MacGahan, Archibald Forbes, F. D. Millet, Sir Henry Havelock, E. M. Grant and Villiers. In their books, and in the files of the London *Times,* the *Daily Mail* and the illustrated weeklies, the character of war correspondence was then strikingly different; less sensational, but not less vivid; entirely impersonal, but much more convincing. Subsequent examinations of campaigns and battles have left such accounts almost unimpaired.

Writing of these men and of other correspondents with the Russian army from Plevna to San Stefano, Gen. Francis V. Greene, U. S. A., then military attaché with Skobeleff's staff, says:

"The class of men who hold these positions is every day growing in responsibility, in their qualifications for their work, in the value which is set upon their services, *and in the consideration and dignity with which they are treated.*"

New York City.

To the New Super-Dreadnought New York

By Victor Starbuck

O Ship, we weigh how many tons of brine thou dost displace,
  Where Ocean lifts thee in thy gala-dress:
Who weigheth what thou dost displace where red hearts beat
  Of song, of happiness?

O Ship, we know a thousand cranes of molten steel were spilled
  To cast thy plates, where Vulcan's engines grind:
Who knoweth the man-brawn, that might have tilled earth's fields
  For profit of mankind?

O Ship, we count the millions taxed from labor that were piled
  And poured to buy thee in a golden flood:
Who measureth the food of mothers and of babes,
  The sweat, the tears and blood?

Orlando, Fla.

THE NEW BOOKS

The Joy of Words

Do you enjoy words? Not words for words' sake—they have no sake. Words for poetry's sake. If you can't imagine just what this means, you would better obtain a copy of Max Eastman's book, *Enjoyment of Poetry.**

Mr. Eastman was formerly a professor of esthetics. But that Mr. Eastman is no longer a teacher at Columbia University you may judge by the fact of his editing *The Masses:* a monthly magazine of Socialism that prints very few wise words, but is, artistically, the most reassuring publication issued in America. The reviewer who makes this rash assertion is no Socialist. Not that Mr. Eastman is obsessed by his "cause" when he relaxes and writes his plea for "perception and conversation." His book is much the better for having only one direct allusion to economics, and no sociological trend whatsoever.

No statement is more timeworn than that "poetry is one of the dear possessions of a young people." Mr. Eastman, however, shows how poetry is truly natural in that it is truly the heritage of youth. He defines the essence of the poetic temper in these short, understandable words: "A wish to experience life and the world." Isn't this youth? "Children are poetic," the writer continues.

> They love to feel of things. I suppose it is necessary to their preservation that they should be, for by random exercise of their organs of feeling they develop them and make them fit for their practical function. But that is not the chief reason why they are poetic; the chief reason is that they are not practical. They have not yet felt the necessity, or got addicted to the trick, of formulating a purpose and then achieving it. Therefore this naïve impulse of nature, the impulse toward realization, is free in them.

Has it ever occurred to you how *second*-childish is our own grown-up attitude toward children and the poetic temper—as Mr. Eastman defines it? We at once envy childhood its illusions and breathless experiments in life and realization, and feel ourselves children's superiors because, being grown-up, forsooth, we've lost the charm of life! To accept one of Mr. Eastman's illustrations of childhood's advantage over age, see what he has to say about derby hats:

> To us a derby hat is for covering the head, and that is about all it is; but to them [children] it is hard, smooth, hollow, deep, funny, and may be named after the mixing-bowl and employed accordingly. And so it is with all things. The child loves a gem with its pure and serene ray, as the poet loves it, for its own sake.

The poetry that is in words, even unrimed words, is present to Mr. Eastman not in Homer alone but in Jerry Chambers's greeting to an automobile party that stopped for a drink of water at his well: "Ye came over that hill like a greased mouse." "And ain't this a singin' mornin'," is another poem from the same source; "You feel as if you was gettin' born." At the other end of the poetic scale—but grimly humorous poetry for all that—is the observation of a Virginian that comes to mind, spoken of a clumsy, ill-appearing adolescent: "Poor Will! He's *just on the earth.*" Children, according to Mr. Eastman, are often intolerant of poetry in books, because they find it nearer home. Their minds are "skies full of floating imagery" and they can evoke the inmost essence of the homeliest objects, discovering kinships in nature incredible to science and intolerable to narrow-minded common sense. To one child-friend of Max Eastman's a slice of toast is a "zebra"; "nothing with a tail" is a snake; the cat purring is a "bumblecat"; the white eggs in the incubator have "blossomed." But education, writes this esthetician who scorns to use the jargon of his old trade, soon robs children of their quaintness. "They are taught that

**Enjoyment of Poetry.* By Max Eastman. New York: Charles Scribner's Sons. $1.25.*

they must get understanding, they must not linger and look." But if they are not to look, how shall they see; and if they don't see, how are they to understand? School-teaching and home-training alike ought indeed to draw out youth and youthful apperceptions; whereas its aim is too often to dry them up.

If you say that all this pleasant talk of Mr. Eastman's has no practical bearing upon poetry or its enjoyment, no satisfactory answer can be given you—only the advice that you read his book. Surely poetry is the art of sympathy, the gift of grasping analogies not obvious to the prosy mind, the power of conveying this sympathy, this vision, in terms of beauty. "All art is a collaboration," wrote the playwright Synge in one of his prefaces; "and there is little doubt that in the happy ages of literature striking and beautiful phrases were as ready to the story-teller's or the playwright's hand as the rich cloaks and dresses of his time. . . . In a good play every speech should be as fully flavored as a nut or apple, and such speeches cannot be written by any one who works among people who have shut their lips on poetry." In these facts lies, perhaps, the explanation of Ireland's unforeseen gift, in recent years, of a drama rich in fiery imagination and verbal splendor—for in remote Ireland, even today, some part of the adult population can still coin pet names for the stars of night, and confuse the natural and the miraculous, and see the poetry of things of which they do not always know the full utility. Such a people has remained childish, on one side, and practises the art of word-craft. This is no slight matter, if one holds to Mr. Eastman's view, for by that "words make the world grow—not, I think, because they express a feeling, for that means that they relieve you of it, but because they give to the feeling locality and distinct body." Again we read: "Naming things is like cutting doughnuts. Here is an undifferentiated mass of dough, upon which the cutter, which remembers the character of other doughnuts, descends and makes after that character a definite excerpt. Exactly thus a word descends into a general impression and selects out a clear experience." And names are not valuable only in their possible beauty: the right word is magic. "Take off the name," says Mr. Eastman, "and I am not sure but the whole British Empire would vanish like a speculation, and you would have merely a number of people living some here and some there. Annihilate the word 'love,' and you would alter for many the quality of the very fabric of their lives." What some persons see in a mere name is suggested by the controversy now waging between those who would abolish the words "Protestant Episcopal" and christen the church "Catholic." *Il ne faut pas badiner avec les mots.*

To read Max Eastman's book is to vow to use words henceforth with justice and with gusto; forsaking the words that are joyless and pallid, the words that are void and without shape, and the words that are stale. But if Mr. Eastman's readers are to live up to their resolutions they must either use fewer words, or think more truly, or feel more deeply.

The Thirteenth Century*

No century can monopolize human accomplishments, and the thirteenth, of which Mr. Sedgwick writes with evident relish and knowledge, would hardly venture to compete with the fifteenth in the art of painting, or with our own in, shall we say, that of sanitation. But in architecture, in literature, and especially in the greatest art of all that raises men and lets them live on the heights, the thirteenth century, as it worked out its destinies in Italy, can hold its head up with any of its fellows. It marked the very fleeting period during which delicacy and restraint were the characteristics of Italian monuments; it acclaimed Francis of Assisi and found in the language of Dante an expression as pure and as lasting as the Parthenon.

To take up the component parts of so great a period of human activity, to weave them into a worthy whole, high-pitched, yet sane, well-studied and consistent, is one of the most difficult of achievements. It is fair to say that Mr. Sedgwick has not attempted it, nor has

**Italy in the Thirteenth Century.* A short history of politics, religion, literature and art in the times of Innocent III, St. Francis, Niccola Pisaro, Giotto and Dante. By Keney Dwight Sedgwick. 2 volumes. Boston: Houghton Mifflin Co. $5.

he even wished to produce a book for scholars, altho in some branches of his large subject it is clear that he might well set some such ambition for himself. He has chosen rather to write a book for which the dilettante of travel and scholarship will supply the proper constituency.

There are few subjects connected with the thirteenth century which the author does not deal with in a manner suited to this class of reader. The history of great Popes and great Emperors, of Innocent III, of Frederick II, of Manfred, of Charles VIII, of the Venitians and of the Lombard Communes, all appear. We have chapters on the universities, on papal jurisprudence, on Thomas Aquinas. Art, too, and literature figure largely, the early efforts of the southern tongues to achieve permanence, the parallel attempts of painting and sculpture all receiving separate treatment. In fact, Mr. Sedgwick's forty-nine chapters appear like a series of articles, each out of an individual pigeon hole, fitted together into a sort of disorderly encyclopedic survey of the thirteenth century. We note, however, that there were no pigeon holes labeled commerce or war. The illustrations are good and well chosen.

American Immigration

Dr. Peter Roberts's book *The New Immigration* (Macmillan, $1.60) is an excellent example of sentimental economics. To such a writer America is and always should be the haven for the opprest of all lands. Dr. Roberts gives instances of immigrants coming here in search of higher education, of a Polish teacher who fled to escape political persecution in Russia, of Christians fleeing from Mohammedans, of Jews from Christians, and pathetically narrates the story of a Persian who kissed the soil of America on landing. Of course, economic motives play a part, he admits. The Slavs and Italians come here to do our "dirty work"; and as long as native Americans will not do common labor and continue to commit race-suicide foreigners should be welcomed because "every one who has studied these men knows that they have common sense, meekness, patience, submission, docility and gratitude—qualities which have made them admirably suited for the coarse work America needs done." The main contribution of Dr. Roberts's book is an excellent and sympathetic account of the life and problems of our new immigrants, particularly of the Slavs and Italians in the anthracite regions of Pennsylvania.

A keen dialectician well armed with statistics is Dr. Isaac A. Hourwich, whose *Immigration and Labor* (Putnam's, $2.50) is a powerful tract in favor of unrestricted immigration. The main thesis here is that the yearly arrival of vast numbers of foreigners is of great benefit to America in general and to the American workingman in particular. Immigration has been the greatest factor, he declares, in the ever-growing industrial prosperity of the nation; native labor has not been displaced, but pushed upward into the ranks of the skilled artisans. To deprive our industries of their supply of cheap labor thru laws restricting immigration, therefore, would be to drive American capital to Europe and so bring a halt to the march of American industry. So reasons ingenious Dr. Hourwich. These arguments are admirably focused, tho a controversial tone asserts itself thruout. The writer's severe criticism of the report of the United States Immigration Commission, which unanimously recommended restriction of immigration, is plainly inspired by a disagreement with its findings.

Dr. Hourwich maintains that the standard of living among the newer immigrants like the Italians, Slavs and Jews is not lower than that of the earlier Irish and Germans. It might, obviously, be rejoined by Dr. Hourwich's opponents that two generations have intervened in which there has been an extraordinary advance in general well-being; to say that the immigrant of today is as badly off as the immigrant of sixty years ago is to admit that the former really has a lower standard of living. Assimilation does not mean to this writer the melting-pot of inter-marriage, nor even the ability to speak the English language, but an understanding of American ideas. The great increase in number and circulation of foreign newspapers and the growth of foreign patriotic societies are, according to him, signs of Americanization, because the foreigner at home didn't read a newspaper and was forbidden to join a patriotic society. Dr. Hourwich is a disciple of the paradoxical Mr. Chesterton.

Dr. Frank Julian Warne makes a welcome addition to the literature of immigration in *The Immigrant Invasion* (Dodd, Mead, $2.50). This is one of the best volumes that has yet appeared which deals comprehensively with the problem. The author gives every evidence of thoro research in the various aspects of his subject, despite occasional and obvious slips, as when he declares the head tax to be $2 instead of $4.

Moreover, he has the happy faculty of writing forcibly and clearly. A series of excellent diagrams, illustrating the statistical tables, makes possible the easy digestion of this work of scholarship by the average intelligent reader. Dr. Warne agrees with Dr. Hourwich in that immigration is fundamentally an economic problem. Otherwise there is the sharpest disagreement between these two writers. It is Dr. Warne's pessimistic contention that the arrival of vast hordes of foreigners has completely drowned the native workers, and is now threatening to undermine the children of the older immigrants. He is strongly in favor of restriction "so that we can catch our breath and take an inventory of what we already have among us that must imperatively be raised to a higher standard of living and a safer citizenship." In spite of his positive views, the author in no place betrays any dislike for foreigners as such; on the contrary, he strongly sympathizes with the newcomers. He refuses, however, to shut his eyes to what he believes to be the evil effects of unrestricted immigration on American life and character. This writer's alarm at what he terms the "invasion" is perhaps overdone; he strains historical comparison sometimes to the breaking point, as when he likens our present immigration to the invasions of the Huns and German barbarians into the Roman Empire.

That the Italians and Slavs have ousted the natives and older immigrants from the field of common labor is admitted on all sides. But Dr. Warne, quoting the report of the New York State Immigration Commission, shows that the foreigners are now invading the field of skilled labor. In New York City, where unrestricted immigration has done its perfect work, Jews, Italians and Bohemians are rapidly displacing native Americans, Irish and Germans in the trades. Many of the labor journals are now printed in foreign languages.

The conditions of life of the older immigrants two generations ago were admittedly bad, but in assimilating with the Americans they assimilated the latter's standard of living, with the result that the problem was quickly solved. Now, our new immigrants live in colonies away from American influences and in tumble-down shanties or in crowded tenements. Under such circumstances, improvements come slowly, and mainly thru governmental coercion.

The wages of the mill operatives of New England and of the steel workers and miners of Pennsylvania are so low that practically no Americans or older immigrants are employed there. "This competition of the Slavs and the Italians," writes Dr. Warne, "affected the lives of hundreds and thousands of people; it determined the number of births in the community; it influenced powerfully the physical and mental qualities of those born into the world under such stress of conditions."

The Cambridge Manuals

We receive from G. P. Putnam's Sons several more of the little forty-cent volumes of the Cambridge Manuals, namely *Comparative Religions, Ancent Babylonia, The Story of a Loaf of Bread, Ancient Stained and Painted Glass, The Vikings, The Physical Basis of Music, The Earth,* and *The Atmosphere.*

It is remarkable how much can be compacted into 150 pages. The authors are well chosen and competent scholars, who give the substance of knowledge, such that an intelligent man who is no specialist can comprehend it. As an example, the book on *Comparative Religions,* by F. B. Jevons, treats of Sacrifice, Magic, Ancestor Worship, the Future Life and Dualism, in various religions, and gives chapters on Buddhism and Monotheism. That on *Babylonia,* by Principal Johns, covers the history concisely, yet fully, from the beginning of records to the Fall of Babylon under Cyrus. We venture to doubt the statement that the site of Agade, the oldest of the cities of Accad, or northern Babylonia, is not yet identified. It was probably the grand unexplored mound of Anbar.

A Keeper of Royal Secrets

Much of the mystery surrounding the career of Stéphanie-Felicité, Comtesse de Genlis, is laid bare for the first time in the interesting volume called *A Keeper of Royal Secrets* (Brentano, $3.75). The author, Jean Harmand, while excusing nothing, yet presents so much that is favorable as to make her subject a fascinating study. Madame de Genlis was for a time the mistress of Philippe Egalité, and his political adviser. She was placed in charge of the education of his children, and it was the early training she gave to Louis Philippe which prepared him for the part he was to play in the history of France. She had the quality of arousing affection, and the young prince during his *sansculotte* days wrote to her that there were only two things on earth that he really loved—"the Republic and her."

It is as a pioneer of the modern system of education, however, that Madame de Genlis claims our closest attention. Much of what she embodied in her scheme was derived from Rousseau, and she put into practice

the ideas of Madame de Maintenon. The whole tendency of the system so derived was toward utility, and each child was to be made to acquire just as much as its age and capacity warranted. First came the living languages, a daring step in a classical period; sciences, classics, drama, music, a smattering of medicine and anatomy, physical exercise, visits to manufacturies, kindergarten work. Later on, this practical-minded person prepared a curriculum for use in girls' boarding schools. It included religious and moral instruction, the three Rs, English, German and Italian, everything that concerned the management of a house and garden, practice in needlework, etc. Most daring innovation of all, and most interesting in these feminist days, was her wish to instruct her pupils in the management of property, the laws bearing upon wills, inheritance, dowries, guardianships. It was with no idea of making her pupils lawyers or professors that she turned her attention to this. She explains her motive: "When a woman becomes a widow, she quits the modest rank in which nature and the laws have placed her and takes up her position among men; she replaces a citizen, and so doing becomes a citizen herself."

As an author Madame de Genlis has nearly 130 works to her credit; novels, memoirs, diaries, educational, political, theological and historical works, a dictionary, a few volumes of comedy. The themes of the latter are drawn from family affection, the simple life, nature, learning and charity. A devout churchwoman in an age of immorality, she carried on a lively polemic against the philosophers of the period, notably Voltaire, some of whose plagiarisms she was prompt to point out.

It was a chequered career. Married at an early age, she soon became intimate with the future Philippe Egalité, and became a political power and leader of a literary salon. Much of her success as a writer was due to the fact that a rival to Madame de Staël was required. Napoleon gave her rooms in the old Arsenal and a pension, for which she had to write him a daily scrapbook letter on any subject she liked. There is evidence that she was in want, badly treated by her nearest relatives, neglected by her "adopted" daughter, Pamela—who had married the ill-fated leader of the Irish Rebellion of '98, Lord Edward Fitzgerald. With all her faults, Madame de Genlis is an example of extraordinary courage and patience, and she earned a niche in the temple of womanhood, among those who have devoted themselves to the advancement of humanity.

With Master Minds

An opportunity to become acquainted with some of the leading men of the age tho by proxy is afforded thru the collection of interviews issued by the Universal Series Publishing Company under the title *With Master Minds*. The author, Herman Bernstein, never falls into the common fault of interviewers, that of obtruding his own personality in front of the man we want to see. He has, further, the great advantage of not being dependent upon an interpreter. To all of the ten he has met, with the exception of the Sheik-ul-Islam, he was able to talk in their own language. This gives especial value to his interviews with the Russians, Tolstoy, Witte, Metchinikoff, Andreyev and Kovalevsky. Besides those mentioned, the volume includes Bernard Shaw, Henri Bergson, Auguste Rodin, Havelock Ellis and Maximilian Harden.

Literary Notes

The Coming Mexico, described in a rather dull manner by Joseph King Goodrich, is treated less as a subject of prophecy than as one of record. There is a considerable body of historical, statistical and topographical information (McClurg, $1.50).

To the series "Lives of the Players," William Winter contributes a biography of *Tyrone Power* (Moffat, Yard, $1.25). It goes without saying that the book is well written, since it is Mr. Winter's, and that it contains a mass of information not only concerning Power but also about other contemporary actors on the American stage. There are many interesting illustrations.

Sturgis & Walton Company, of New York, have published a number of volumes of French memoirs and now we have *Memoirs Relating to Fouché*, the contemptible minister of police who served Napoleon or any one else who bought his services. Such a volume as this would gain by an index and by better editing. The translation is by E. J. Méras and the price of the book is $1.50.

Japan and Japanese-American Relations is a large book of 342 pages embracing twenty-two notable addresses delivered last year at the Clark University Conference on Japan. While of necessity somewhat repetitious, the book contains much matter of timely interest and gives a pretty complete picture of modern Japan and the great problems confronting her. It is to be recommended without reserve—especially in the present juncture—to American editors. (New York: G. E. Stechert & Co., $2.)

SURVEY of the WORLD

The Hindu in Restraint of Trade

We must not let our amazement at the formation of a Chinese Republic prevent our seeing other changes of more importance to us that are going on in the Orient. Those who do not waste all their business energy discussing the advantages of tariff protection tell us that our real danger in the very near future is going to be an industrial triumph on the part of our yellow neighbors, a triumph that we cannot prevent by racial prejudices or by legislation. An agricultural college is already in operation in Canton, China.

It is not easy to imagine the consequences of combining the mechanical ingenuity of the Saxon stock with the superabundance of labor offered by the Orientals. India, taught by the English, is already in possession of power mills and all the machinery essential to a thoro competition with Lancashire. Nihal Singh, in the *London Magazine,* tells us that this is writing the doom of English manufacture as sure as fate. In 1880 India had fifty-five cotton mills, with one and a half million of spindles, employing nearly fifty thousand men. In 1900 she had three times as many. In 1910 the number of mills had grown to two hundred and sixteen, giving employment to over two hundred thousand persons. Last year these Indian mills consumed six million hundred weight of the cotton that India produced. At this rate India will use up one-half of all her home-produced cotton inside of five years; at the same time giving employment to a large part of the classes heretofore dependent.

It naturally follows that the Hindus favor their home-produced cloths. There is an industrial enthusiasm growing, and awakening the religiously embedded mass, and hurrying them on the footsteps of Europeans. They wear their own home-made cloth, of a coarse texture, exactly as Franklin wore the work of our American looms. It is said that a tariff is not needed in India, because the Indians themselves constitute a tariff wall; they will use home products whatever the price. What will be the ultimate outcome of this competition it is not possible to foresee. We may be sure that high tariffs or low tariffs will not protect us either in New York or in Lancashire. The world is coming into a new sort of age, involving a readjustment of industries, allowing each race to develop its natural power, involving co-operation rather than competition. McKinley was right when he told us that "commercial warfare must end." Call it industrial warfare.

E. P. POWELL.

Raisin Seed By-Products

Over 4000 tons of raisin seeds are wasted every year in California, but the Government has recently shown that these seeds may be made the source of considerable revenue. A very palatable raisin syrup may be made by dissolving the sugary matter adhering to the seeds; this may even be turned into alcohol by simple fermentation and distillation.

The washed and dried seeds may be crushed and treated with a solvent to remove the oil or the oil may be prest out. This clear yellow oil is useful in paint making and in the soap industry and has other possibilities. The dry residue contains considerable tannin, which may be removed by simple extraction with water. Nor is the last residue to be thrown away. It contains a good deal of protein and makes a valuable stock food.

From the 4000 tons of seeds there should be made 550 to 740 tons of syrup, 340 to 460 tons of fixt oil, 330 to 445 tons of tannin extract and 1600 to 2200 tons of meal.

Pagodas and Pendulums

Everybody knows that earthquakes constantly jar Japan, and frequently occur in one part or another of the islands with terrific violence. Many persons must have wondered, then, how the tall picturesque pagodas scattered over the empire have remained standing thru the hundreds of years which many of them count in their history. Each rises six or seven stories, and is top-heavy with spreading roofs, yet earth movements that lay low whole villages about them, and open chasms in the ground, leave them unharmed, or, at any rate, still upright. The secret lies in their construction, which has embodied, since antiquity, the principle of the modern seismograph, which is that of counterbalancing pendu-

lums—the combination of an inverted with an ordinary pendulum. In the hollow well of every lofty pagoda a heavy mass of timber is suspended freely from the top right to the ground, but nowhere in contact with the walls. Under the shock of an earthquake this huge pendulum swings, altering instantly the center of gravity in

NAGOYA CASTLE, JAPAN

Tho built of stone blocks laid without mortar, it has survived more than two centuries in this earthquake country. Note the parabolic curve of the walls.

response to the wave-motion of the ground, and the swaying walls settle back safely upon their base. The same principle is followed in the construction of the bell-towers so common in Japan, where the great bronze bell acts as the pendulum to correct the vibrations of the summit of the tower. A pagoda or a bell-tower may sometimes be rotated, or displaced, but it will never fall.

Another interesting fact in this connection is the existence in Japan of many castles, built hundreds of years ago, which show no sign of the many violent earthquakes the country has experienced. They owe their preservation first of all to their massiveness, and the excellence of material and workmanship in their construction, but largely to the fact that the walls diminish from the broad base upward in the parabolic curve which, as mathematicians show, gives uniform strength thruout; and this curve has been copied in the buildings designed as stations for seismographic instruments. No better example of this can be found than the famous old Nagoya castle, whose walls are built of stone blocks, ten, twenty or thirty feet long, laid up without mortar; yet after hundreds of years there is hardly a crack to be seen. The walls of the castle of Tokyo show the same remarkable preservation, the blocks of uncemented, cyclopean masonry being neither cracked nor displaced in the least degree.

Arbitration for Business Disputes

A little more than a year ago, the New York Chamber of Commerce appointed a committee of arbitration, seeking to substitute for costly and protracted litigation a speedy and inexpensive settlement of such controversies, between persons or corporations engaged in business, as relate to questions of fact rather than to those of law. The undertaking atracted much attention in this country and abroad. In THE INDEPENDENT for April 11 of last year we spoke of the first year's work of the committee. Some time was consumed by a campaign of publicity, in order that business men might know what the committee was ready to do. But there was a good beginning of the work for which the committee had been created. Twenty-two disputes were taken up. In fifteen of them settlements were reached by conciliation, without resort to arbitrators, and at the end of the year seven were pending. The parties to one of the settled controversies were two of the largest firms in the city, and in this case litigation was prevented by the committee's friendly offices. In another, one of the parties being an English firm, a decision was reached in thirty days, at a cost of less than $60.

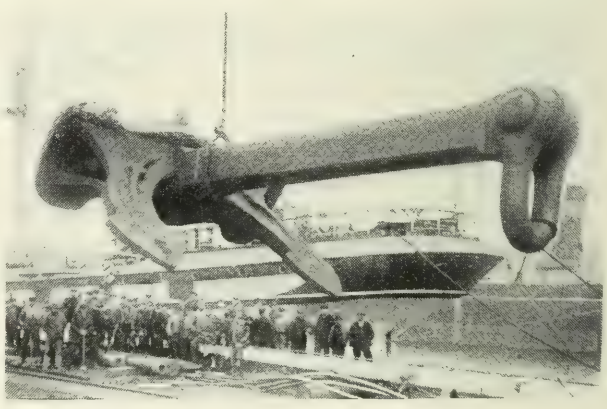
A report concerning the committee's second year has now been made by the chairman, Mr. Charles L. Bernheimer. Several important differences were adjusted before arbitrators, and in addition nearly one hundred business disputes were settled by conciliatory mediation, which involved countless interviews and much corespondence. In many cases, however, the mere offer of arbitration was enough to bring the disputants together and open the way for an agreement. There was a great variety of subjects, ranging from Panama hats to shoes, from seeds to silks, from building contracts to lawyers' fees.

In one case a business man and his attorney were at variance concerning the latter's fee. Litigation in court would have been harmful to both—to the business man because it would have disclosed trade secrets, and to the lawyer because a question as to his professional ability was involved. Arbitration by means of the committee was greatly to be desired because it combined privacy with justice, quick action and economy. There are now before the committee cases concerning disputes between American and foreign merchants. The latter, whose dealings with American houses are sometimes restricted by dread of

CHARLES L. BERNHEIMER
Chairman of the Committee of Arbitration of the New York Chamber of Commerce, which has completed an influential year's work.

litigation in a country of which they are not citizens, see that the committee offers satisfactory adjustment without delay and at very little cost.

The committee has striven to make its system a pattern for other chambers of commerce, and to inspire thruout the country a public sentiment favoring conciliation and arbitration. Its example is to be followed by the recently established United States Chamber of Commerce. By addresses, pamphlets and correspondence it has set forth the advantages of arbitration. On account of these efforts, similar committees have been appointed by the Rochester Chamber of Commerce and the Silk Association of America. It is urged by the committee that its method of adjustment should be followed with respect to disputes concerning the purchase of supplies by the Government. The number of bidders for supply contracts has been restricted by the fear of some merchants that disputes may arise and that there may be no redress except by a lawsuit, with its delays and expenses.



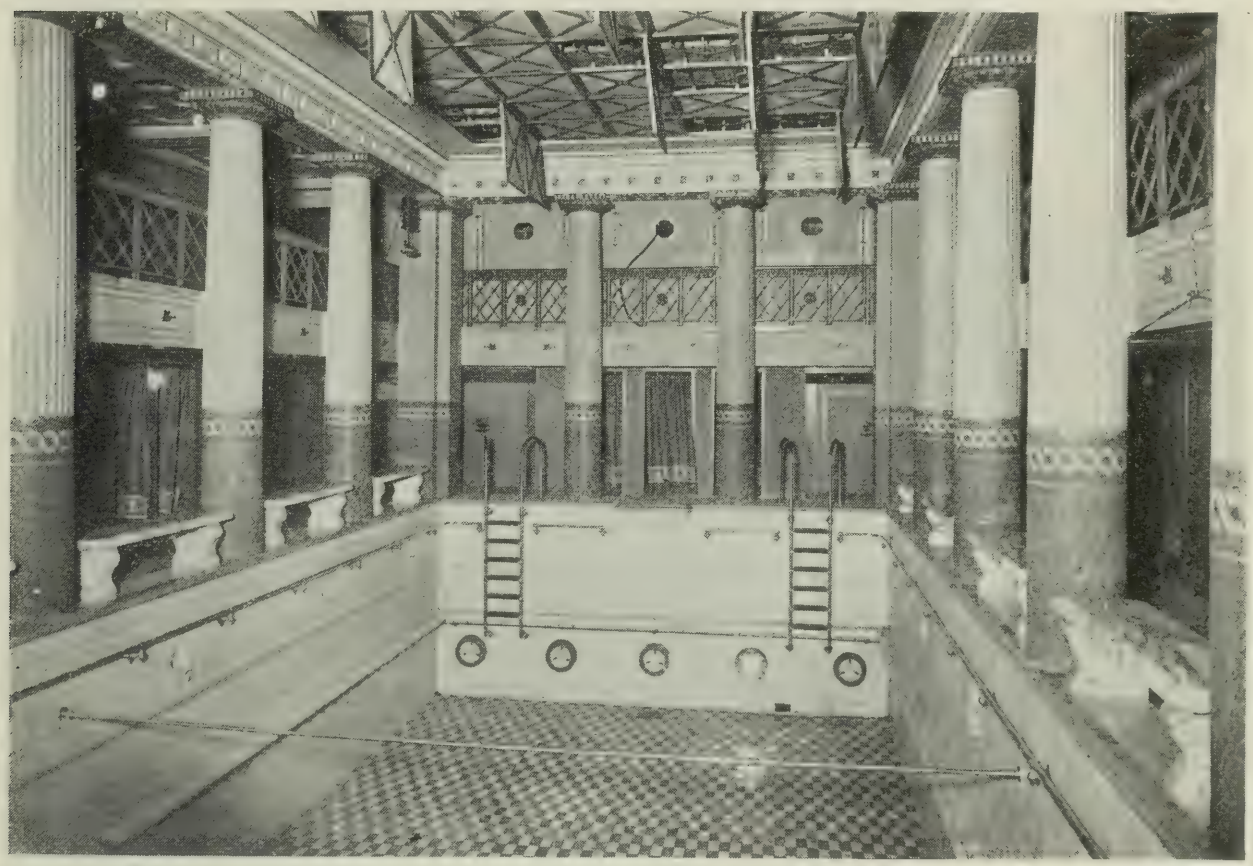
If the Government will only encourage arbitration in such disputes (we are aware legislation to that effect may be necessary) the number of bidders on Government contracts will be increased, hence the price and terms will become more favorable. Greater economy would here be possible in our Government expenditure.

It is not only in business disputes that the committee has exerted its influence. Immediately after the beginning of the great strike in the clothing trade of the city last winter, it set out to use its friendly offices in bringing the contending parties together for a settlement. It did bring them together, and there were daily hearings for a week in the committee's rooms. Altho the strike was not ended by these efforts, the settlement made eight weeks later was upon terms substantially in accord with those which the committee had suggested. In these negotiations the committee was assisted by Dr. Jeremiah W. Jenks, of the Efficiency Society, and by Mr. Marcus M. Marks, the head of the conciliation department of the Civic Federation. It is ready to use its influence in adjusting differences between employers and the employed.

But its chief field is that in which differences arise between business men. There it saves much time and cost. Privacy for hearings and results is assured. Arbitrators are sworn in, witnesses are heard under oath, and testimony is recorded by a court stenographer. While the law says that contestants who are successful may file the award in the State's Supreme Court and obtain judgment thereon, and that the court may correct errors which do not affect the merits of the finding, thus far there has been compliance with the arbitration decisions, without any application to the court.

The Liner Imperial

They call her the *Imperator*, the newest biggest ship, just arrived at New York for the first time. But it's not because she has accommodations for two emperors at once —should two potentates ever deign to occupy the twelve-room-and-private-deck apartments which are dubbed by her Hamburg-American owners the Imperial suites.



THE IMPERATOR'S GREAT ANCHOR

She is herself more imperial than the proudest passenger she will ever carry.

Six of her, end to end, would more than cover a mile; she measures 919 feet, is 98 feet wide, and has a tonnage of 50,000. She carries the amazing quota of food supplies that the press agents have made familiar: 800 pounds of mushrooms and 400 pounds of tea, for instance. First and second cabin passengers have each a gymnasium; the staterooms; deck-space is added by the removal of ventilating funnels. The circuit of the deck takes one a distance of five city blocks.

"Yo-heave," as applied to the anchor, is a rather appalling remark when the main anchor weighs 26,455 pounds and it takes three-quarters of a mile of chains to manipulate that and four auxiliary anchors. But under the new dispensation only the ma-

MIXING ROMAN ART, GERMAN ENTERPRISE AND YANKEE LUXURY ON THE IMPERATOR

Roman bath must needs be a faithful copy of the Pompeiian hall in the Louvre Museum, with a dozen improvements on Roman bathing facilities besides.

This year—and for more than one year to come—one looks first to learn what makes for the safety of a new sea palace. Sixteen steel bulkheads, forming thirty-six water-tight compartments, each thoroly tested, eighty-three large life-boats, accommodating every one on board (two of them high-powered motor boats with wireless equipment), new types of apparatus for handling the boats—these are some of the pledges of safety on the *Imperator*.

As for comfort, the Schlinger tanks or wave-motion absorbers—which have worked remarkably on small steamers, reducing the rolling motion from thirteen degrees from the vertical to less than three—will be tried out on this mammoth. Beds replace berths; telephones are placed in all the first cabin chinists, of all the crew of 1180, have cause to worry about such matters. And the passengers—they will hardly have time to explore to their satisfaction in the six-day trip.

The American Bison

The distinguished director of the New York Zoological Park, Mr. William T. Hornaday, says that the American bison is now reasonably sure against extinction. This is due to the fact that it breeds persistently and rapidly in captivity, and to the untiring efforts to preserve it put forth by the United States and Canadian Governments, the American Bison Society, the New York Zoological Society and several individuals.

In 1889 the species had reached its minimum. Then there were only 256 head in captivity and 835 running wild. Last year there were estimated to be 2907 in North

America. Today there are 1365 in captivity, distributed as follows:

In the United States.

Yellowstone Park fenced herd, founded by Congress	125
Montana National Bison Range, founded by the American Bison Society	69
Wichita Bison Range, founded by the New York Zological Society	39
Wind Cave Bison Range, S. Dakota, founded by American Bison Society	To be stocked
Niobrara (Neb.) National Bison Range, now in process of creation	To be stocked

In Canada.

Buffalo Park, Wainwright, Alberta	1,052
Elk Island Park, Alberta	53
Rocky Mountain Park, Banff, Alberta	27
Total National and Provincial preserves	1,365

Of wild bison there are only three groups: 49 head in the Yellowstone National Park. 75 in the Montana Bison Range, and between 300 and 400 in northern Athabaska.

The 1912 Haze

From all over North America and Europe come reports of the strikingly hazy condition of the sky that prevailed persistently from early last June to the latter part of last year, and possibly longer. Even on cloudless days the sky presented a filmy whitish appearance, and its diminished transparency was everywhere noted by astronomers as an impediment to the observation of faint celestial objects. The disturbance, whatever it was, must have prevailed at a considerable altitude above the earth, as it was observed from mountain tops and balloons.

The haze was first noticed in the United States from June 8 to 10, and appears to have reached its maximum intensity about June 20-25. In Europe it was not generally observed until about the 20th of the same month. There is much diversity of opinion as to when the phenomenon came to an end; some observers even claim that traces of it are still visible.

Sunrise and sunset colors in the United States during the autumn of 1912 were more brilliant than usual; the red shades being especially pronounced.

These circumstances appear to indicate the presence of a widespread veil of fine dust in the upper air. It is hardly doubtful that this dust came from the eruption of Katmai Volcano, in Alaska, on June 6, 1912, and was rapidly spread over the world by the wind. The same eruption was followed by a fall of volcanic ash over all of southeastern Alaska and the northwestern United States.

A similar prevalence of haze or "dry fog" has followed other great volcanic eruptions. The most famous case on record is that of the dense fog that prevailed all over Europe, and to some extent elsewhere, thruout the summer of 1783, after the gigantic eruptions of Asama, in Japan, and Skaptar Jökull, in Iceland.

The Paterson Strike Pageant

Pageant? Oh, yes, you say. A pretty thing—antique costumes and gay palfreys, a picturesque procession winding across a leafy lawn, the most eligible young men and girls of the village presenting the stirring scenes of their great-grandfathers' days.

But this was a pageant of a different order.

It was not pretty. There were no brilliant costumes; all the action took place in the dingy arena of Madison Square Garden on June 7; a full thousand striking silk workers—Industrial Workers of the World—took the parts. And the episodes they played they had themselves lived within the past three months. Rabbi Mannheimer told the story in the May 29 INDEPENDENT.

Across a huge stage at one end of the hall was hung a drop picturing the dismal front of a silk mill in Paterson. Into its wide door there trooped at the blast of a factory whistle—for the first "episode"—the throng of workers, coat-collars turned up to suggest the chill of an early February morning, otherwise in ordinary working clothes. "The mills alive—the workers dead," the program reads. Silently and cheerlessly they pour into the factory—then from within comes a shout; the crowd bursts out on the stage, intoxicated with sudden freedom. "The workers begin to think," is the legend. The silk strike is on. Down from the stage and the entire length of the main aisle the workers march, cheered all the way by the sympathetic audience of 15,000, workingmen and their families.

"The mills dead—the workers alive," the second episode, shows the line of quiet, determined pickets patroling the entrance to the deserted mill. As they halt the few "scabs" who appear, the police rush up and a scuffle begins. General clubbing (and the shooting by the police of a bystander, Modestino, not staged) ends in arrests. The police march their captures down the long aisle again, while the audience "boos" and hisses.

It is an unequaled device for clutching the emotion of the audience—this parade of the actors thru the center of the crowd. The dramatic liturgy of the Roman Church, in

which our English drama had its rise, the processional in the Episcopal Church, too, and even the familiar wedding march, recognize its value. Rarely it has been used in New York theaters—in "Sumurun" last year, and in one or two other cases, but never with more effect than in this performance, where actors and audience were of one class and one hope.

To funeral music, the procession returned from the back of the hall for the third episode. Hisses greeted the police officer who headed the line, for behind him came the coffin of Modestino, carried by strikers, and followed by the thousand. On the stage the strikers gathered about the coffin, covering it with carnations, "the crimson symbols of the workers' blood," and then listened to Tresca and Haywood, who spoke as they had spoken at the actual funeral in Paterson.

Songs in German, Italian, and English—songs which have grown out of the strike—were sung at the mass meeting of the fourth episode. The Marseillaise and International were heard, too, the latter the stirring tune which has captured the I. W. W. with its refrain:

'Tis the final conflict,
Let each stand in his place,
The Industrial Union
Shall be the human race.

It was a replica of the May Day parade that carried the strikers through the audience for the next episode. Reaching the platform, they listened to Elizabeth Gurley Flynn, who told how the strikers, pinched by the long wageless period, were sending their children to "strike mothers" in other cities. The youngsters, many dressed in flaming red, were given again to the New York women who had been caring for them, that they might have "the roses put in their cheeks and class solidarity in their hearts."

Last came a strike meeting, with speeches from leaders. Here the strikers "legislated for themselves." They determined on an eight-hour day, and says the program, "no court can declare the law thus made unconstitutional."

There was no plot—no more than in the crude Elizabethan history-plays. There was no play-acting. The strikers were simply living over, for their fellows to see, their most telling experiences. No stage in the country had ever seen a more real dramatic expression of American life—only a part of it, to be sure, but a genuine and significant part. In its own fashion it was as simple as the primitive drama of the sixteenth century. "Jack" Reed, associate editor of the American Magazine, who with Lincoln Steffens was responsible for the idea, stood in front of the crowd and stage-managered with a megaphone. There was no curtain; the stage, unlocalized save for the drop, became in turn the street, Haledon (a nearby village) and Turn Hall in Paterson, quite as freely as a pre-Elizabethan inn-yard.

It was not a pageant of the past; but of the present—a new thing in our drama.

A "RIOT" ACTED BY THE "RIOTERS"

The Paterson strikers, in the second episode of their pageant, are picketing, and are just coming into collision with the police.

Fifty Years Ago

From **The Independent,** June 18, 1863.

THE UNION PACIFIC RAILROAD

By Horace Greeley.

An organization of the Pacific Road has been effected, under the generous terms proffered by Congress, which secures the certain and early completion of this grand, beneficient enterprise. There will be no lack of means; and John C. Fremont is President of the Company, which guarantees the requisite energy and determination. Foreign capitalists of boundless resources have been enlisted in the undertaking through the influence and zeal of Samuel Hallett, the banker, who has been chosen Vice-President. Yet a little while, and the Iron-Horse will be careering in triumph across the Plains and the Mountains, and men will quietly take their seats on Monday morning at New York, in doubting assurance that they will dine the following Saturday with their friends in San Francisco.

STONEWALL JACKSON.— This journal has been considerably criticised for its obituary notice of Stonewall Jackson. We have been charged with speaking too well of that brave man. But if some recent intelligence be true which we hear reported from the other world, our remarks stand abundantly justified. *The Herald of Progress,* a Spiritualist paper of this city, says that Stonewall Jackson has become an Abolitionist since his death, and has joined John Brown's phalanx of philanthropists.

Pebbles

She—Why do you work so hard?

He—I am too nervous to steal.—*Cornell Widow.*

Grace—I told him he must not see me any more.

Her Brother—Well, what did he do?

Grace—Turned out the light!—*London Opinion.*

Bertie—I've been having a lovely game with this post-office set you gave me, auntie. I've taken a real letter to every house in the road.

Auntie—How nice! And where did you get all the letters?

Bertie—Oh, I found a big bundle tied up with pink ribbon in your desk.—*Punch.*

A SACRED VOW THAT SEEMS TO BE LOSING SOME OF ITS SIGNIFICANCE

—From the Chicago *Daily Tribune.*

THE WEEK

The Tariff Investigation

In the Senate's inquiry concerning a tariff lobby, last week, much testimony was given by agents and representatives of the Hawaiian and Louisiana planters and of an association of producers of beet sugar. Among these was ex-Governor Carter, of Hawaii, who predicts that, with free sugar, the islands would be little more than a military post. Witnesses from Louisiana claimed that they had been misled as to the views of President Wilson. Figures showing the expenditures of the several agents and associations were given, with statements as to manner in which the money had been used. The beet sugar agent showed that more than a million copies of an argument against removal of the duty had been circulated by mail. Senators' franks had been used, notably those of Senators Lodge and Smoot, the argument having presented in a speech by Mr. Lodge and printed in the *Congressional Record.* By the use of franks $28,000 in postage had been saved.

It is expected that the bill will be reported to the Senate on the 23d inst. The Finance Committee estimates its average ad valorem rate at 32.99 per cent, against 43.04 per cent under the present law. Additions to the free list cause a loss of $24,718,000 of revenue. The House provisions as to wool and sugar have been approved by the committee, but the proposed preferential concession of 5 per cent on goods imported in American ships will be dropt, at the President's suggestion, it is said. It would violate many treaties.

Equal Suffrage

The Illinois House, on the 11th, by a vote of 83 to 58, past the bill giving to all women who are citizens of the United States and twenty-one years old the right to vote for the nominees for all offices in that state which were created by statute. In the Senate the bill was past some weeks ago. It will be signed by the Governor and the law will be in force on July 1. The limitation prevents women from voting for Governor, United States Senators, Representatives in Congress, members of the Legislature and nearly all of the judges. Leaders of the movement will now work for a constitutional convention by which the limitation may be removed.

In the Senate at Washington, last week, the Committee on Woman Suffrage reported a resolution for a constitutional amendment extending the right of suffrage to women. The amendment would provide that the right to vote shall not be denied by the United States or by any state on account of sex. For the passage of such a resolution a vote of two-thirds is required. It is said that at present not more than thirty of the needed sixty-four votes can be found. Action will not be sought before the December session.

Trust Cases

The Government has brought a suit at Buffalo, under the Sherman act, against the Eastman Kodak Company, of Rochester, asking that dissolution be ordered on the ground that the company is maintaining an unlawful combination and a monopoly with respect to photographic cameras and supplies. President Eastman says the company is willing to change its methods. There is no indication that a dissolution will be effected before the trial.

At Chicago, the Quaker Oats Company has been subjected to a similar prosecution. The court is asked to pronounce the company an unlawful combination and to restrain it from engaging in interstate commerce, unless its objectionable methods shall be abandoned. The bill of complaint mentions Myron T. Herrick, Ambassador to France, as a director who took part in organizing the company, or a corporation connected with it, some years ago.

The Supreme Court has set aside the judgment against five officers of the American Naval Stores Company, or Turpentine Trust, of Savannah, owing to erroneous instructions given by the trial judge. All of the five had been fined, and three of them had been sentenced to be imprisoned for three months.

The Panama Canal

Colonel Goethals, chief engineer of the Canal, has come to Washington. It was reported that he would ask to be withdrawn from the Canal service, owing to friction

with members of the commission. It appears, however, that he will remain until the work is completed, and that his authority is not to be impaired. He has the support of President Wilson and the Secretary of War. Italy has joined Great Britain in opposing the exemption of our coastwise shipping from payment of tolls, and in asking that the question be submitted to arbitration.

Colonel Goethals says that a vessel of some kind will go thru the Canal on or about October 15 of the present year. Replying to a question whether a warship could pass at so early a date, he said that would depend upon the gravity of the emergency.

Alaska

Members of the Senate Committee on Territories have been asking the President to approve a movement for the passage of the bill appropriating $35,000,000 for the construction of railroads in Alaska. He agrees with them as to the proposed legislation, but is not yet convinced that consideration of it at the present session should be recommended, because the tariff bill is pending and a currency bill is to be taken up.

At Seward, Alaska, on the 10th, the rolling stock and trackage rights of the Alaska Northern road were turned over to a committee of business men to be used for the benefit of the public, because of a demand by the Federal Government for $67,000 in taxes. The company asserts that it was relieved of the payment of these taxes until 1916. The committee is paying employees for operating cars in which supplies are carried from the coast to miners and settlers in the interior.

Several volcanoes are still in eruption. A great column of flame rises from one on Unimak Island. An officer of the Smithsonian Institution expresses the opinion that the dust from these volcanoes will reduce temperature in the United States.

A Battle in the Philippines

For some time past the Philippine Government has been striving to disarm the Moros. This work was in the hands of General Pershing, commander of Mindanao. A considerable number refused to give up their arms. They intrenched themselves on the steep side of a volcanic mountain on the island of Jolo. There they were attacked on the 12th by a force of cavalry, infantry and scouts. The battle was a fierce and desperate one. The Moros were beaten and many were killed. They fought in a fanatical and reckless way, believing that they were sure of preferment in Heaven if they should lose their lives in attacking Christians. On the American side six were killed. One of these was Captain Taylor A. Nichols, of the Philippine Scouts.

At the first annual dinner of the Philippine Society, in New York last week, Ex-President Taft, formerly Governor of the islands, spoke earnestly against the proposed grant of independence. He suggested that the Democratic party should send a competent commission to the islands before taking action in accord with promises made long ago. He was willing to abide by the result of such a commission's inquiry. Another speaker, Delegate Quezon, asked for independence and urged that steps for a speedy granting of it should be taken without delay.

South America

The reported discovery of a plot for the assassination of the President of Venezuela was followed by the imprisonment of General Chalbaud and many others. Chalbaud's friends say there was no plot and that he was imprisoned because President Gomez feared he would be a formidable candidate for the Presidency. The President's dispute with the Federal Council, several members of which sought safety in flight, was due to the Council's disapproval of an agreement with France, which was approved subsequently by Congress. It was signed on the 14th, and diplomatic relations with France, suspended for several years, were at once resumed.

In Argentina, the complaints of the Anglo-Argentine beef companies against the companies controlled by the great Chicago packers have not moved the Government to attack the latter. It was alleged by the complainants that the American companies were seeking to establish a monopoly, but the evidence to support this assertion was not regarded by the Government as conclusive. A small consignment of Argentine beef was received at New York last week from London. Large shipments to London from Argentina by the American companies had glutted the market and deprest prices, and this shipment to New York was made by speculators. The beef was sold at about 1½ cents a pound below the price of beef received from the West.

Dr. Lauro Muller, Brazil's Minister of Foreign Affairs, arrived at Norfolk, last week, on his country's largest battleship, which was met and escorted into Hampton Roads by three American battleships and three destroyers. He was greeted by Secretary Bryan, Senator Root and the Brazilian

Ambassador. He has since been entertained in Washington. One day last week he made a pilgrimage to Mount Vernon and laid a wreath on the tomb of our first President.

Cuba

William E. Gonzales, editor of the Columbia, S. C., *State*, who has been appointed Minister to Cuba, is the son of a Cuban patriot. Senator Tillman's consent to his nomination marked the end of a feud between the Tillman and Gonzales families. N. G. Gonzales, brother and partner of the new Minister, was shot and killed by the Senator's nephew, then Lieutenant Governor of South Carolina. While Mr. Gonzales is acceptable to the Menocal Government in Cuba, it regrets the withdrawal of Minister Beaupre. The latter was slandered some time ago in a paper owned and edited by Congressman Soto. In the Cuban House, last week, Soto made a partial and unsatisfactory retraction. He did not express regret for having called Mr. Gibson, Secretary of the American legation, an embezzler and a drunkard. Two days later, however, a complete retraction and an apology were offered to both the Minister and the Secretary in Soto's paper.

The new Government continues to find evidence of maladministration during President Gomez's term. In the public works department there are heavy liabilities for which no funds were appropriated.

British Politics

The Irish Home Rule bill past its second reading in the House of Commons, June 10, Mr. Balfour's motion to reject it failing by a vote of 270 to 368. Bonar Law, the Unionist leader, threatened a direct appeal to the people, and hinted at a bargain between the Government and the Irish Nationalists. The premier and Mr. Redmond both emphatically denied that there was any "bargain." The police continue to seize arms and ammunition apparently intended for the Ulster loyalists who oppose Home Rule and threaten armed resistance. Seizures have been made at London as well as at Belfast and elsewhere.

The parliamentary committee which has investigated charges of corruption in connection with contracts between the Government and the Marconi Wireless Company made its report on June 13 and entirely exonerated Attorney General Sir Rufus Isaacs, Chancellor Lloyd-George and Postmaster General Samuel. A draft report proposed by the leader of the opposition minority in the committee, Lord Robert Cecil, concedes that no minister or government official had been influenced in his public duties by an interest in the Marconi undertakings, but declares the ministers concerned to have acted with grave impropriety. The draft report was negatived in committee by a vote of 6 to 8. The charges of Cecil Chesterton, a journalist, brother of G. K. Chesterton, led to his recent conviction of libel. Since then, however, the Unionists have revealed the fact that Lord Murray of Elibank, the former Liberal whip, now in South America, invested both his own funds and some $47,000 of his party organization's in wireless stock. This is made much of by the Unionist Opposition, who have hopes of upsetting the Liberal government by means of the wireless scandal, and thus staving off the final vote upon Home Rule by the Commons, and its submission to the House of Lords.

Emily Wilding Davison, the suffrage manifestant who lost her life at the Derby races on Epsom Downs, was accorded a funeral procession in London on the 14th. Bands, and a long procession of women, figured in the demonstration. The street crowds were well behaved. On Sunday the 15th, however, members of the Women's Social and Political Union were roughly treated at their meetings in Hyde Park.

European Notes

On June 11 the Storthing past a bill enfranchising Norwegian women.

The elections to the Folkething, or lower house of the Danish Parliament, on May 20, resulted in a Socialist-Radical victory, owing to disagreement among the members of the Government on constitutional reform. The present electoral system, with its privileges for a small class of landed proprietors, is decidedly unpopular, and roughly resembles the system which prevailed in Great Britain before the Reform Act of 1832. The new Folkething is likely to modernize the constitution.

The Count de Romanones, Spanish Premier, has again resigned, with his ministry. This was in view of a split in the Liberal party, of which he is leader. In spite of his opposition, the Senate past, on the 10th, a bill giving modified home rule to Catalonia by a vote of 111 to 97. The King asked the Prime Minister to form a new cabinet, and he has done so, naming Señor Lopez Munos Foreign Minister. The Cortes adjourned on the 14th.

One of the Spanish gunboats despatched to Morocco, to allay disorders in the Spanish zone, went ashore on June 12, and Kabyle tribesmen opened fire on her decks.

Some reports allege that most of the crew of 100, including the commander, were slain; but this report is contradicted, and the loss is said to be only fourteen. The cruiser "Reina Regente" was sent to the succor of the gunboat ("General Concha") and dispersed the tribesmen, killing nineteen and wounding many more. Fighting in French Morocco also is reported, and the ambushing of a column under Colonel Magnin in the Tabla region, 100 miles from Marrakesh, is said to have cost the French a loss of 64 dead and 109 wounded.

A bomb thrown at Lisbon on June 10 killed one and injured thirty-three persons. This occurred while a procession was honoring the greatest of Portuguese poets, Camoens, in accordance with the annual custom. On the same day members of the Portuguese colony in Paris bore wreaths to adorn a new statue of Camoens. They were astounded to find only an empty pedestal, and had to deposit their flowers on the Victor Hugo monument nearby. The municipality is said to have found the Camoens statue below the city's artistic standard.

The Belgian government proposes to borrow $62,800,000 to defray military expenses. "We don't doubt the loyalty of the nations which guarantee our neutrality," says the premier; "on the other hand, we don't propose to supply again a battlefield for Europe."

The Hungarian cabinet has resigned in consequence of the acquittal of Deputy Desy, who was sued for libel by the Premier, Dr. von Lukacs, after he had called him "the worst Panamite in Europe." The word "Panamite" was an illusion to the French Panama scandal, and the Opposition deputy accused the Hungarian Premier of selling private property to the state of which he is the parliamentary chief at an enormous profit, besides securing a loan of $700,000 from the Bank of Hungary for political purposes. Deputy Desy was condemned when the libel suit was first heard, but was acquitted when it came before the High Court. The newer verdict is immensely popular in Budapest. On the 4th, the day following the court's judgment, there was a riot in the Hungarian Chamber.

Italy, too, has a graft scandal, in which the construction of a Palace of Justice afforded the opportunity. A vote of the Chamber of Deputies, on the 3d, endorsed by a majority of 230 the Government report censuring Signor Zanardelli, three former Ministers and five Deputies for consenting to the graft. Signor Chiesa, Socialist, made charges against Government engineers and others in connection with the raising of the colossal Victor Emmanuel Monument in Rome.

Colonel Redl, one of the chiefs of the Austrian army's secret service, was lately found to have betrayed certain draft plans to Russia. He was not placed on trial, but was called upon by two officers, who told him of his incrimination, left a loaded pistol on the table, and withdrew. The Colonel took advantage of the opportunity thus presented, and committed suicide. The facts leaked out in spite of the War Office's determination to suppress the scandal, and now it is reported that the treason was not confined to Colonel Redl, and that twenty Austrian officers are under surveillance, while the same number of Russian spies have been secretly arrested in various parts of the Austrian Empire.

A complete breach between the Russian government and the Duma is reported. The cabinet has resolved that neither ministers nor heads of departments shall appear in the legislature until conditions guarantee them against insult by members of the Duma. The immediate cause of the decision is the interruption of an address by the Minister of Finance, M. Markoff, a reactionary member of the House, crying out: "Stealing cannot be tolerated!" The ministers left the Duma in a body after M. Markoff added that his remark applied to all the officials of the various departments. Recent despatches refer to a state policy of repression that angers radicals in Russia.

Concerning Airships

Accepting the Austrian Emperor's invitation, Count Zeppelin in his dirigible balloon "Sachsen" paid a visit to Vienna on June 9. Starting from Baden-Baden at 5.30 a. m. Count Zeppelin reached Francis Joseph's capital at 1.30 p. m. There were twenty-four persons aboard the airship and 430 miles were covered at the rate of fifty miles per hour. This is the seventeenth Zeppelin balloon.

A French airman, Marcel Brindejonc des Moulinais, leaving Villacoublay, near Paris, at 4 a. m. on June 10, reached the Johannisthal aviation ground near Berlin shortly after noon, and Warsaw at 6.15 p. m. His journey from Paris to Warsaw covered 900 miles. On June 15 Brindejonc continued on his flight toward St. Petersburg, covering about 225 miles more. He is out for the Pommery prize of $2000.

German military aviators are in the future likely to be punished by a minimum penalty of two weeks' close confinement in the event of their crossing a foreign frontier in their aeroplanes or airships. This

order was issued by the War Office at Berlin on May 14. The French Government had suggested that Germany do something to discourage such incidents as have lately occured at Lunéville and elsewhere. Prizes were awarded last month in the "Prince Henry Flying Competition," including military reconnaissance flights from Strassburg to Freiburg and back. The first prize $2500 went to Lieut. von Hiddenssen.

A Swiss aviator named Bider, who flew over the Pyrenees in January, has made his first flight over the Bernese Alps. And the world's record for altitude for an aeroplane carrying a pilot and passenger was broken at Buc, France, on June 3, when Edmond Perreyon attained a hight of 16,368 feet, or 3 1-10 miles. This airman holds the record also for hight attained with no passenger—19,650 feet. This flight was made last March, also at Buc—where, on June 5, a Frenchman named Bernard was killed when his biplane turned turtle in midair.

In the Balkans

The danger of war between Servia and Bulgaria, with Greece and Rumania undoubtedly taking part, was reduced somewhat when the Czar of Russia sent telegrams to the Servian and Bulgarian rulers reminding them of their agreement to let him arbitrate their territorial differences, and adding that Russia would not view that "fratricidal conflict" with indifference. Both governments agreed once more to accept Russian arbitration.

A Turkish Assassination

Mahmud Shevket Pasha, Grand Vizier of Turkey, was assassinated in Constantinople on June 11. His aide, Ibrahim Bey, was also killed by the rain of bullets poured from another motor car into the Vizier's automobile. Martial law was declared, and Foreign Minister Said Halim was named as Shevket's successor. Next day the Grand Vizier was given a pompous funeral, in which most of the garrison participated. Arrests were made also, in the course of which Lieutenant Hilmi Bey, engaged in the capture of the supposed assassins, lost his life.

Shevket Pasha's fame has been established within five years. As military leader of the Young Turks he played a great part in the overthrow of ex-Sultan Abdul Hamid—who all the same had looked upon him with favor. "The sword of the revolution," as Shevket was called, was an uncommonly handsome and undeniably vain Arab of ancient line, a native of Bagdad. After studying in the national military college he completed his military training in Germany. Tho he had lost the popularity gained in the revolution, Shevket was a tireless worker and fearless in the face of danger. His assassination was in revenge for the overthrow of the Kiamil ministry and the murder of Nazim Pasha, on January 23, 1913; a murder in which he denied complicity. This coup brought about the return to power of the Young Turks. Shevket was about sixty years of age.

WHERE BULGARIAN AND SERVIAN CLAIMS CLASH

In March, 1912, Bulgaria and Servia made by treaty a rough division of the territory they expected to take from the Turkish Empire. The tentative boundaries of their respective spheres are shown by dotted lines; the shaded area between these frontiers was to be divided between the states by the Czar. Servia now claims that the conditions which have arisen are entirely different from those contemplated by the treaty—which was drawn in anticipation of an autonomous Macedonia—and demands a fresh settlement of the whole territorial question by all the Allies together. Bulgaria has insisted upon the literal execution of the treaty. A complete rupture seemed imminent; but the states have now agreed to submit to the Czar's arbitration.

IN THE INSURANCE WORLD

BY W E. UNDERWOOD

The Missouri Deadlock

The situation precipitated by the enactment of the Orr law in Missouri and aggravated by the hostile policy followed since by the Governor and Attorney-General of the state, remains about as it was when the subject was last treated in this department several weeks ago. None of the fire insurance companies which suspended business on April 30 have resumed operations, nor is it believed now that they will do so unless the objectionable statute is repealed. From this distance the differences between the companies and the state officials seem irreconcilable. In the meantime, the business interests of the state are restless, dissatisfied and apprehensive. As time and existing policies lapse, the danger to credit increases. Every day the outstanding insurance protection against fire dwindles without means to replace it. Every day the companies pay losses but receive nothing in the way of income from that territory. The endurance test is not between the principal disputants, for the legislators and state officials are not suffering, but between property owners who are not in sympathy with the law and the companies which cannot safely continue business under it. The politicians are diverted, perhaps entertained, by the contest, which is being paid for in hard cash by the unwilling victims.

Life Insurance Soliciting

At the May dinner of the Life Underwriters' Association of New York, while discussing the proposal for a pledge on the part of every member, with the object of improving the ethics of the business generally, and the conduct of solicitors particularly, one member is reported as stating that he favored the enactment of a law which would provide that the license of a solicitor would not be renewed by the State Insurance Department unless the solicitor had secured half a dozen cases during the previous year—meaning that he had sold policies to that number of persons. This states in another form the objection made by some men in the business to the employment of what are called "part-time agents," persons who combine with life insurance soliciting the discharge of other duties. A capable and ambitious young man, clerking in a real estate office, sees an opportunity to make $200 or $300 a year by writing life insurance in his spare time. Because he does not give up his salary and devote himself wholly to life insurance, he is objectionable. He is a "part-time" man. We are not in sympathy with that principle. The door of opportunity in any given direction should not be barred against men who are not strong enough to abandon a certain income for an uncertain one. The life insurance people should put character in the servant above and in place of the amount of time he can devote to the service. The honest, truthful man who succeeds in selling just one policy a year, is every bit as worthy as the one who sells a hundred, and infinitely superior to some "successful" solicitors who are hardened in the matter of the representations they make.

Legislative Victims

Last month the Teutonia Insurance Company of New Orleans sold out its business to another fire insurance company and retired from the field. The Teutonia was organized and commenced business in 1871, and while continuously in the class of smaller companies, enjoyed a good reputation because of its careful and conservative management. Its home office and field officials and managers, tho not brilliant underwriters, were industrious, faithful and discreet. The financial statement of the company at the close of 1912 shows it had total admitted assets of $1,118,067; total liabilities, including $250,000 of capital stock, of $947,059; and a surplus for the protection of policyholders of $420,978. It has held its own very well for forty-two years. Why did it retire?

In explanation of the withdrawal the president of the company states that burdensome state legislation decided the directors to go out of business. After careful consideration they found that to continue in the thirty states in which they were operating it would be necessary for the stockholders to pay in more money, and that as there are few certain profits and the contingency of heavy losses, further investments in the venture were imprac-

ticable. "There is no money in the insurance business any longer," observes President Noll, "the companies make their money off their investments. We decided after a canvass of the situation to retire while we could do so on a profitable basis rather than take a chance of losing."

The Teutonia was a serviceable company to business interests, and it is a country-wide misfortune that corporations of its character are forced out of existence by unwise legislation. Let the thoughtful citizen contrast the public policy in this respect of Connecticut, with its $94,000,000 of invested assets in fire insurance companies, with such wealthy states as Illinois, Ohio and Missouri. Why have neither of the last three even one great company? Read the laws of all. And who can impeach the standing and management of the Connecticut companies? They have no superiors in the world.

Insurance Thru the Y. M. C. A.

As the result of an arrangement made between the directors of the New York City branch of the Young Men's Christian Association and the Aetna Life Insurance Company, the members of the former may secure life, accident and health insurance in combination at a reduced rate. The insurance, to be issued in units, will include $1000 of ordinary life; $2000 accident insurance; $10 a week accident disability indemnity; and $10 a week indemnity for disability from ordinary sickness. Unless the applications for these policies reveal suspicious indications of poor family history, or there are other unfavorable facts, no physical examinations will be required. Members of the association may apply for as little as a half unit ($500 life, $1000 accident, $5 a week accident indemnity and $5 a week sickness indemnity) or as much as seven and a half units ($7500 life, $15,000 accident, $75 weekly accident and $75 weekly sickness indemnity). For applicants whose occupations are classed by the company as preferred or better, the cost will be much below the schedule rates, and this advantage will be continued as long as the insured remains a member of the association in New York City. If he should sever his connection, he would have to pay full rates. These facts should be of interest to the directors of the Y. M. C. A. in other places.

Notes

The largest insurance company in the world engaged exclusively in the fire insurance business—the Home Insurance Company of New York—is preparing to equip itself with one of the largest capitals. At the regular monthly meeting of the directors, held last week, it was voted to increase the capital from $3,000,000 to $6,000,000, using $3,000,000 of the net surplus for that purpose. The proposal has been approved by the New York Insurance Department, and will become effective on July 8. On December 31, last, the Home's net surplus was $14,351,755, inclusive of a conflagration fund of $1,800,000, voluntarily maintained at a liability. The company's capital has been $3,000,000 since 1875.

Contending that the fire insurance companies have wilfully suspended business in defiance of the laws of Missouri and that in doing so their act "constitutes a wilful non-feasance and non-user of the franchise and rights granted them by the state," Insurance Superintendent Revelle has cited all of them to show cause on July 1 why their licenses should not be revoked. The Attorney General now has a suit pending before the Supreme Court seeking to compel the companies to resume business in the state.

The Law Union and Crown Insurance Company of London, organized in 1806, has been doing some advertising in the commercial prints requesting applications for appointment to its United States managership, in succession to A. F. Shaw, of Chicago, resigned. It would be difficult to determine the number of those who sent in bids, but it must be large, for the position is an important one and the emoluments respectable. The plum has fallen to Messrs. Hall & Henshaw, the company's managers in the metropolitan district, and they will assume full jurisdiction over the American operations of the company on July 1. The home office assets are nearly $47,000,000; United States assets, about $900,000.

Hugo Schumann, president of the Germania Fire Insurance Company since 1891, died at his home in Brooklyn on June 12. He was born in Leipsic, Germany, in 1842; arrived in the United States in 1860; served in the Union army during the Civil War, and entered the service of the Germania Fire as a clerk in 1863. His promotions included service as cashier, secretary and vice-president, assuming the last-mentioned office in 1883. In addition to his connections with the Germania Fire, he was a director of the Germania Life Insurance Company, a trustee of the United States branch of the Rossia Insurance Company of St. Petersburg, and prominent in the various German clubs and associations. As a fire underwriter, Mr. Schumann was greatly respected by his associates for his ability and conservatism.

FINANCE & TRADE

Depression and Recovery

In the market for securities, last week, there was a swift change from sharp depression to almost buoyant recovery. On Monday, prices declined, mainly because of European liquidation. After the close of business, the Supreme Court's decision in the Minnesota rate cases was announced. On Tuesday morning, the price of American shares fell in London, and, later, in the New York market there was a violent break. The decision had been a disappointing one. While it was not clearly understood, it was generally regarded as hostile to railroad interests. On the same day there was marked depression on the London and Berlin Exchanges, due partly to the Balkan situation and to indications of the failure of the new German Imperial and Prussian loans of $56,000,000. By the end of the week it was known that subscriptions for these loans were not more than 50 per cent. In New York, on Wednesday, the depression continued. Steel common shares sold below 50 for the first time in four years.

The change came on Thursday, when there was a vigorous recovery of from 2 to 6 points. On Friday and Saturday the upward movement was not checked, and at the close there were gains, for the week, in a majority of the issues. Closing prices showed advances from the lowest level that ranged from 4 to 10 points. The losses of Northern Pacific and Great Northern, companies directly affected by the court's decision, were not fully recovered. But the course of the market may be indicated by the prices of Reading, Union Pacific, and Steel. In their shares 42 per cent of the business had been done. Reading's gain was 1¼, and Union Pacific's 2½, while Steel had a net loss of ¼. Union Pacific, closing at 147, had sold at 137¾. The week's business was 3,490,870 shares, against 2,888,630 in the week immediately preceding.

The sudden recovery was due partly to provision for a settlement of the Balkan quarrel, but mainly to the announcement, Wednesday evening, by the Secretary of the Treasury, that he was ready to issue emergency currency, upon the application of national banks or currency associations, up to the legal limit of $500,000,000. Notes representing that amount have been printed and are in the Treasury vaults. The greatest of the New York banks loaned several millions at 2¼ per cent. Its rate had been 3 per cent. And on Saturday there was a good statement of the condition of the banks of New York. There had been no application for the emergency currency which may be issued under the Aldrich-Vreeland act, and more currency was not needed. But the announcement (which, the Secretary afterward said, related to a possible stringency next autumn, and not to present conditions) had a reassuring effect. It convinced many that the Government realized what the situation was, and was inclined to give aid. Confidence was restored, and a large short interest in the market was hastily covered. The rise does not indicate any change in worldwide financial conditions, which are due mainly to great demands upon capital for public uses, the destruction of capital by war, and the hoarding in Europe.

Crop Report for June

The Government's June crop report is a little less favorable, with respect to winter wheat, than that of May. Condition has declined from 91.9 to 83.5, but is still above the ten years' average. The estimate is reduced from 513,000,000 to 492,000,000 bushels. Only 399,919,000 were harvested last year. Spring wheat is in good condition, and a crop of 252,000,000 bushels is promised. Last year's, which made a high record, was 330,00,000. There is now a promise of 744,000,000 bushels in all, or 14,000,000 more than the yield in 1912. Last year there were 1,418,337,000 bushels of oats, an unprecedented crop. The condition of the plants now is 87.2, against 91.1 a year ago, and a yield of 1,104,000,000 is indicated. But the June estimate last year was only 1,109,000,000, to which more than 300,000,000 were afterward added.

With a slight decrease of acreage, and condition percentage a little below the average, 177,000,000 bushels of barley are promised, against last year's record crop of 223,824,000. Hay and pasturage percentages are near the average for ten years. The rye crop will probably exceed last year's. In Canada, May was so cold and dry that growth was retarded. Acreage increases there are 58,000 for wheat, and 391,000 for oats.

The Independent
A Weekly Magazine
Founded in 1848
June 26, 1913
VOLUME 74 NUMBER 3369

To Our Readers

We take pleasure in announcing that Mr. William B. Howland, recently vice-president and publisher of *The Outlook*, has purchased a large interest in THE INDEPENDENT and this week becomes its managing director. Mr. Howland, while retaining his considerable share in the ownership of *The Outlook*, has severed his official connection with it after twenty-three years of service. He has taken this step for the purpose of developing certain publishing plans which he has had in mind for some time and which he now proposes to undertake in connection with THE INDEPENDENT. Mr. Howland's personal office will be in the new Publishers Building, at 119 West Fortieth street. The office of THE INDEPENDENT will soon be removed from 130 Fulton street, where the magazine has been published for many years, to the Publishers Building.

Mr. Harold J. Howland has resigned from the editorial staff of *The Outlook* to become vice-president and director of The Independent Weekly, Inc. He will soon become associate editor of THE INDEPENDENT.

Mr. Hamilton Holt remains president of The Independent Weekly, Inc., and Mr. Frederic E. Dickinson, secretary and treasurer.

The New Currency Bill

We have thought that a plan for the improvement of the national currency and banking system should be taken up during the present session of Congress, and we have hoped that a thoroly good plan would be proposed by the leaders of the party that controls legislation. Reform in this field is greatly needed. For two months to come the House will be comparatively idle, unless it shall be required to consider a comprehensive currency bill. Enactment of such a bill before adjournment cannot be expected. Even if it should be passed in the House, the Senate, wearied by its long debate on the tariff, would decline to add another debate on the currency. But it seemed to us that a beginning should be made in the House. Thus the subject would be brought before the country, and public discussion of the pending bill would be promoted.

A bill has been prepared by the chairmen of the banking committees, with the aid of Secretary McAdoo and the advice of President Wilson. It is a long one, with many provisions which will be regarded as highly technical by the average man who is not familiar with banking practice or currency principles. We shall speak now of the most prominent of them. It is proposed that there shall be twelve regional Federal reserve banks or banking associations. National banks must be members of these; state banks and trust companies may be admitted. These reserve institutions are suggested by the existing clearing house associations. The establishment of them under proper regulation and control is to be commended. It is in the direction of a wise decentralization, but these associations, under the provisions of the bill, are parts of a highly centralized organization. In fact, there is more centralization in the pending project than was proposed in the so-called Aldrich bill of the Monetary Commission.

It is in this centralization, in the character of the controlling central authority, and in the extraordinary powers granted to the controlling officers that the most serious faults of the bill are seen. The district associations, or reserve banks, and practically the entire banking business of the country, are to be controlled by a Federal board of seven men—the Secretary of the Treasury, the Secretary of Agriculture, the Comptroller of the Currency, and four appointed by the President. The salary of each of the four is to be $10,000, and it is required that "at least" one of them shall be a man of banking experience. One is to be the governor of the board, one the vice-governor, and another the secretary.

It will be seen that all of the seven would be appointees of the President. They would control the direction boards of the twelve district associations, or reserve banks. Each of these boards is to have nine members. The Federal board is to appoint three, and is to have power to remove any one of three more, who are to be elected as representatives of business interests, but are not to be connected with banking.

We have said that the powers to be exercised by the Central Federal Board are extraordinary. It is to be authorized to establish by weekly orders the discount rate for all of the district associations or reserve banks; to suspend reserve requirements for thirty days; to compel one district association to rediscount the paper of any other; to control and regulate the issue of treasury notes; to remove officers of a district association for fraud, incompetency or other causes which are enumerated; to examine the district associations' accounts; to require the writing off of doubtful assets; to order bankruptcies and appoint receivers, and to do other things.

Too much power is given to this central board and the board would not be properly constituted. In a certain sense its authority would be political. The one lone banker would not have much weight. One of the objects of the bill, its authors say, is to promote elasticity of the currency. But there is no provision for the rejection or modification of the currency which now rests upon bond security. The central board is empowered to add $500,000,000, but this appears to have been suggested by the existing law (the Aldrich-Vreeland act), which provides for such an issue of emergency notes, and there is to be no definite tax restraint. The tax is left to the discretion of the central board. That part of the bill which permits national banks to establish branches in foreign countries is to be commended.

We are not saying that the National Government should not be represented and should not exercise authority in any project for banking reform. But there is peril in the creation of such a central board as the one for which this bill provides, with the powers that are assigned to it. The central authority should supervise, but not dominate with respect to all the details of banking. And in a board of seven empowered to determine weekly the discount rate for the whole country there should be more than one banker. The banker members, moreover, should be men whose services are worth more than $10,000 a year. Discount rates should be left to the district associations.

Some plan ought to be submitted to Congress at this session. The one which has been prepared is defective, but consideration of it will tend to excite public discussion, to disclose its faults and to suggest amendment.

An Arc Light for Diogenes

Descriptions of the "Imperator" throw a vivid light upon certain familiar contentions, assumptions and prognostications touching American life.

They illuminate the contention of that school of social economists of which Mr. William Hurrell Mallock is the incomparable Nestor. We must have vast disparities of fortune, say the Mallockites, in order to have adequate accumulations of capital to carry on the enterprises of civilization. It is the rich men that know the value of a dollar, according to these thinkers, and do not incontinently let it slip thru their fingers for foolish expenditures. The light-minded proletariat takes no thought for the morrow. If wages were increased at the expense of profits, where would our savings come

from? Where then could we find the wherewithal to tear down our mills and build greater? Yet, it seems, the money-making owners of ocean steamships find it worth while to provide them with suites for any one of which the exclusive traveler must pay five thousand dollars for one short voyage.

Nothing less than resplendent is the light that the luxury of the "Imperator" throws upon that matchless product of the American intellect which the President and Congress of the United States are now trying to revise. We have been taught that if the consumer were not adequately taxed to maintain our puling infant industries, nobody could make profits enough out of the exploitation of our natural resources to keep up a population adequate to promulgate the Monroe Doctrine and interpret the Constitution. Yet of the opulent gentlemen whose names are associated with the Roman baths, the palm gardens and conservatories and the five-thousand-dollar suites of the "Imperator," not one is a European employer of the pauper labor of that effete continent. All are Americans —wage-paying, manufacturing Americans—and none is an honorary member of the Cobden Club.

Clear as noonday in the blaze of the "Imperator's" luxury, stands forth another noble theorem of American political ethics. Here is the land of opportunity, the asylum of the opprest. Who now can doubt it! The "Imperator" offers you opportunity, if you have the price, and the opprest who haven't got it will stay safely in their asylum while you are gone.

And our religion, our religion of simple Christian faith and love of fellowman, which Pilgrim and Puritan brought to these shores when they could no longer endure the pomp and worldliness of a state establishment of worship! Hath not their worship bourgeoned? And is not the promise fulfilled: they sought first the kingdom of heaven and the "Imperator" is added unto their children.

As a craft to cross the ocean in the "Imperator" may or may not be all that is claimed for her, but as an arc light for Diogenes her luxury is all that could be desired.

California's Defense

With pleasure we print this week the defense by Mayor Phelan, of San Francisco, of the legislation by California which forbids Japanese and Chinese to become owners of agricultural land, and which is intended specially to limit Japanese immigration. Our pleasure is not diminished by the evidence of the weakness of the strongest possible defense.

Two arguments are presented in various forms and phases why Japanese should be excluded as the Chinese are excluded. The first is that the Japanese are an unassimilable people, and as such are not wanted. How does Mayor Phelan know they are unassimilable? He knows this, that we have forbidden them to assimilate, that when they ask to be made citizens we reject them. Why they can't assimilate is because we will not let them. Our saying they can't assimiliate is pure prejudice. We used to say that Irish could not assimilate and states were controlled on this know-nothing platform. We know better now—it was race prejudice. We have heard *ad nauseam* the same of "Sheenies" and "Dagoes," Jews, Italians and Mexicans, but we are getting over that and now Mayor Phelan accepts them, while Russia and Rumania still declare the Hebrew race unassimilable and then forbid them to assimilate.

What assimilates a foreign people is education in the public schools and in the English language, and the experience of our better civilization. Dr. Sun learned all this in Hawaii and was assimilated, and then gave American institutions to China. How much has Japan become assimilated to the United States under the influence of American teachers and examples! Hawaii is a melting pot proving assimilation possible. There is no evidence that children of Japanese parents may not be as good American citizens and patriots as those of Anglo-Saxon parentage, altho the Mayor does not want it so and insists that Japanese shall be forced to remain "loyal to their own home government," allowed "no duties either to society or the state," forbidden to prove themselves assimilable. We who have proved that negroes

and Indians can assimilate, who knew that a man's a man for all his color, disagree from the Californian notion.

The other objection to the admission of the Japanese is that they are too thrifty; that they work too long hours and too many days, and live too economically. This is the real, serious objection. Granted; but have not the Californian people the matter in their own hands? If they want Sunday and the holidays to be rest days they make the laws and they enforce them, or fail to enforce them. If the Japanese work "fourteen or sixteen" hours a day as "human machines" California can have laws that forbid contracts requiring more than ten, or eight, or six hours' work a day. If a man chooses to work for himself, in his own house or field, sixteen hours or twenty, he should be allowed to, and nature will take care of that. We have not heard that the Japanese underbid in the labor market, and we are told that they demand the highest wages. If, then, they are saving after Benjamin Franklin's rule, that is to their credit, and their gardens and their art are proof that they know how to enjoy wealth, as well as how to work and save.

It is all simply race prejudice. Says Mayor Phelan: "Where two races are endeavoring to live side by side; one must take the inferior place." We see no reason for that. It is people, rather than races, that are superior or inferior. Some people gravitate down, while others rise by energy and thrift. Mayor Phelan and the Californian politicians have an attack of the shivers. He says it is "a question of preserving California as a white man's country, upholding American standards and civilization, or abandoning it to our alien people, capable, in this fierce competition, of either exterminating the whites or reducing them to a hopeless lower economic, social and political plane." Nonsense! We have no idea that our white Californians are so inferior. Those Portuguese the mayor tells of are not yet being exterminated, despite their happy Sunday rest. Even if there are 55,100 Japanese in California that is only 1 in 45 of the population, not a great task in either control or assimilation, not enough to keep the statesmen awake nights, particularly as the Japanese are decreasing in numbers. The danger is not worth risking "amicable relations with a foreign government."

The complaint comes from the source that does not like to see other people successful. The success of one is the success of all. If the Japanese have irrigated land for potatoes, with intensive culture in the Vaca Valley, or have succeeded in fisheries in British Columbia, that is fine. There is plenty of land yet in California and the sea is wide.

Emperor William's Great Act

Believer as he is in the divine right of kings, it will be remembered to the everlasting honor of the Emperor William II of Germany, that he yet believed in the divine right of kings limited by the constitutional will of the people.

It is a most remarkable story which Professor Hintze revealed on the occasion of the Emperor's silver jubilee. His great-uncle Frederick William IV, who had been obliged to flee in the revolution of 1848, was compelled to give Prussia a constitution, but he never gave it his hearty consent, and he left his secret political will, to be shown to his successors on ascending the throne, directing them to withdraw the right and to reign purely autocratically. The Emperor Frederick when the solemn document was shown him simply declined to obey the injunction; but the present King of Prussia and Emperor of Germany, when it was shown him, fearing some hothead of a successor might attempt to obey it, destroyed it, and himself wrote on the envelop that this had been done by his will.

This is one of the most remarkable incidents of political history that have been enacted for many a year, and is immeasurably to the credit and honor of the Emperor William. Concealed for a quarter of a century it indicates the solidity of his judgment even in his youth. It adds much to the sense of his greatness, and it marks the conquest of the will of the people over that of the monarch uncontrolled and absolute. It is scarce half a century since that political will was left to Frederick William's successors, and now the bequest he left for them to carry out is politically so im-

possible of accomplishment as to seem absurd. The lesson of 1848 has been well learned. Not Germany alone knows it, but Japan has a constitution under which the people rule, and even China asserts hers without an emperor to flout or deny it. The world is living in a better era than that which beclouded Europe before 1848.

The Borrowed Petticoats of the Suffragets

Now that Premier Asquith and his party have weathered the storm raised by the blunder of two of the Ministry in their speculation in American Marconis, we may say with confidence that Irish home rule will be achieved within a year. It has been a second time adopted by the House of Commons, and the third time will enact it despite the Lords.

Then arises the question, What will Ulster do? To be sure, a majority of the members in Parliament from the Province of Ulster are Nationalists, but County Antrim and the city of Belfast are against home rule, and they say they will never submit to it. They will fight, as do the English suffragets. They are importing muskets for war. They talk very big. But what will they really do? Have they the persistent, daring senselessness of their English sisters? They appear to be of a feather, but we cannot but suspect theirs will prove a white feather.

What would happen if Ulster, or a part of Ulster, refused to accept home rule and to obey the authorities in Dublin? It is a question which has amused the Irish people. We presume that the British Government would be in no hurry to send an army to suppress a rebellion. The Orangemen might march and countermarch for a good while in helmet and cockade, and it would be treated as holiday antics. Officials would be appointed, and they would be in good measure Protestants, Presbyterians, and those who accepted would be called traitors and turncoats, but they would have their following. But there are other disintegrating forces that would preclude the need of any military measures.

Let us suppose Lord Londonderry and his Council of Five to have set up an independent, anti-nationalist rump government, and this without any resistance, all waiting to see what it will do. Then suppose Captain Craig's establishment at Distillery street wished to ship 100,000 gallons of "Craigavon Three Crown" to the trade in London, would it not have to submit to King George's tax collector? Or suppose some subject of that "Provisional Government" we hear of wished to complete the purchase of his holding under the Land Purchase Act, or to execute a mortgage, or to transact any other business which would have to go thru an administrative office in Dublin, what could he do? Would he not feel tired? How would the banks maintain correspondence with banks outside of their little corner of Ireland? Indeed, how could business go on, with the Belfast Lough held for King George by a revenue cutter? Prosperous manufacturing agencies and successful banks would find their business utterly disorganized, and that without a gun fired to resist the rebels, while thousands of workmen living from hand to mouth would be thrown out of employment and compelled to reconsider.

Lord Londonderry and Sir Edward Carson and Mr. Bonar Law have much to be responsible for in their resort to the suffraget tactics of lawlessness, violence and rebellion.

A New Dogma

We find in Catholic journals credit given to a report from the Vatican that Pius X intends to make his reign as Pontiff illustrious by adding a new dogma to the faith of the Church. Leo added none in his pontificate, but Pius IX added two—that of the Immaculate Conception of the Virgin, that is, the doctrine that she was, like her Son, conceived without taint of original sin, and lived a sinless life; and the other that of the infallibility of the Pope. The new dogma, which it is said that Pius X will proclaim, is that of the Blessed Virgin's Assumption.

But what is the Assumption? Most know it chiefly from art, Murillo's figure of the Virgin rising in the clouds, with her foot on a crescent, and surrounded by angels. They know it must mean her

being taken up to Heaven, but when or how? The general idea is correct, and there is no such general misapprehension as in the case of the Immaculate Conception, which Protestants often take to mean that she was, like our Lord, born from a virgin.

The Bible and early Christian writers have nothing to say of the Assumption. It first appears in a book of the third or fourth century, entitled "Concerning the Passing of Mary," which embodies Gnostic traditions and was condemned as heretical by Pope Gelasius. According to the story, she lived in Bethlehem for twenty-one years after the death of our Lord. Here an angel told her that her soul must be taken from her body, and she was wafted on a cloud to Jerusalem. The apostles, who had been miraculously gathered, carried her to Gethsemane, and there her soul was taken to Heaven by Gabriel, while the apostles conveyed her body to a new tomb in the Valley of Jehosaphat. But here her Son Christ appeared, raised up her body that it should not see corruption, reunited with it her soul, which had been brought back by Michael, and angels bore her up to Heaven. This is the Assumption of the Virgin.

But this was a Gnostic fable, condemned with other fables A. D. 474. The Nestorian controversies later gave great currency to the adoration of Mary as the "Mother of God," and to stories which gave her honor. A number of writings appeared in the seventh century, pious forgeries, attributed to early Fathers, such as Athanasius and Jerome, and even this Gnostic "Passing of Mary" was attributed to the Apostle John. The first who taught the Assumption as a belief of the Church was Gregory of Tours, A. D. 590, and by degrees it came to be a Catholic tradition.

This is the story, the substance or kernel of which it is reported Pius X will make a dogma of the Church. We sincerely hope he will not do this. To believe this is not necessary for salvation, and it would be an additional burden on the Church to carry. It is bad enough for it to have to carry the dogmas of the Immaculate Conception and Infallibility, without adding to them. And this we say out of good will to the Catholic Church. We believe it will hold more faith as it requires less credulity. The Church was never in better condition than in the days before credenda were imposed, and every addition is a subtraction of living faith. Faith in God does not grow best under fetters. Submission to authority is not faith. Nor is the suppression of reason faith. To believe a dogma because required to is to enslave reason, the best gift of God, which separates us from brutes and allies us to our Maker.

Presbyterian Bonds

The recent resignation of Dr. John M. Macklin, as Professor of Mental and Moral Philosophy in Lafayette College, at the demand of President Warfield, raises again a question as to liberty in the Presbyterian Church which we hoped had been settled.

Lafayette College has in the past had official relations with the Presbyterian Church. The Presbyterian Church allows various types of theology, as represented in the conservatism of Princeton Seminary, where Prof. B. B. Warfield, brother of President E. D. Warfield, has long been the champion of the conservative faith to be found in the Westminster Confession; and the more liberal and modern theology of Union Seminary, such as is allowed by the shorter Presbyterian creed adopted a few years ago. President Warfield would hold Lafayette College to the Princeton type of theology, and because Professor Macklin's teaching does not agree with it, has required his resignation. We cannot blame the president, for he conscientiously believes this to be the only true type, and that the type which allows higher criticism denies both Christianity and Presbyterianism.

But there are Presbyterians in plenty who think otherwise, and the students, whose judgment may not be worth much, are indignant, and have the impertinence to ask the trustees to remove the president. President Warfield is a fine scholar and a polished gentleman, and has had a long and honorable career at Lafayette, while Professor Macklin is a younger man and represents the present and the future.

It would appear that a college ought to

allow quite as much liberty of thought as does a religious denomination. The Presbyterian denomination is broad and broadening. It can retain as ministers in its Church Professor Warfield of Princeton Seminary, and President Brown of Union Seminary. It can ordain graduates of both seminaries, equally loyal, equally Christian, because it can be hospitable to either style of theology. It seems very strange if Presbyterian bonds which do not bind the Presbyterian Church should be evoked out of antiquity to bind nowadays a college more or less Presbyterian.

When the World's at the River

Do you know it—the rumble of the observation train, keeping jerky pace with the rhythmic sweep of the shells down the river? Do you know the flash of the sun from the oars? Do you know the hush of the moment when the thousands on the shore and the tense crews together wait the start? Or the sudden pandemonium when a shell slides past the finish buoy?

Better, do you know the lithe motion of the slender craft, in which—saving the ducking you will get sooner or later—the smooth coördination of oars and rigging and seat makes even the canoe seem awkward?

If you do, it was a great week for you—or a keenly disappointing one—into which both the pleasant regatta at New London and the nation-wide meeting at Poughkeepsie, where championships are won, were crowded.

The whole month, indeed, has been a rare one for sport-lovers whose interest lies beyond the commercialized hysteria of the diamond. From the Antipodes they came to play tennis with us; from his Majesty's Service they came for polo; our rivalries—and the friendships they bring—have been world-wide. And nowhere but, perhaps, in the intercollegiate track meet is all the United States so splendidly represented in sport as on the Hudson and the Thames. Where Washington and Wisconsin meet the great rowing universities of the East, with only the old New England rivals absent, there one realizes how great a force for homogeneity and good fellowship we owe the "boat clubs" of the forties and fifties which began college rowing on this side of the Atlantic. And pity the university which does not share the tradition!

At the University of Minnesota, it is said, this finest of college sports will become possible when a Mississippi dam is completed. Future race-days may see another Western crew a regular contestant on the broad Hudson, where Wisconsin has been so welcome a visitor.

But this is a year for repelling invaders. Britons and Australians met defeat, and here the Washington crew, which came to the Hudson with a Pacific championship, placed third, behind Eastern veterans of the course. Splendid races, both Freshman and 'Varsity—races in which there was fight at every stage!

In a six-crew race nothing is certain. Cornell and Columbia, rivals on the water for many years, led brilliantly down the course, contesting every inch for three miles; then an eight which had husbanded its unexpected strength snatched the race from both for Syracuse.

At New London the result was not unlooked for. Only the Freshmen from New Haven were dangerous. The fate of Yale's plucky campaign to rebuild her entire rowing system on Oxford models is still uncertain.

But for the watchers it was a week to remember.

An Archdeacon on Mt. McKinley

It is lucky that an archdeacon did it. Nobody else would have been believed. There have been too many claimants for the honor of reaching the top of our topmost peak and too many disputants of their claims. Dr. Cook's "ascent of Mt. McKinley" was his first step on the downward path. Finding how easy it was to fool the American people, he was encouraged to try to palm off the North Pole on them and seemed likely to succeed except for the return of Peary in the nick of time.

As the question stands now the north peak of Mt. McKinley bears the flag pole erected on it by Thomas Lloyd, and the south peak the cross erected on it by the Rev. Dr. Hudson Stuck. According to the latter, his peak is the higher and doubtless this will be accepted, not because it is the word of a priest against

a layman, but because he had better instruments for determining the altitude. He makes it 20,500 feet, or 200 feet higher than it had been previously estimated by observations from below. Dr. Stuck has for nearly ten years been engaged in the missionary work of the Episcopalian Church in Alaska. He was graduated from King's College, London, in 1883, and is, it is unnecessary to add, a high churchman.

A Summer Disease

The presence of warm weather properly calls attention to infantile paralysis, which is a summer disease. It used to be considered a rather infrequent disease, but has of late been epidemic in various parts of the country, and medical attention was concentrated last year on the effort to learn everything possible about the disease and, above all, its cause and mode of distribution. The affection, which in scientific language is known as acute anterior poliomyelitis, is characterized by the development of characteristic paralyses in children due to degeneration and rapid destruction of the large ganglion cells of the anterior horns of the spinal cord. The paralyses produced may be of a single group of muscles, or may affect all the muscles of one or of several limbs, or even of all four limbs and of portions of the trunk. The affection may be fatal in a comparatively short time. Its favorite victims are children, and they may recover, but they may be sadly crippled for life. Probably no disease in recent years has produced more sadness in families than this.

It is extremely interesting to realize then that the mode of dissemination of the disease has been found, one of its carriers at least is recognized, and that therefore it may be better guarded against than in the past and eventually entirely eliminated. The carrier thus far discovered is the stable fly, the *stomoxys calcitrans*, which lives on the blood of animals and particularly dwells near stables, but which occasionally invades human dwellings and bites particularly children who are not able to protect themselves against it. This seems to be the reason why infantile paralysis only rarely attacks larger children or adults.

All the investigations by which this important series of facts was discovered were made in the laboratory of the Bussey Institution of the Harvard Medical School. The first sure connection ever traced of the distribution of disease by insects came from Prof. Theobald Smith, of Harvard Medical School, who demonstrated that the so-called Texas fever among cattle is transmitted by ticks. No less an authority than Professor Koch proclaimed this discovery of Theobald Smith as an epoch-making advance in our knowledge of the distribution of disease. It was followed almost immediately by the discovery that malaria was transmitted by the mosquito, the sleeping sickness by the tsetse fly, yellow fever by the mosquito and plague by means of fleas. The result of this series of discoveries has been the greatest advance in the prevention of disease that man has ever made. Yellow fever was eliminated from Cuba, both malaria and yellow fever obliterated in the Canal Zone, bubonic plague brought under control, and evidently it is only a question of time until all insect-borne diseases will be a thing of the past.

The discovery that the stable fly was the carrier of infantile paralysis came about first thru a careful consideration of the time of the occurrence of the disease. It was only during the warmer months and especially during the late months of summer and the early months of autumn that the disease existed. Such limitation of the disease always indicates, as we know now, an insect carrier. Other insects as fleas and bedbugs were ruled out because many cases of infantile paralysis occurred in households where these insects do not exist and, besides, the occurrence of many scattered cases of the disease was out of harmony with the habits of these insects. After going down the list of the biting, blood-sucking insects only the stable fly was left and a series of experiments were undertaken by which its actual role in the disease could be discovered.

For some time it has been known that the monkey is subject to infantile paralysis, and Professor Rosenau, of the Harvard Medical School, took up the problem of determining by means of this animal the relation of the fly to the dis-

tribution of the disease. Monkeys were infected with the disease by injection and then allowed to be bitten by stable flies. After an interval these flies were allowed to bite other monkeys. Bitten monkeys exhibited the symptoms of the disease in six cases out of twelve. Control observations were then suggested and at the request of Professor Rosenau were made by the United States Public Health and Marine Hospital Service at Washington. Two careful, trained observers Drs. Anderson and Frost of the government service repeated the experiments and proved that the disease developed in monkeys infected by infected stable flies was infantile paralysis. The evidence that the fly carries the virus was then complete.

The stable fly resembles the ordinary house fly in many ways and is indeed closely related to it, but differs from it in a number of important respects. The adult stable fly feeds exclusively on blood, biting particularly the domestic animals so that the flies are much more common in the country and are often seen in the neighborhood of stables and barns in cities or towns. It does not often enter human dwellings, but prefers to stay out of doors in good weather, but it seeks shelter during storms. It is because of this that there is a proverb that flies bite before and during a rainstorm. The ordinary house fly does not bite, but this stable fly does and it is during rain that it is found in the house.

The control of the stable fly will probably prove quite as difficult as that of the house fly, tho with proper care it is probable that its occurrence can be greatly limited. Until all stables are removed out of towns and the horseless age has come, it will probably be impossible to exclude them entirely from cities and towns. The flies begin to develop early in the spring, and they become much more abundant after midsummer. They are more hardy than the house fly and persist later in the season. Ordinary fly-traps and sticky fly-papers will probably not prove efficacious against them because, as a rule, they live only on the blood of warm-blooded animals. They develop mainly in manure, but much can be done to prevent this development by proper treatment of the manure piles and it is probable that the occurrence of the fly can thus be greatly limited.

Nothing illustrates better than such discoveries, how much of good for mankind thru the prevention of disease may be secured by the proper maintenance of medical institutions in which original research is carried on and opportunities for scientific investigation provided. Hardly a greater field for philanthropy is now lying open.

In Brief

The journals of the British denominations are very reasonably concerned over the progressive falling off of their membership since 1907. In that year the Baptists reported 434,741 members; in 1913, 416,377; the Congregational membership fell in the same period from 498,916 to 490,722; the Primitive Methodists from 211,673 to 210,677; and the Wesleyan Methodists from 568,344 to 540,251. There is a similar falling off in attendance in the Sunday schools—the Baptists from 590,321 to 570,906; the Congregationalists from 738,210 to 692,676; the Primitive Methodists from 470,095 to 467,516; as the Wesleyan Methodists from 1,026,940 to 989,578. Possibly the falling birth rate has something to do with this, but we think more the emigration to Canada.

This is what Dr. Charles E. Jefferson, of the Broadway Tabernacle, says, on his return from a visit to the leading countries of Europe, of the military and naval trusts that are exploiting and oppressing all the nations: "I am persuaded that the militaristic hierarchy is the most treacherous and despotic enemy that has lorded it over the nations since the power of Rome was shattered, and that unless the Christian church puts on the whole armor of God and goes out united to make war upon this Goliath that struts in armor plate and boasts of bayonets and lyddite shells, it renounces the mission to which it has been called, and surrenders its position as Christ's anointed leader and Savior of mankind."

In the late investigations of moral conditions the cities have been held before the nation as the breeders and fosterers of vice. But in an address to the graduates of the College of the City of New York Mr. Abram I. Elkus, a Regent of the University of the State of New York, defended the cities as presenting the very best as well as the worst place of life. We may not for-

get the sad facts thus presented by him: "When these critics speak of the crimes committed in New York City by the ignorant and the foreigners, it is well to remember that perhaps the greatest crime of this decade committed against the electoral franchise was committed in Bucks County, Ohio, by 2000 native-born American citizens, who boasted of their native American ancestry; and when the ignorance of the great East Side is alluded to, as is so often done, it is well to remember that the most illiterate school district in the whole United States is the one where the percentage of the foreign born is among the lowest."

Every Southern state has a law requiring negroes to ride in a separate railway car, but also requiring that the service for the negroes be equal to that for white patrons. But this equal provision is never made. Correspondence received at this office makes bitter complaint of the inferior cars and service. Where other cars are steel, theirs are wood, and crumpled up in case of accident and passengers killed. Where the cars for the favored race have separate closets for the sexes, the negro cars have but one. They ask that at least a portion of the dining room be set off for them. The required equal service is not given, because it will not pay. Then repeal an invidious and odious law.

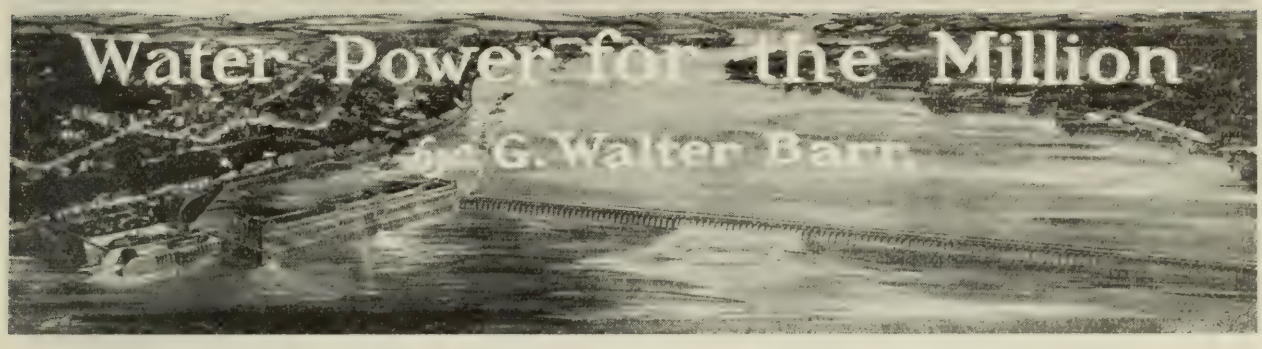
The one language which it is most important for political reasons to learn is the Spanish, and yet very few learn Spanish. The Bureau of Education at Washington has been raking the country for teachers who can take positions of importance, in our Spanish-speaking possessions, with salaries up to $2400 and cannot find them. The American Minister to Panama applied for professors of industrial arts, agriculture and veterinary medicine, but the response from various institutions was, "None of our industrial art experts know Spanish." Here is an open field for teachers in all Latin America.

The Orangemen of Belfast have a great fear of Roman Catholic intolerance when home rule is given. It is an interesting commentary on this complaint to consider the distribution of offices in the city of Belfast. The Board of Guardians pay $84,000 in salaries, of which Catholics get $3400. The Harbor Board pays $56,345; and the one Catholic official gets $1250. The Water Board has on its payroll one Catholic, whose wages are $325, out of a total of $29,000. Of the twenty-five medical officers not one is a Catholic. There are 100,000 Catholics in Belfast, more than a fourth of the population.

We burn negroes here in this country when they displease us, but we have heard of nothing quite so extraordinarily horrible as the story which comes from Russia of a strike in the beet sugar industry in which girls were brought to break the strike, and at night the mob barricaded the doors of the house in which they slept, refused to have mercy on their frantic shrieks, and burnt them to death. That is the Tartar blood we hear of.

We are glad to record the statement coming from Bishop Rhinelander, one of the Philadelphia Vice Commission, that there is no particle of truth in the widespread story that the postal authorities refused to allow the commission's report to pass thru the mails. It tells, as all these city reports do, a terrible story, but it contains nothing that people ought not to be told.

The contagiousness of mob madness appears in the fact that the crazy act of Miss Davison in killing herself trying to stop a horse in the Derby race, has been followed by the precisely similar act of a male suffragist at the Ascot races, who was fatally injured in stoping August Belmont's horse. Not by such defenders is the cause helped.



The fact that sixty-seven Chinese farmers were burnt to death lately by soldiers in their resistance to the attempt to destroy their opium crops is proof that there is a grim determination in the resolve to exterminate the production and use of opium in China.

Here is a new step in the way of national control of public utilities. A proposed bill for the construction of railroads in Alaska has had the approval of President Wilson and is likely to be enacted. The government will build them, as it dug the Panama Canal.

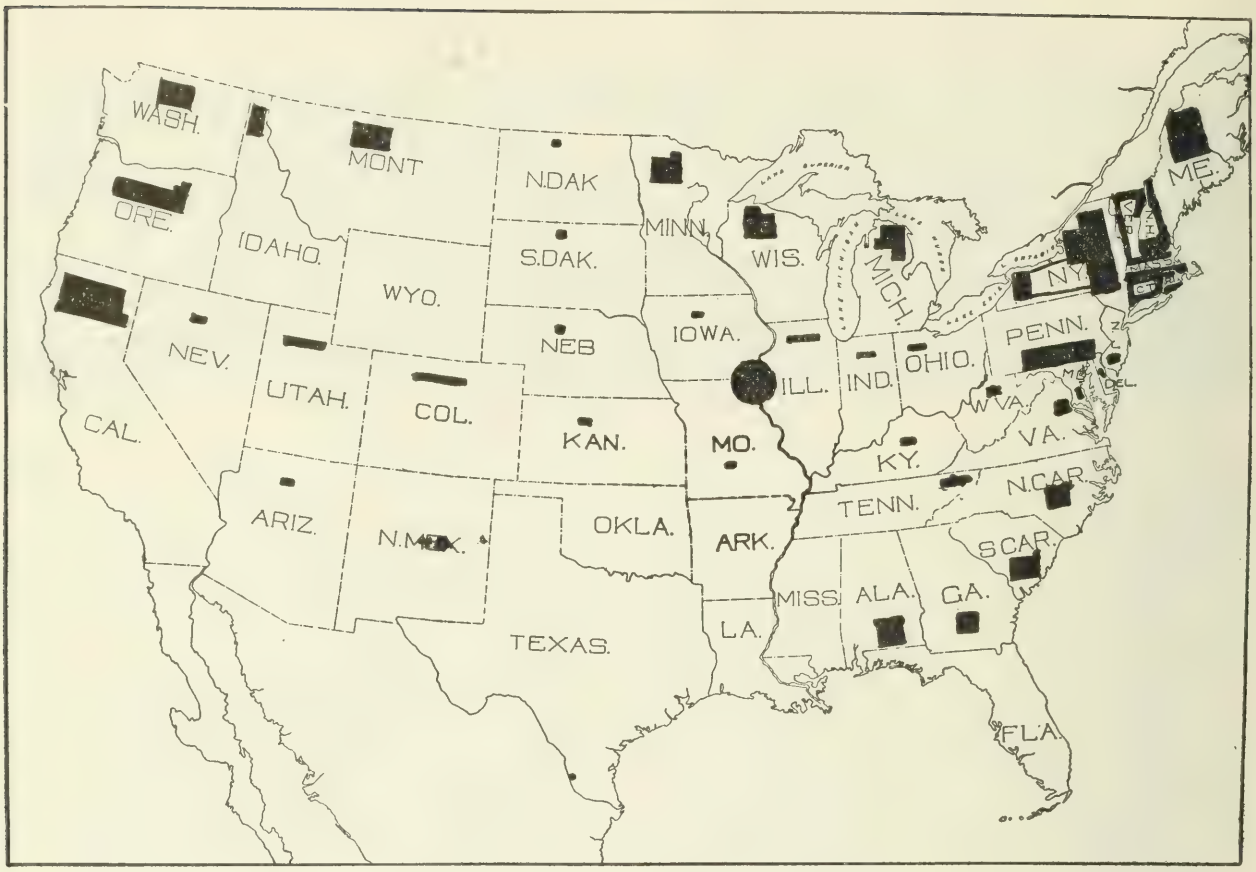
The Episcopal diocese of Washington declines to drop the name "Protestant" from the title of its church, and again it was a rector adventive from England who urged the change. So go the large Eastern dioceses, at least the laymen.

We may have to annex California after all if that state keeps on endangering the property of foreign residents. If we can't touch her under the Constitution, why not under the Monroe Doctrine?

The Mississippi was the Rubicon of the suffrage movement.

Water Power for the Million

by G. Walter Barr



The real significance of a great spectacle is apt to be lost in the amazement which follows the first glance at its magnificence. The really important factors in a great work are not usually seen in lists of dimension figures and geometrical blue prints, however impressive these may be. Leaving to others the miracles in masonry and their details, this is a calm and analytical consideration of the real meaning to the American people of the wonderful water-power development now practically completed in the Mississippi River at the junction of the states of Iowa, Illinois and Missouri.

The development of water power in the United States has been confined to the borderland of the nation in the past. The quantity of power produced by water wheels in the states not on our frontier is insignificant. The states along both oceans and those along the Canadian international line have more or less water power in use, but the others are almost as destitute of turbines as they are of shipyards. With water-power plants generally located among the mountains, the electric current generated must often be carried considerable distances, and even then is generally beyond the reach of factories depending on railroads to haul raw materials and finished products. The inevitable result is that the electricity from these mountain power houses is used chiefly for municipal public utilities, the running of street cars and interurban lines, and the lighting of houses and stores.

The electricity generated in the power house in the Mississippi, however, will be utilized chiefly for manufacturing—and incidentally it may be stated here that its quantity of water power is exceeded by the total water power in only three states. It is this use of the power of the Mississippi at its mightiest for factories that is the most important thing about the Keokuk installation of turbines and generators.

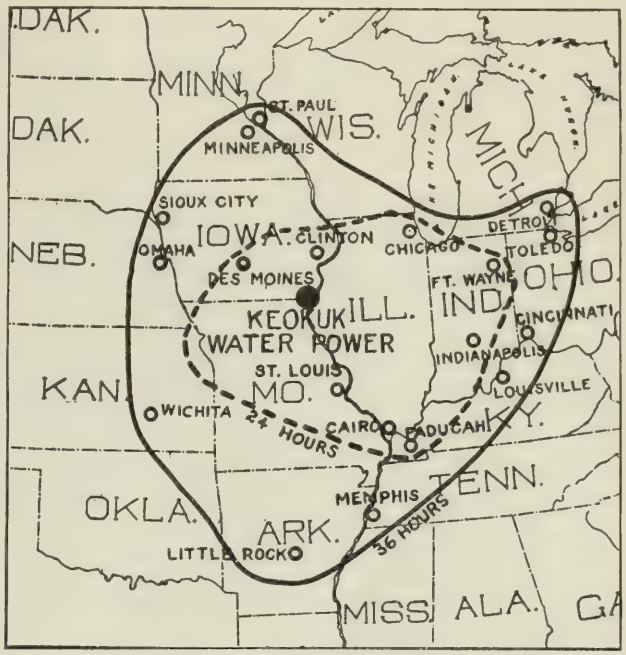
Experience carefully collated shows that each horse power developed by a water wheel supports five people; the factor of five is rather remarkably constant. If two-thirds of the shaft development of the Mississippi River wheels is used in manufacturing, it will furnish sustenance to a million persons—and this new sustenance is developed out of nothing but scenery as surely as would be the discovery of a method for making omelets out of marsh mud. Whatever one may think of the doctrines of Marx, the bringing into existence of perpetual sustenance for a million people, by creating the necessity for workers supporting that many persons, seems a sociological achievement of much moment. In this particular case, this new industrial primogenesis is located in the midst of the agricultural garden of America; the million will find the plowman and the husbandman their nearest neighbors and their daily bread growing in the adjoining field.

This proximity of farm products is of more importance than some economists realize. The commercial map of Europe, older than our own, shows that manufacturing has gradually and surely drifted to a habitat in the larger valleys, drawn there for food for the workers. America is just beginning this stage of evolution with the building of Gary, and the fact that the manufactured products of Iowa almost exactly equal the farm products of that superlatively agricultural state are evidences. This one Mis-

STATE WEALTH IN WATER POWER

The quantity of water power developed in each state is represented by rectilinear figures, all drawn to one scale. The quantity of water power developed in the one installation of turbines at the junction of Iowa, Missouri and Illinois is shown by the circle drawn to the same scale. It is exceeded in any one state only by New York, California and Maine. The development of water power hitherto has been around the edge of the nation, while the latest and largest development is in the center of the Mississippi Valley.

sissippi River water power harnesses horse power about three times that used in Iowa today and more than is used in manufacturing in the entire state of Missouri, with St. Louis and Kansas City and half a dozen other considerable manufacturing centers.



Cheapness is the only reason for the existence of water power economically, altho commercially it has other advantages, among them the ease of carrying electric energy, the use of individual motors at machines and increased safety for workmen. This Mississippi River water power in the form of electric current is sold at a fraction of the cost of steam power in the section which has the benefit of the cheapest coal in the world. It is compellingly cheaper than any steam power. Conversely, the cheapest coal in the world will control the rates charged for the power made from the Mississippi better than anything ever has been controlled by government.

Most people will agree that this dethroning of King Coal in his best intrenched stronghold is beneficent. It allows the black diamonds to be used for better things than besmirching industrial cities with smoke and soot. The colossus of power houses will do the work of about five million tons of coal every year, and in a few decades the total saving of coal by its water wheels will reach a large total. The quantity of coal burned to generate 1 horse power in a steam engine varies from 1 to 25 pounds per hour in actual practice, and the practical extremes are 6 and 25 pounds per hour. Adopting the mean of these figures as a factor, two-thirds of the horse power developed on the thirty turbine and generator shafts in the Keokuk power house, if generated by steam, would require 4,650,000 tons of coal per year. The steam engine puts on the shafting about 12 per cent of the energy stored in the coal; the water wheels in the Mississippi River at Keokuk transfer to their shafts 86 per cent of the energy in the falling water, and the electric generators send out over the

wires over 91 per cent of the power they receive from the shaft connecting them with the turbines.

This titanic water power dropped into the Mississippi almost over night produces circles of waves of force reaching to contact with too many indirect results to be even catalogued here. Of course, those surrounding farms, so important to the factory operative, will have a home market for their products enlarged by a million or so new consumers. The location of this new industrial force in the very center of the vast, teeming Mississippi valley, with five-twelfths the area and half the population of the continental United States, spells the shortest aggregate haul for both raw materials and factory products; this is shown in lessened freight cost; moreover, freight rates are actually controlled to a considerable and increasing extent by river transportation, which, of course, will always be available in that territory. Recognizing the relation between freight rates and successful manufacturing, there is a marked revival of the movement to provide the needed dock terminals at the cities in the new power zone. Eight million horse power has been harnessed by turbines in the state of New York since the Niagara power houses were built, but this reflex stimulus to the interior of Iowa, Illinois and Missouri from the Keokuk installation probably will not be so great, altho the giant in the Mississippi almost certainly will stimulate water-power activities thruout all three states.

Keokuk, Iowa.

THE AREA SUPPLIED WITH POWER

The immediate sphere of influence of the Mississippi River water power is indicated by the lines on the map. The outer, solid line is the distance which freight is hauled within thirty-six hours, arriving on the morning of the second day after being shipped from the site of the water power. The inner dotted line represents the same thing with a time limit of twenty-four hours. In actual practice there will be several different similar figures on the map, as the manufacturing from the colossus of power houses will be done at Burlington and Fort Madison, Iowa, Warsaw and Quincy, Illinois, and Hannibal and Saint Louis, Missouri, as well as at Keokuk and Hamilton, at opposite ends of the big dam.

Nicodemus

By Harry Kemp

And Nicodemus came by night
  When none might hear or see—
He came by night to shun men's sight,
  And away by night slunk he.

He dared not come by light of day
  To move where sinners trod:
He must hold apart from the common heart,
  For he was a man of God!

But the honest Christ, he walked with men
  Nor held his ways apart:
With publicans walked, with harlots talked,
  And loved them all in his heart. . . .

Came Nicodemus to Christ, by night,
  And long they reasoned, alone,
Till the old man saw the sham of the Law
  That turned his soul to a stone.

He tore the formal husks from his life,
  He was born again, tho gray,
And, erect with the youth of a living truth,
  He dared the world by day.

New York City.

Thru the Eyes of the Blind

By Walter E. Baker

[At cosmopolitan Columbia five blind students, four men and a woman, have taken baccalaureate degrees within the past four years. Mr. Baker, who was prepared for college at the New York Institute for the Blind, was graduated in 1912 with a standing well above the average. In this article he has told very frankly and simply, from his own actual experience, the little familiar things about the daily life of a blind person which, in our half-curious, half-blundering sympathy, we often fail to realize.—EDITOR.]

If you will accept my humble guidance and will enter upon an unknown world with the simple faith of an earnest seeker after truth, together we may discover a few things new to you. Let me warn you, however, that we are not to visit any picture galleries, nor are we even to look in at a pantomime. The world you are about to enter is a world of sounds, tactile sensations, and odors. And, too, there is the sense of the awareness of objects neither seen, nor heard, nor come directly in contact with. The sense of taste enters also in a way that most people do not dream of. And not once in all of this are you to look at a single thing.

We have just left my home, where we have detected my mother baking a cake. I loitered a moment to fill my pocket with matches as I passed the kitchen door. I heard the clatter of the eggbeater, the grating of sugar against the bowl, and the sifting of flour. These tell the tale.

We are now on the street; which way shall we go? Well, suppose we drift to the college grounds; there are more adventures to be met along that road than along any other with which I am familiar. We wait for a lull in the traffic before attempting to cross the avenue. But at last we are safe on the other side. Now it's clear sailing until we reach the next crossing; but I am speaking too fast. My cane strikes a low object. The iceman, whose cellar is at hand, is getting in a new supply. But there, on the other side, stands a large object. We are between Scylla and Charybdis, and the channel is none too wide. But now that danger is passed, and we have time to listen to the noises of the street. To you it is only a confused roar; but I hear the various component parts of the confusion. There is the grumble and roar of an automobile truck, the heavy grinding of car wheels, the loud clatter of horses' hoofs, the rumble of wagons, and the teamsters' shouting—each coming as a distinct sound accompanied by the others. Anon, comes the light beat of carriage horses' feet, followed in rapid succession by another similar sound, and another, and still more of them. Some fortunate creature is being carried to his final resting place.

But now we are to the crossing. Some fifteen yards from the corner I hear the chug-chug of an automobile. It is coming as fast as the law will allow it—a little faster, I fear. But what is this? He stops and cries out to me, "Go ahead, Billy." I cross. You say that this is a rare case; but it has happened at least a dozen times within the past year, and it has never been twice the same man. I am sure I should have remembered his voice had it been the same man.

Now, we are at the next crosswalk. It is a busy street. We had better wait until it quiets down a bit. Before it quiets, however, I shall wager that a passerby will volunteer assistance. Yes, here he is now. In a tone of command, one such as indicates precision but does not arouse indignation, he tells me to step down. At the other side of the street the command comes again—this time, to step up. I cannot help admiring the unusual precision of this man's orders. Most people tell you to step up as tho they believed that you wore seven-league boots, or else when you have stubbed your toe. Here is a real treasure. I suspect that this self-constituted guide is a military man; I comment upon his unusual precision. Well, I have chosen the right bait; I learn that he has been five years in the infantry and three years in the artillery.

Now he has left me with a good store of military yarn-spinning, and safe on the other side of the most dangerous street in our part of the town. I strike out boldly toward the next corner. In the

midst of the square I encounter somebody who seems to stand in my way purposely; I suppose that it is a man, for women do not act that way. I feel that it is not an inanimate object. I cannot say how I feel it, but I do. I am aware that he towers above me and is rather portly. I cannot say certainly who it is, but I hazard a guess. "How are you, old bluecoat?" I venture to ask. "I can't fool you, can I?" returns the policeman I have fallen in with many times of late. This has grown to be his favorite trick. He is going my way, and, as usual, he offers to walk a few blocks with me, since our paths are the same. He seems glad enough to have a companion, for he tells me how monotonous this most respectable of beats grows. I fear that there is a causal connection between his inactivity and his portliness. I do my best to relieve the monotony of his life by good talk, and when we have come to the end of his beat—some four or five blocks above where I met him—he still holds me in conversation for a few minutes. Of course, a good talk must be as carefully finished off as any other piece of art.

Now I am passing along the wooden fence which surrounds the lower end of the campus. Presently it is passed, and I feel that I am in immediate proximity to one of the stone buildings of the college. I cannot tell you how I know that it is a stone wall, only I feel that it is different from the wooden fence. It is that feeling of the awareness of the presence of objects neither seen, nor heard, nor come directly in contact with, which the psychologists call "the sixth sense." Now, by the aid of this sense, I feel the opening between the buildings, which means that here I am to enter. And, too, I feel the wind coming thru it, blowing fresh on my face. There is always a breeze coming thru that opening, and when the wind is strong in the street, there is a living gale between those buildings.

It is but a short distance, a matter of a minute's walk, from the entrance between the buildings to the principal hall. Once inside of it I am "on my own cabin floor." There is neither a nook nor a corner in it that I have not explored thoroly. I have examined the busts in the lobby carefully, when nobody happened to be looking—of course, my impressions were all tactile; but I dare say they are a bit more accurate than the casual glances many of the students give Augustus and Cicero. Let us go into one of the classrooms, an unoccupied one, of course, where the shades are all up. How do I know it? Why, I feel the impressions of light upon my forehead; the light produces an exhilarating stimulation of the nerves there. There is a feeling of mild joy aroused by the light. When I enter a dark room, the one next to this, for instance, there is an absence of this stimulation, which is accompanied by a feeling of depression. You see, therefore, that tho there is no vision in this world I live in, there is still sensibility to light impressions.

Let us now go to the smoking-room; it is located in the basement. Many an idle hour have I whiled away there over a chessboard; it was there that I first learned the noblest of games. I have been on many a hard fought field, and more than once the troops which I martialed have been victorious.

Thousands of memories hang about this old smoking-room, with its leather-cushioned chairs and settees, its buff-colored walls (I have been told that this is their color), and cement flooring. Many an hour I have spent there bantering with one or another of my fellows. I can picture them now, lounging lazily in the easy chairs and on the settees, puffing languidly at their pipes and cigarets.

A fellow near me drops a coin. I tell him to pick up the quarter he has let fall, and, with surprise in his voice, he asks me how I knew it was a quarter. I tell him that I can recognize any coin by the sound it makes when it strikes the floor. This is, however, not my only means of distinguishing coins; in most cases, I depend entirely upon my sense of touch, but I have discovered that I can recognize coins placed in the palm of my hand. For this reason I rarely count my change, unless it be given to me in a comparatively large number of small coins, and I rarely make a mistake.

Another fellow comes up to me—I need but hear his step to know him; he knows that, too, but seems surprised that I am "so good on the guess." I am acquainted with a large number of the students whom I can recognize the instant they

speak, but there is one among them whose breathing I need but hear. He has attempted many times to catch me napping; he has disguised his voice, come up on tiptoe and taken hold of my hand in new and peculiar ways; but always his peculiar catarrhal breathing has given him away. And, too, there are a few whom I can readily recognize when they merely take hold of my hand.

A man gives his character away quite as much in his voice as he does in the expression of his face. I need but hear a man speak for a few minutes, and I am as sure of him as I am of myself. Let me talk with a man for a quarter of an hour, and I know him—not so much by what he says as by the way he says it. I think that it is Charles Lamb who said, "Tell me what you laugh at, and I will tell you what you are." If he is a reckless fellow, I know it as well as if I had seen all his reckless acts. If he is just an educated donkey, he may hids his ears, but he cannot disguise his braying. I have sometimes made more accurate judgments of men than others have done with all their eyes.

But let me not tire you with my memories; it is growing late. We may meet new experiences on our homeward journey.

At the first crossing a young lady offers to help me over the street. I judge that she is not much above twenty. I judge, too, that she is rather pretty. Now I cannot tell what there is about a woman that tells one whether she is pretty or not; but there seems to be something in her manner that speaks more eloquently than words. In the voice of a beautiful woman there is a note of the expectancy of the homage due to beauty. In some cases, I have detected a tendency toward coquetry; and this is more rare in women who have no particular physical beauty. There is no evidence of coquetry in the voice of this young woman, yet I am of the opinion that she is something of a "good looker." As we cross the street together, we talk; oh, never mind what we talk about; we have time only to comment upon the weather. But her voice is attractive. There is rich music in it; its shading is most delicate and its modulations are most graceful. She has no sooner left me than one of my friends, a collegian, comes up to me and twits me about "picking up a winner."

At the next crossing I suspect that something has happened since I last past it, namely, that men have been at work digging. I am not desirous of tumbling into the pit they have made; therefore I wait for assistance, which some passerby is only too willing to give.

The streets are fairly quiet, now that the lull in the traffic has come as it does at this hour, so that I may cross them without assistance, all except the very busy one I mentioned above. When I reach it, a man with a voice as colorless as chalk, or rather, as toneless as a kettle-drum, and with very blunt manners, offers assistance. Of course, I do not refuse it because he is so bleached-out a character.

At the next crossing there is a street piano playing "Everybody's Doin' It." Unconsciously I fall into step with the rhythm of the music, as I have observed many others doing under similar circumstances. I must have had the appearance of listening intently to the clanging music of the instrument (if it can claim the dignity of being called an instrument), for a woman whom I have often met in my many peregrinations comes up to me and asks if she may give me assistance. But her first remark is, "Oh, you like music too, I see." What a charmingly profound observation!

Now, before we go home, let us get some cigars. We need have no assistance in finding the store, for in this warm weather most of the storekeepers have their doors wide open. I can locate the shop by the odor of the tobacco. Most stores can be recognized in this way, but the most difficult of all is the bakery—not that it lacks a distinctive odor, but because it makes so much of itself one finds it difficult to know just which of three or four places is the source of the odor.

I shall have to ask you to excuse me this evening; I have an engagement. But don't hurry, we shall finish our cigars first. It is still only a quarter of seven, and I have a half an hour more at my disposal. You wonder that I can tell the time by touch. You have never seen a watch of this sort? Well, I can tell you

within a minute the correct time. No, I do not move the hands when I touch them. The best evidence of the truth of this is that the watch loses about a minute in two weeks, and the variation is always the same.

In regard to that engagement, I have no memorandum of it in writing. I trust my memory for that, no matter how numerous the engagements be. I carry a directory about in my head, with all necessary addresses, 'phone numbers and car lines. No, there is nothing remarkable about that; just reflect for a moment that I have been doing it all my life and you will realize that it is quite ordinary.

You may think that this has been an unusually eventful day; it is, on the contrary, quite commonplace. It is a dull day, indeed, in which as many adventures, as I like to call them, do not befall me. More than half the days of the year are as eventful as this. Occasionally I meet an interesting person at every crosswalk. But such days are rare indeed. Now I must go, but may I ask you one favor? Just help me to the car, if you please; the north bound one, I mean.

Oshkosh, Wisconsin.

The Master Cause of High Prices

Modern Methods of Gold Production Have Made Us Richer Than We Can Afford to Be

By Obed C. Billman, M.P.L.

[Mr. Billman, who is a lawyer by profession, has been a close student of economics for many years and has been an occasional contributor to the magazines on economic themes. The following article is based on the latest authentic sources of information.—EDITOR.]

Gold is King. From time immemorial, gold has been the chief standard of value. It is perhaps the only institution which has been handed down from savagery and adopted and defended by the principal civilized nations of the world.

The quantitative theory of money, *i. e.*, that any decided increase in the volume of money will be followed by rising prices for every commodity measured by it, and *vice versa,* has been generally accepted. This has been termed the "law of supply and demand." Every ounce of bullion offered for coinage decreases the purchase value of every coin stamped by the government.

It is not the province of this article to discuss certain well known and understood primary and secondary causes for sudden fluctuations in values as applied to financial securities, or the prices of certain commodities of life, in this and other countries, not to be purchased in the open market. The world's general commodity values, however, have been greatly enhanced by the enormous and constantly increasing production of gold.

Science, invention and the machine have conspired to demolish the gold standard. The time has come when gold is an article of manufacture. The machine has made gold a common metal.

It appears that prior to the discovery of America by Columbus the production of gold and silver, known as "the two precious metals," was fairly constant. At that time no one ever dreamed that either metal would become less valuable thru the luck or activity of its miners. Neither was there any strife or jealousy between the holders of the respective metals. In spite of the centuries of careful hoarding of the yellow metal, there was less than $250,000,000 of gold in all Europe when the great discoverer first sighted the western continent. Until this time it appears that the world plodded along with the modest and steady production of about $4,000,000 of gold annually.

For ages economists recognized the fact that the best interests of the people required a standard of value that would remain unchanged. It was but natural that, during the conditions which obtained prior to the nineteenth century, they should turn to "the two precious metals." During the three centuries fol-

lowing the discovery of America, the world's annual increase in gold production was about $26,000. It should also be remembered in this connection that silver was not discriminated against until the year 1816, when it was demonetized by England.

During the initial years of the last five centuries, the annual production of gold was as follows:

1500	$4,000,000
1600	6,000,000
1700	7,000,000
1800	12,000,000
1900	254,556,000

At this time, 1900, practically every nation on the globe, with the exception of China, had thrown silver out of its mints, and even China's bonded debts are payable in gold.

Beginning with the Australian and Californian mining activities the world's gold output in 1849 was $27,100,000; in 1850, $44,450,000; in 1851, $67,600,000; and in 1852, $135,150,000. A zenith of production, $161,250,000, was reached in 1856 and not again attained for thirty-eight years. In 1896, the year of the free coinage of silver agitation in the United States, the world's output of gold was $202,251,000.

Some years ago it was discovered that the soil in the Sacramento and San Joaquin valleys of California was filled with gold. Science and invention were again called on for assistance. The turbine wheel and the electric wire have added hundreds of millions to the gold supply, and their mission is hardly begun. The distant mountains were made to furnish water power for electricity. Dredging appliances were brought into service, and mud and dirt were made to yield up their golden treasures on what may be termed floating gold factories. It is estimated that these gold factories are adding $10,000,000 annually to the world's rapidly increasing gold supply.

When the discovery of the Witwatersrand district of the Transvaal of South Africa was made in 1884, the greatest deposits of gold in all history were made known. There are said to be billions in gold scattered thru the rocks and soil of this region, but not until recent years has invention supplied the new processes necessary to extract it with great profit. This gold-bearing reef is 45 miles in length, 22 miles in width, and borings to the depth of from 3000 to 3500 feet show gold in undiminished quantities. It was claimed by the late Joseph Medill, of the Chicago *Tribune*, as the result of a careful and conservative estimate, that the discovered ledge of the Transvaal contained enough gold to supply every human being on earth with $30,000 of it. New and improved mining machinery make it possible to handle at a great profit gold-bearing ores heretofore valueless. Altho the ore of the Witwatersrand runs but 10 pennyweights to the ton, it is uniform; it is therefore simply a question of machinery and labor to determine the yield. Modern machinery and the army of poorly paid coolies and native (colored) laborers in the stupendous mills make it a veritable gold factory, rolling forth an ever-increasing flood of gold which the world is compelled to absorb. The annual production of these "gold mills" of the Transvaal is now over $150,000,000. From late Government statistics, Consul Edwin N. Gunsaulus, of Johannesburg, notes a constantly increasing output of gold in that country. The Transvaal produced in the year ended June 30, 1909, 7,294,711,855 fine ounces of gold, valued at $150,793,303, an increase of 583,275,269 ounces and $12,057,230 over the previous year. The Witwatersrand area alone turned out 7,038,306 ounces, worth $143,492,903. Of the estimated gold output of the world for the year 1909, the Transvaal furnished nearly one-third.

The annual production of the three principal gold-producing countries from 1894 to 1912, inclusive, was as follows:

Year.	United States.	Africa.	Australasia.	All countries.
1894	$39,500,000	$41,760,000	$40,271,000	$181,175,000
1895	46,610,000	44,798,000	44,554,000	199,304,000
1896	53,088,000	45,185,000	44,407,000	202,251,000
1897	57,363,000	58,558,000	52,665,000	236,073,000
1898	64,463,000	80,128,000	64,860,000	286,879,000
1899	71,053,000	73,023,000	79,321,000	306,724,000
1900	79,171,000	8,672,000	73,498,000	254,556,000
1901	78,666,000	9,089,000	76,880,000	262,493,000
1902	80,000,000	39,023,000	81,578,000	296,737,000
1903	73,591,000	67,998,000	89,210,000	327,702,000
1904	80,723,000	85,519,000	87,767,000	347,087,000
1905	88,180,000	116,695,000	85,926,000	377,135,000
1906	94,374,000	140,361,000	83,406,000	400,426,000
1907	90,437,700	160,072,000	76,906,000	404,854,000
1908	94,560,000	166,520,000	73,327,000	441,932,000
1909	96,500,000	168,830,000	71,980,000	457,567,000
1910	96,055,200	155,730,260	65,329,705	465,847,786
1911	96,890,000	185,555,000	65,299,950	452,096,500
1912	91,685,000	205,978,325	62,521,050	466,512,700

It will be seen that the world's production of gold in 1912 was $466,512,700—almost double what it was in 1900.

The gold production of the world in 1912, despite a decrease of approximately $12,000,000 in the value of the output of the United States, Australasia and Russia, shows an increase over the value of the output of 1911 of $14,416,200, making the production for the year $466,512,700. Africa continues safely in the lead with a production valued at $205,978,325, comparing with $185,555,000 in 1911. Africa has been the ranking gold-producing country since 1905, when its production was valued at $116,695,000.

The United States, with a decreased production of a little over $5,000,000, holds second place among the gold-producing countries. The output in 1912 is valued at $91,685,000, and compares with $96,890,000 in 1911.

Canada, by reason of its Porcupine operations and the increased output in some of the older districts of British Columbia, made a large gain in its production, the estimate at this writing placing the value at $13,900,000. This gives this country a ranking of sixth among the world's larger producers.

In 1873, when silver was demonetized in the United States, the total annual production of both metals in all the world did not exceed $175,000,000, and in 1896, a period of financial depression in this country, the Democratic party declared in favor of remonetizing silver, while the "single gold standard" advocates declared that there was plenty of money in circulation and insisted that an increasing supply of money would bring calamity to the nation. It was pointed out that any decided increase in the total volume of money would result in higher prices. Foods, rents, and all the comforts and necessities of life would rise in price faster than wages. They were right, but subsequent events have shown that the argument applies with greater force to gold.

Altho the people were thus warned against the evils of rising prices, they have witnessed since that time prices which mount steadily, and will continue so to do until a stable standard of value is adopted. This step will be taken when it is fully realized that the enormous production of gold, due to improved mining machinery and extensive gold-producing ores, has made the single gold standard the friend of inflation; *hence the high prices which obtain thruout the world at the present time.*

In view of the above, what can be said of the *constancy of production* of such a metal and its *non-fluctuating* character as a standard of value?

It is not believed to be an exaggeration to claim that the gold dollar of 1913 *has less than* 10 *per cent of the purchasing power of the gold dollar of* 1800.

It will be seen that gold has become a machine-made standard of value. It appears that the gold standard was based on man's inefficiency in coping with nature, but such inefficiency is only found among savages and machineless races of men.

It has recently been suggested that the nations of the world get together and by gradually increasing the amount of gold which the standard coins represent do away with the constant depreciation of the purchasing power of these coins and consequently end the constant appreciation of the things which the coins will buy. Reference is here made and indorsement given to Prof. Irving Fisher's plan for an "international standard of value," to be fixed and regulated by an international monetary commission, as outlined in his articles entitled "A Stable Monetary Yardstick," in THE INDEPENDENT of September 26, 1912, and "An Unshrinkable Dollar," in the issue of January 2, 1913.

A new, universal and stable standard of value should be adopted, and greater elasticity in our currency insured by the enactment of laws providing for an emergency issue in times of great demand for legitimate commercial purposes, and securing retirement as soon as such demand falls off.

Cleveland, Ohio.

Libraries That Pay

Efficient Business Houses Are Systematically Bringing Managers and Mill-hands into Touch with Classified Information

By Metta M. Loomis

Librarian of the College of Medicine, University of Illinois.

A large contracting firm that had confined its business to the East was considering an extension of trade when a desirable opening was unexpectedly presented.

"I met some of the interested parties," the manager explained to his assistant, "and I don't see why we can't handle this contract. The only drawback is that the short time allowed for submitting bids won't allow an investigation of local conditions. My friends who are financing this deal can't give much information that we must have before making our bid. Here are the plans and specifications. I'll go over these and you go after the outside information. Study the labor supply. See whether we can get enough help from Denver—or must we ship our men from farther east? Learn the kind of laborers, whether 'Bojacks,' Chinks, Mexicans or what. Find out about food supplies and where we can get boarding cars. Some geological map might indicate local supplies of sand and gravel. Get freight rates from the nearest source of supply. Look up railroad facilities and road conditions from the nearest station to the site of the dam. Another important thing is the climate. How many months can we work? Is there danger from freshets necessitating temporary dams?"

The assistant spent three days visiting railroad offices, land agents, libraries and newspaper offices, but the information he secured was indefinite and unreliable. He found trade journals—hundreds of them, transactions of every conceivable society, government documents covering an innumerable range of topics, and house organs constituting veritable business encyclopedias; but to secure definite information was a hunt for the needle in the haystack. Without a knowledge of the sources of information and experience in gathering data from masses of printed matter, it was not surprising that the meager report prevented the bed-rock bid that might have landed the coveted contract.

Business has grown so enormously and has become so complex that few men of affairs have taken time to consider the increasing quantity and quality of printed matter devoted to trade and industry. Not until some crisis like the loss of the irrigating contract does the average firm awake to the importance of collecting, classifying and systematizing the material which will furnish the key to so many business problems. The need for such work is often felt, but not fully realized except by some enthusiast—perhaps some college man who remembers the efficient library service of his student days. This enthusiast may try to stir his firm to action, but it usually requires some exigency to demonstrate the wisdom of such an undertaking.

Mr. Breen, president of a company manufacturing electric railroad equipment, was invited to read a paper on "The Markets of South America." "Couldn't have suited me better for a topic," said he. "We have filled a few orders and I have read several fine articles, especially one I saw giving practical information and statistical data."

Here the matter rested till one morning Mr. Breen sent his secretary to the library, saying: "Get all the dope possible on this subject and have it ready for me at 11 o'clock, when I will be over. Be sure to find an article that came out a month ago, giving statistics of exports, duties, etc., to the various countries."

At 11 o'clock Mr. Breen rushed over to the library, in pleasant anticipation of his task. The secretary presented her collection—six articles—all of them in journals from two to five years old. Mr. Breen glanced quickly at them, and with all the energy allowable in a well regu-

lated library declared that the stuff was all rot. He called for the indexes, but to his surprise and dismay he found the trade papers are not listed in the regular indexes, and upon examining the trade journals themselves he found that few even compile annual indexes. The wasted time and the inadequate information set Mr. Breen to thinking. Out of the throes of those few days and the humiliation of presenting an unsatisfactory paper the commercial library of this firm was born.

Commercial libraries are no longer an experiment, but are recognized necessities in institutions as diverse as banks and hospitals, department stores and civic organizations, insurance companies and manufacturing plants. To select, classify and systematize printed matter does not make a commercial library; it is only installing the necessary machinery for the real work of taking the right article to the right man at the right time. The librarian of any business library should have special training in collecting and handling masses of printed matter. Specific knowledge is not so necessary as the ability to get information into or out of people; the daily work with the literature of a subject will give the librarian a constantly increasing fund of technical knowledge.

Commercial libraries work either thru the heads of departments or directly with the individual employee. By the former method the librarian must come into touch with each department, learn what problems are being considered, and then marshal the resources of the library to aid in their solution.

A large concern with offices quite separate from the factory maintains a library conducted entirely by departments. About seventy-five journals are received, the popular ones in duplicate or triplicate. There is also a constantly increasing accumulations of house organs, circulars, advertising matter and other forms of business literature. A routing record is kept of publications which are sufficiently valuable to be regularly read. In this way the information of the technical article and the ginger of the inspirational article react on the many rather than the occasional subscriber. The librarian attends the meetings of the department managers, and in this way and by personal conferences determines how the library may best serve the business. With this knowledge as a basis or in response to requests the librarian selects journal articles, clippings, trade reports, efficiency talks—anything useful or inspirational—and sends them to the department managers, who pass them along in one form or another to the men under them.

This firm maintains a smoking room which the librarian calls his "publicity department." Here is a bookcase with popular journals and books, also a bulletin board used to list articles of special interest, to call attention to items in the daily papers, and to announce lectures, exhibitions, etc.

After the journals have gone their rounds and return to the library, those uniformly valuable are bound, the others clipped and the articles filed by subject in manilla envelopes. A card index lists articles in the bound journals, so that a glance at the clippings and the cards shows the resources of the library on any subject. The many demands made on this department necessitate the most efficient organization of materials.

This particular library has been operating about a year and its tonic effect is felt thruout the entire system. The enthusiastic promoter is astonished at the avenues of usefulness that constantly open up as the work is organized and brought to the attention of the employees.

A commercial library working directly with the employees and extensively used by the overall workman as well as the tailor-made employee is managed by a committee selected to represent the various departments of the concern. It contains technical books, public documents, pamphlets, patent office records, mounted maps, clippings, blue prints, directories, competitors' catalogs, and catalogs used in the offices and shops, a historical collection consisting of all publications issued by the firm, and newspaper and journal articles dealing with this concern. A particular feature of this library is a weekly bulletin which contains an alphabetical list of useful articles found in the three hundred journals which the library receives. The bulletin gives the

full title, some descriptive matter, exact references to the periodical, and states whether it is illustrated. Bulletins are sent to all employees, branch offices, and to the salesmen on the road. Articles of particular interest are noted and sent to the man charged with the work covered by the article. About one thousand are on the list to receive the journals as issued. Telephone connections make it possible for any employee to set the library force working at any problem at a moment's notice.

"Hello! I want all your stuff on the premium plan of paying employees. Send a boy over with it right away."

"Hello, librarian! Hunt up a good line of ginger talk. I shall need it before five o'clock."

"Hello, Miss! Has you'se a good book on how to make air ships?"

"Hello! This is Price. I want the exact wording of the Wisconsin Compensation Act. I will hold the line."

Statistics of this library show that the requests for material increased 200 per month, and calls for journals increased 400 per month, during its early history.

An engineering firm with headquarters in a large city has a library far famed for its efficiency. If one were to ask regarding the equipment, he might be told that the equipment consists of one librarian, and the librarian would say: "It isn't a library, simply a library laboratory, as it depends on the extensive technical libraries of the city. I am simply a go-between our firm and the libraries." The large dividends which this service pays are earned in the saving of time which an expert in handling printed matter is able to effect for the members of the firm. A variation is being worked out in an eastern city, whereby a trained librarian spends two days a week in each of three institutions.

The methods of work of these libraries vary as do the businesses they serve. Each pays dividends in proportion to the interest taken by the managers and the aggressiveness of the librarian in acquainting the workers with the resources of the library and meeting the demands for material. The practical value of a business library is attested by Patrick's reply to the question: "How did you fix your saw? It always used to slip cogs occasionally."

"Well, sorr, the boys told me to go to the library. I never thought libraries had books about saws, but I went in and the library lady found me a book that told all about it, and after I fixt my saw I kept going in every week and reading a bit about me work." There may be few cases in which the library is so directly beneficial, but even the Irish workman knew that the library had enabled him to boost his pay check by increasing his efficiency. He also realized, as did other laborers, that this was a great opportunity for men and boys in the field of unskilled labor to get the benefits of some vocational training outside the workshop.

To this report from a toiler of the shops should be added the appraisement of the men who build and direct these great industrial institutions. One of them exprest himself thus: "Yes, our library is a business asset. We need all available printed matter arranged in a manner to be made negotiable in order to benefit by the labor of other men's brains. It saves us from the expense of error in the present and points the way to future economic development. It is a clearing house of useful information. And more than all this, those who manage large numbers of men are learning that human happiness is a realizable commercial asset, and to add to this human happiness business firms are building rest rooms, gymnasiums, playgrounds and libraries—because they pay in dollars, not in sentiment."

Another speaker summed up the matter as follows: "The library pays directly by the improvement in methods, but it pays far more in the improved personnel of the force. At the foundation of business lie courage, competency, integrity, perseverance—these are the moral assets out of which the material assets grow, and our library is the most powerful agency now contributing to these fundamental possessions which produce the dividends of this concern and of every concern."

Urbana, Ill.

The Japanese Question from a Californian Standpoint

By James D. Phelan, Ph.D.

[The anti-Japanese movement in California, so little understood in the East, is here interpreted by one exceptionally well qualified to speak for his state. The author was born and educated in California and has been a leader in the reconstruction of San Francisco, architecturally and politically. He was mayor of San Francisco from 1896 to 1902. Our own position, which is quite the opposite of Mr. Phelan's, we have made plain to our readers on more than one occasion and the relations between Japan and the United States have been discust from various points of view. Those who wish to follow up the subject may find useful the following references to recent numbers of THE INDEPENDENT: "Japanese Incompatibility," June 12; "The Controversy with Japan," "Foreign Landowners in Japan," May 29; "California and Japan," "Japan in 1913," by D. C. Greene, "Japan and America," by H. T. Sudduth, May 22; "California and the Japanese," "Novel Lawmaking in California," May 15; "California Insistent," "How California Treats the Japanese," by K. K. Kawakami, May 8; "Secretary Bryan's Visit to Sacramento," "Japanese Exclusion," by D. S. Jordan, May 1; "California and Japan," April 17; "California Pertinax," April 10.—EDITOR.]

The Japanese problem is peculiarly one on which California has a right to speak and to be heard. According to the last census, the Japanese population in the United States was 71,722, of which 55,100 were in California; and I claim that nothwithstanding the "gentlemen's agreement" their number is increasing. Japanese are smuggled into the United States from Mexico and British Columbia. They swarm our richest valleys, and have invaded our cities and towns. They are skilled agriculturists and unassimilable, and therein is the menace of their presence.

All the white man's countries fronting the Pacific have the same problem, and have, in different ways, attempted its solution—Australia, New Zealand, and British Columbia. Now, there must be some reason for this widespread opposition to the Japanese. It is this, stated in the terms of experience: they have driven the white man out of employment in his own country; they are capable of exterminating him if unrestrained. The Japanese have, for instance, taken possession of the fisheries of the Fraser River, British Columbia, and have actually displaced the English and Canadian fishermen. In Vaca Valley, and in parts of the Sacramento and Santa Clara valleys, and elsewhere in California, they have in a like manner exterminated the white settler. Their method is this: They first take employment as laborers and learn the business; they then underbid the white tenant and take a lease; then they demand a share of the crop, and finally acquire the fee of the land itself. Here we find the salient fact that the man who has pioneered the country, reared his family, and created all the evidences of our Western civilization—the church, the school, the theater, the social life and the higher aspirations exprest in a happy home, is suddenly thrown in competition for existence with an alien who respects neither holidays nor hours of labor, and who owes no duties either to society or to the state, but who may be regarded as a perfect human machine, given to ceaseless and unremitting toil. As such he is a success.

In the place of a sturdy white population—assimilable and homogeneous—we have an alien, incapable of assimilation, loyal to his home government, and hence composing a permanent foreign element in our midst. In other words, we have created a race question, against which all history has warned us: where two races are endeavoring to live side by side, one must take the inferior place, or an irrepressible conflict is precipitated. Just as a foreign substance will derange the human system unless it is expelled or encysted, even so is it with the body-politic. The Japanese will not go, and will not be absorbed. There is the problem.

In the lower Santa Clara Valley a visitor recently one Sunday morning beheld a large number of Portuguese and Italian families surrounded by their children and friends enjoying, in a rational way, their holiday—the day of rest. These people—who soon lose their racial characteristics, at any rate in one or two generations, and become a part of the American population, participating in the political and

social life of their country—in order to survive, will have to get down to the level of the Japanese, and pursue the same methods. In this same district, the visitor also saw, on this Sabbath morning, large numbers of Japanese working in the fields, where intensive farming is carried on, (in which also the Portuguese are adepts), and by their side working were their women, and on the backs of the women were strapped their babes. They work thus fourteen to sixteen hours a day—eat little and play not at all—and already thru their associations have substantially control of the potato market, berry market, and the cut flower market, and, generally, garden truck.

The Alien land law is enacted to prevent this class of immigrants getting a footing on American soil, because so soon as they get a footing, they are capable of unconsciously undermining the structure which the Fathers have erected under the flag of the United States for the perpetuation of the life, liberty and happiness of their own people and those who become a homogeneous part of the country's population. Of course, the naturalization laws were addrest to Europeans and did not contemplate Orientals, who, even in the earliest days, were regarded, in the American sense, as indigestible. The men who originally opposed the introduction of negro laborers took the same ground, that being essentially foreign and unassimilable, the negro would create a race classification, which would be repugnant to American institutions and would destroy the idea of equality. It is, therefore, a question of preserving California as a white man's country, upholding American standards and civilization, or abandoning it to an alien people capable, in this fierce competition, of either exterminating the whites or of reducing them to a hopelessly lower economic, social and political plane. The contest would be a human machine against a human machine, without any consideration for the spiritual, intellectual and political betterment of humanity. A free government such as ours depends upon the intelligence, patriotism and prosperity of the people. It would be fatal to impoverish and destroy the men and women on whom we depend.

In this view, we have to eliminate any question of increased production, or pride in statistical tables of great wealth. They are of minor importance. It is the proper distribution of wealth among the people that concerns us most. Amicable relations with a foreign government must yield to a proper regard for the welfare of our own people. The Alien Land act might well be described as an act of self-preservation.

The Japanese, on the other hand, have a country of their own. They have outlying territory in need of settlement and development. The only reason why they come here is because of the higher remuneration they receive. They are not bona fide settlers in the American sense. They do not seek asylum. We therefore do them no injustice by barring them from our fields, because they have a great destiny to realize at home. We marvel at what they have accomplished. There is no question of inferiority raised—only undesirability.

Let the good people of our country take a patriotic view. California, the warder by the Golden Gate, sounds the alarm. Let them keep before them the image of Hawaii, which cannot be properly called American territory, because it is abandoned to the Japanese. Help to save California, perhaps the fairest of our states, from a similar fate. The choice has to be made between the people of our race and the Oriental. Let us favor our own, and thus ensure peace and prosperity.

The Panama Canal will people California with assimilable men and women, strengthen the foundations of the republic, and keep safe this country for those who come seeking liberty, and who are ready and able to render reciprocal service.

San Francisco, California.

Freeholders Wanted!

A Plan to Relieve City Congestion by Making Home-Buying Possible

By J. Pease Norton

[Mr. Norton has for several years past been assistant professor of railway and trade statistics in Yale University. He organized the American Health League and is a member of many economic associations here and abroad. He has written books on the New York money market and the theory of loan credit in relation to corporation economics. The results of his inquiries as to the causes of the increased cost of living have recently been published.—EDITOR.]

To secure a high degree of national stability, it is important that the class of home-owners shall steadily increase, not only in actual numbers, but also in a relative percentage to the total population of a country. A tenant class has been and, perhaps, is an economic necessity, but the strength of a nation lies in the number of the freeholders. The economic meaning of this truism is plain in a rational analysis. The small family group, with a homestead free of debt, is able to stand readily—at least, more readily—the time of pressure when work is short or sickness comes, because the rent collector and the possibility of ejectment are eliminated. The struggle in times of economic stress, hard as it may be, is for food only, and not for food and rent. Sociological statistics plainly indicate that a train of evil consequences starts from the ejectment of a family, especially when the wage-earner is temporarily out of work.

To encourage the freeholder has been an object of government action from the earliest times. Free homestead laws and the generous policy of division of vast areas of government land among home-seekers are more characteristic of our national Government than of other nations, with few exceptions. But this policy has applied to the frontier and not to areas of the settled country, notably not to the city and to the slum. Other countries, like England, have attacked valiantly the colossal problem of eliminating the slums and in some cases have gone so far as to provide model tenement houses, but the writer believes a far more promising possibility lies in a wise financial policy which will make a home easy of attainment.

The difficulty and the risk of maintaining a home under the present system tends to delay marriages. Postponement of mariages destroys to a considerable extent the possibilities of new families thru a long train of economic sequences which are now the subject of most thoro investigation by the new Bureau of Social Hygiene founded by Mr. John D. Rockefeller, Jr. In fact, the evils of great cities are produced by this departure from the earlier state of affairs in which land was cheap, homes easily acquired and marriages made early.

The problem of congestion in cities must be solved, if the solution is to be constructive, by striking at the economic roots of the difficulty. This sociological problem requires, first, the determination of the essentials of an ideal house. What are the best plans, the most economic and the most sanitary? Suppose the Bureau of Homes in a national Department of Labor and Health should throw open to competition among architects of this nation the planning of a series of sanitary homes for one acre plots of land, and that fifty or one hundred plans should be selected by competent judges, as model plans for sanitary houses. If one hundred such plans were published in a government pamphlet, they might be designated as "standard homes completely specified," which would establish at any time the reasonable cost of construction.

If any citizen desired a home, he could apply to the state office of the Bureau of Homes, stating the location of the land and the plan selected from this pamphlet. Let the bureau authorize a standard mortgage up to fifty per cent of the taxable value of the land plus the cost of the house selected. Let the interest be fixt at four per cent and such a standard mortgage be open for investment to postal savings bank depositors who wish to change over from the class of regular depositors to owners of government bonds under the present system. Against these mortgages, the government would

issue mortgage bonds. From every standpoint of statesmanship, it is surely as enlightened a policy to permit the savings of the people deposited with the government to go into such certificates representing the security of the homes of the millions of our people as to invest the savings in a Panama Canal.

Whatever plans are finally developed, strict attention should be paid to state lines in the allotment of the mortgage fund, and the division should be on the basis of population. Possibly the rate on the mortgage certificates should be three and one-half per cent, thus leaving a margin of one-half per cent toward the expenses of the system and to create a fund for contingencies. Obviously, standard mortgages should be issued with many specifications in order to promote efficiently the purpose of home making. For instance, standard mortgages should be open to families and to single women, but not to single men. Fire insurance policies, as now, should be required, and in addition life insurance policies on the lives of the wage-earners. The amount of each policy should be sufficient to extinguish the debt. The annual payment should be 4 per cent for interest and at least 2 per cent for the sinking fund. Additional payments should be received at any time, to reduce the face of the loan. Without additional payments, the 2 per cent sinking fund payment would, if invested at 4 per cent, give ownership in due time.

The total amount of the standard mortgage should be limited to two or three thousand dollars as a maximum amount. Failure to pay interest thru sickness or lack of work should be provided for by a sickness insurance policy sufficient for this purpose. Perhaps the government could furnish this out of the one-half per cent difference in interest. No second mortgage which provides for foreclosure in event of failure to pay interest should be allowed. It is possible that new mortgage contracts may be developed in the future which will not provide for ejectment, but will depend for security upon insurance covering the hazards of sickness, lack of employment, and bad faith. It is plain that an insurance company would be in a position to recover eventually, even in cases of bad faith, when the first or standard mortgage was liquidated by death. The government would give title upon death thru the action of the death policy.

Financial experts should be called in to plan with great care the details necessary to achieve such a national policy to promote the easy attainment of homes by the masses of the people. Rules requiring land to be located within a certain number of miles of a trolley line or a railroad would be advisable. It is possible that the Sage Foundation may eventually come to some such plan as the ideal solution of the purposes for which the foundation exists. It is plain that great interests, vital to the nation, are in the truest and highest sense conserved.

Let us enumerate the points which seem most promising in the project. First, the nation gains because the policy of home making is one which makes a nation strong and stable. Second, the family gains because a home becomes easy to obtain. Third, society gains because public health will be improved when sanitary homes are secured and the problem of congestion is met by a constructive solution. Fourth, real estate owners gain, because the value of farm land is increased. Fifth, the savings bank depositor gains because the interest to be realized is increased from the present figure of 2 and 2½ per cent to 3½ per cent. Sixth, railway and trolley lines gain, thru the increased traffic which would result as homes spread out over the country. Seventh, great social problems would be truly solved, because the evils of late marriage would be greatly reduced.

In a plan in which all gain and no one loses we find the most rapid progress in constructive economics. It is difficult to realize the enormous wealth-producing power of ninety millions of people, when honest opportunity is offered and not denied. The success of the postal savings bank shows already the response when people believe in the honesty of the government. An enormous fund is available for investment in standard mortgages when men come to believe in the stability of the security and the wisdom of the administration.

New Haven, Connecticut.

INDEPENDENT OPINIONS

This does not mean, of course, that they are the opinions of THE INDEPENDENT. On the contrary, they are opinions independent of THE INDEPENDENT and often called forth by the benevolent desire to set us right on certain points wherein we have failed to maintain the tradition of editorial infallibility and omniscience. For instance, we recently ventured some estimates on the vext question of the cost of running an automobile. These figures did not lie, but we are glad to learn that some of our readers have had a more fortunate experience. We quote from the letters of two Ohio men.

MOTORING FOR LESS MONEY.

Almost nine years of experience as the owner of an automobile (three five-passenger cars during this time) convinces me that both Mr. Clough in his article on "Can I Afford An Automobile?" in THE INDEPENDENT for June 5, 1913, and the editorial writer in the same number on "Owning An Auto" are entirely too high in their estimates of the cost of running a car. If it costs the average owner of a $1000 car $860 a year during a period of five years to run his car 5000 miles annually, the demand for cars would soon fall off amazingly, since few town people and farmers could afford such a yearly outlay, and of course the majority of the approximately million cars owned in this country are in the possession of town people and farmers. I will give estimates for five years based on my own experience and that of others whom I have consulted. We will assume that a good $1000 car was bought by a good average man on January 1, 1913. Cars have been standardized within the past few years, so we are justified in projecting the experience of the past five years into the next five years. Better engines and better tires and a better knowledge of the mechanism of an automobile on the part of both the average garage workman and the average owner are reducing year by year the upkeep cost:

	Jan. 1 1914	Jan. 1 1915	Jan. 1 1916	Jan. 1 1917	Jan. 1 1918
Depreciation	$200	$200	$200	$100	$100
Interest on cost	60	48	36	24	18
Average state fee	10	10	10	10	10
Average county tax	20	16	12	8	6
Fire and liability ins.	30	30	30	30	30
Depreciation on $250 garage	25	25	25	25	25
Interest on garage	15	13.50	12	10.50	9
Gasoline for year	80	80	80	80	80
Oil for the year	12	12	12	12	12
Tires and tubes	..	150	150	150	150
Incidentals	28	35.50	83	50.50	60
Total	480	620	650	500	500

Cost of car and upkeep for 5 years.....$2750
Old car worth in trade at least..... 250

Actual cost of car and upkeep 5 years.....$2500

Twenty-five thousand miles for $2500 during five years, or ten cents per mile, which includes everything that ought to be charged against a car except the labor of the owner. Since the average owner, to a very large extent, looks after his own car, this item should not be considered.

Unquestionably these figures are low enough for the average owner of a $1000 car. It may cost one owner more for one or more items, but he will maintain the average of $500 per year because of reductions for other items. Very few town and country owners of automobiles will express dissatisfaction with our figures under the following heads: Depreciation, interest, state fee, county tax, insurance, depreciation of garage, interest, cost of gasoline and oil and incidentals, tho many will save the depreciation and interest on garage by using as a garage a barn or shed that otherwise would not be used at all; fully as many will save the cost of liability insurance because they do their own driving and are always careful. But town and country drivers of $1000 cars will emphatically object to an outlay of $600 for tires and inner tubes in driving a car 25,000 miles. Not a few will demur at the idea of having to spend $257 for incidentals during five years. On the whole there is absolutely no question that the owner of a $1000 car who takes reasonably good care of his car, seldom driving it during the winter months and only using it when absolutely necessary in bad weather, will be more likely to fall a little below the figures given than to exceed them. In these estimates we are not thinking at all of the extravagant and reckless owners of $1000 cars, nor of owners that allow any and everybody to drive their cars at any and all times, nor of owners who have not ordinary horse sense in driving and caring for cars.

E. I. ANTRIM.

Van Wert, Ohio.

In the spring of 1912 I purchased a four-cylinder touring car of a well known and established make, and during the season of 1912 I drove this car 4067 miles. Exclusive of depreciation and the interest on my investment my entire expense bill for the

4067 miles totaled $122.80. This included gasoline, oil, license fee, insurance (fire and theft, but not casualty), the rent of a building in which my car was housed, all tire expenses and such repairs as were necessary—in fact all expense except washing the car, which I had done by a general utility man employed in our factory. I was very careful to keep a very complete record and included even such items as motor gloves, motor coat and everything purchased which I would not have needed had I not owned an automobile. I may say also that as I am not at all mechanical this expense bill included some items for adjustments which a man of some mechanical skill could have done for himself.

It will thus be seen that I operated my car at an expense of three cents per mile. The second season will probably cost a little more as tire expenses do not usually amount to very much the first year. However, I purchased one casing and one inner tube the first season and also some extra attachments for my car which it will not be necessary to purchase the second season.

As you are not advertising automobiles except on your advertising pages I do not give the make of the machine, but I am satisfied that there are several machines costing $1000 or less which can be operated at about the cost I have given. As I have said, I have compared my experience with that of a number of my friends and have found some whose expense was even lower than mine.

In my judgment, what militates most against the purchase of motor cars by people of moderate means is that so many of them are of the opinion that the smaller and cheaper cars are not very serviceable and not capable of giving the satisfaction to be obtained from an expensive car. This is very far from the truth. If I had the time to do a great deal of extensive touring I might want a larger and higher powered car, but as it is I am getting all the speed, all the dependability and all the pleasure I need, and I drove the 4067 miles without once failing to come in under my own power.

W. J. Oby.

Canton, Ohio.

ON THE CONTRARY.

I was the first owner of a machine in our city and expect to have the distinction of being the last one.

I contracted the automobile fever ten years back and was told the only cure for that disease was to buy a machine. This I did—paid seven hundred dollars for a little steam rig, and had a good deal of expensive fun with it. My first mishap was to run into a mortar-bed. Next, I was making a hurried run to catch a train—ran into an "upping-stone" near the curb and wrecked a wheel and pitched my niece head foremost into the ditch. Ran into a herd of cows coming from the pasture, with disastrous results. By this time I thought my fever was sufficiently cured to dispense with the machine; but there was no market for it. Finally the boys fell on the plan to raffle it. The unlucky holder of No. 1768 got it for forty cents. Poor fellow!

Notwithstanding this experience I found a trace of the fever remaining in my system. But I have it under pretty complete control. When it is at its hight I draw from my side pocket the table of figures given below, and a glance at this is all that is necessary. I have worked on these figures for several years—changing them up or down as conditions vary. I have gathered them from many sources, and shown them to owners of cars who have kept tab on their machines, and now feel the figures are under rather than over the mark.

I have figured on a car costing $2000, as being the most economical in the long run.

Memorandum as to cost per mile for automobile costing, say, $2000, and run on a basis of

5000 miles per annum.

Interest at 6 per cent	$120.00
Depreciation, 20 per cent	400.00
36"x4½" tires	200.00
Gasoline 10 miles to gal. at 18 cents	90.00
Oil and grease	15.00
Insurance	100.00
Garage	125.00
Incidentals	115.00
Six months interest on expense bill	35.00
Total	$1200.00

Twenty-five cents per mile. Say fourteen miles per day, $3.50. Representing an investment of $20,000.

10,000 miles per annum.

Interest at 6 per cent	$120.00
Depreciation, 20 per cent	400.00
36"x4½" tires	400.00
Gasoline 10 miles to gallon	180.00
Oil and grease	15.00
Insurance	100.00
Garage	125.00
Incidentals	115.00
Six months interest on expense bill	45.00
Total	$1500.00

Fifteen cents per mile. Say 27½ miles per day, $4.12. Representing an investment of $25,000.

Now where is the man, even tho he is getting $6000 a year salary, can afford to pay out 20 to 25 per cent of it in riding over the country?

My house needs paint, my wife needs clothes,
My boy needs shoes,
Among their needs, you may suppose
It's hard to choose.
No man could be in worse a strait
Between two fires.
I guess they all will have to wait;
My car needs tires.

R. P. Gettys.

Knoxville, Tenn.

From the General Secretary of the National Child Labor Committee we have received the following vigorous protest to an editorial on the Florida Child Labor bill published in our issue of May 15. It was not our intention to oppose such legislation, but to emphasize the fact that work is for children a good part, often the best part of education.

Such work to have its full educational value must be real and remunerative, not mere gymnastics. It is necessary to protect children from exploitation, but there is danger that in doing this the avenues of employment may become so restricted as to prevent young people from acquiring the training that comes only from productive occupation.

CHILD LABOR LAWS NOT DRASTIC.

You summarize the provisions of the Florida Child Labor bill, which forbids employment of boys under ten years or girls under sixteen in street trades; the employment of children under twelve in stores, offices and messenger service, and employment of children under fourteen in mills, factories, restaurants, hotels and similar places of occupation, and say "this reads like a myth. It seems impossible that reform should go mad to such an extent. Our social life is altogether too complex for such a drastic bill."

May we venture to ask to whom this measure "reads like a myth"? Certainly not to citizens of New York, Illinois, New Jersey, Ohio, Wisconsin and twenty-six other of our American states which have already established these or more advanced standards. We have just departed from this "myth" in New York in relation to street trades by forbidding the employment of boys in this occupation under twelve years of age; going two years beyond the standard established in Florida.

To whom does it seem impossible "that reform should go mad to such an extent"? Surely not to the thousands of educators, physicians, editors and other public-spirited citizens who have been seeking to protect young children from injurious or excessive forms of labor. Last August, in Milwaukee, the American Bar Association, after very careful consideration, adopted the Uniform Child Labor law by unanimous vote, yet the Uniform Child Labor law goes "mad" much farther than this Florida bill you caricature. The Uniform law provides that children under sixteen years of age shall not be employed for more than eight hours a day, nor without having an opportunity to lay the foundations of an English education. There are 25,000 illiterate children in Florida between ten and sixteen years of age and one of the motives leading the educators of that state to urge the adoption of this bill is the desire to secure to the children of Florida an opportunity for an English education. These are not foreign children, but are of native white stock.

If it is a question of education, let me remind you that the public school system in this country costs $400,000,000 annually, while our small committee is able to raise $60,000 annually. We submit that the educational side of the problem is up to the $400,000,000 crowd rather than to us. Our job is to see that the exploitation of young children is ended; that society learns to distinguish between "working and being worked"; and we believe that when children can no longer be made financially profitable to full-grown employers, the ground is better cleared for the constructive policies on which I am sure we all agree.

This bill was drafted on the model of the Uniform Child Labor law prepared by the National Child Labor Committee, but it was in several respects reduced in its standards in order to meet the peculiar rural conditions and backward educational development of Florida. The bill specifically states that children shall not be excluded from domestic pursuits or agricultural labor and that nothing in the law shall interfere with children gaining a practical industrial education. With what is said about the possibility of children developing knowledge from work and combining practical training with book learning we are in most hearty accord. But that issue is in no way involved in the question before the Florida Legislature.

As to interfering with the healthful and educational occupation of children, there is not a line in this bill. It was carefully drafted to provide for exactly that situation and to represent the point of view you express when you say that we must not draft legislation that assumes that labor is demeaning or injurious. The intelligent citizens of Florida congratulated us on having so constructed the bill that it met their local situation; gave an opportunity for children to be employed around home; recognized that the state is largely agricultural; and gave a word of encouragement to the further development of technical training in school. OWEN R. LOVEJOY.

New York City.

The first "Argument in Brief" on the Panama Canal tolls, tho published on May 29, after the debating season was mostly over, has already proved serviceable, as the following letter from the president of St. John's College shows:

I consider that the policy recently adopted in bringing live topics to the attention of your readers an excellent one.

The series of "Arguments in Brief" will be extremely useful, and it may be interesting to you to know that the literary societies have already availed themselves of your good help in preparing matter for their annual debate which takes place tonight.

The question to be discussed was adopted some time ago, and the arrival of your pamphlets and articles has been very fortunate in enabling them to get up both sides of the question. THOMAS FELL.

Annapolis, Md.

After the summer is over and our readers can afford to indulge once more in heated argument, we shall continue the series.

THE NEW BOOKS

New Art and Old Confusions

Nothing could be more different in tone than the two booklets on the newest art by Mr. Poore and Mr. Lauvrik.[1] The painter is sportive, ejaculatory, inconsecutive; the critic sober, painstaking and systematic. Whoever wishes amusement may be directed to Mr. Poore, whoever wants to know how the new art takes itself will do better with Mr. Lauvrik. Considering these differences, it is odd that both should make about the same findings and that both should decline to accept the logic of their judgment. The two observers agree that Post-Impressionism is excessively boisterous, infantile and "primitivistic," that Cubism has the vice of a wholly arbitrary symbolism—"a private code" of the artist. Mr. Lauvrik puts it, finally that Futurism is bumptious and sensational. Mr. Lauvrik thinks the kinetoscopic method "a puerile use of art." Mr. Poore finds it amusing and thinks it may have limited possibilities.

Of course neither ever uses such coarse and explicit words as your reviewer, but the above is a fair paraphrase of their argument in the language of every day. Having shown the extravagance of the new movements, having demolished them by implication, one would expect at the end something like an unfavorable verdict. Such an expectation merely evinces a lack of acquaintance with art criticism as she is written today. It is as if each author explained: "These are the results of my observations, but Heaven forbid that I should seem to hold any convictions on any matter artistic." Mr. Lauvrik at least gives fair warning. His first sentence is, "I believe nothing happens arbitrarily either in nature or in society. Nor do I believe there is anything absolutely useless either in the thought or in the acts of humanity"—a most pregnant and solemn sophism. Mr. Poore concludes cheerfully that the main thing is to give all charlatans and fanatics rope. "Tradition never needed saving: It somehow has a way of looking out for itself, and if it has not the seeds of perennial generation, it had better die." Again a sophism of noble and engaging type. If tradition does indeed automatically and effectually look out for itself, under what universal delusion are laws made and codified, schools and universities and academies most expensively maintained? One drops these books with the query whether the modern effort to keep an open mind is quite worth the trouble, and longing for a dash of old-fashioned prejudice.

In having a distinct tendency, Mr. Caffin seems to bring a distinct moral advantage.[2] Yet his goal is merely a kind of glorified university extension bureau propelling art widely in "eddies of Culture." In general his theme is that art is closely allied to any skillful action. Emerson has put the matter with terse magnificence in an essay recently recovered from the *Dial*. Mr. Caffin dilutes the idea so that it should lie easily on the tenderest stomach. Dilution is indeed his method. One sees that everything is making for a beauty loving and thoroly socialized democracy, but the processes are lost in a general flux the guiding marks of which are merely capitalized large words with shifting meanings. Certainly there is much amiss with art; much may, indeed, be hoped from a finer and truer democracy seeking expression. Any reform that restores to art its public and representative function will be beneficial. So far we wholly share Mr. Caffin's convictions, but what all this has to do with beaucratized art extension we utterly fail to see. At most such expedients are merely palliatives; in a society

that really loved art they would clearly be unnecessary. As a capital example of the muddled warm-heartedness now in high vogue Mr. Caffin's little book assumes almost documentary dignity.

That art survives her champions is evidence of her exceeding toughness.

Gains in Old Testament Criticism

The recent death of Professor Charles A. Briggs, of Union Theological Seminary, recalls the fact that just twenty years ago he and Professor H. P. Smith, of Lane Theological Seminary, were suspended from the ministry of the Presbyterian Church, largely on the ground of their adherence to the methods and results of the Higher Criticism, as applied to the Old Testament. Some ten years before, Professor Toy had lost his position in a Baptist theological school because he held similar views. The charges preferred against Professors Briggs and Smith made special mention of the blighting heresies involved in the denial of the Mosaic authorship of the Pentateuch and the unity of the book of Isaiah. But what a change has been wrought in these twenty years! In spite of an occasional persecution such as forced Professor Schmidt to leave Colgate and Professor Mitchell to leave Boston University, continual progress has been made until freedom of research and instruction has been practically established in every institution that pretends to be more than a recruiting station for some particular brand of medievalism. The right and duty of using critical methods in biblical studies have been fully achieved and vindicated by results, and the specific questions in regard to the authorship of the Pentateuch and Isaiah have been finally answered by the overwhelming verdict of scholarship to the confusion, if not the destruction, of heresy hunters and worshipers of tradition. The opponents of progress have been chagrined and defeated at every point. Professor Smith has long been known as the author of a standard Old Testament History projected along the lines of his "heretical" studies. Professor Toy, after a distinguished career as a teacher in Harvard University and a writer of important biblical works, now receives, as a testimony of the esteem in which the scholarly world holds him, a presentation volume of brilliant *Studies in the History of Religions*[1], prepared by nearly a score of his friends in England, Germany and America. Professor Briggs has been equally fortunate in obtaining the scholar's recognition and reward, and his latest book proves beyond a shadow of doubt that he died more "orthodox" in regard to *The Fundamental Christian Faith*[2] than the majority of his professional brethren who to-day find shelter in the fold from which his enemies drove him out.

No more striking evidence of the victory achieved could well be found than the almost simultaneous publication of four new volumes on Old Testament Introduction, which, coming from various countries and schools of thought, make conspicuous the revolutionary change which has taken place in biblical study and reveal the unanimity which at length prevails regarding established results in all important matters of Old Testament investigation. Each of these books is most admirably adapted to the end its author had in view and all are worthy the highest commendation. For the Home University Library Professor G. F. Moore, of Harvard, has written a masterpiece of condensation and clearness on *The Literature of the Old Testament*[3]. He gives a critical analysis and appraisal of the sources, with primary reference to the history of the literature and the development of the religion. Here we get the results succinctly and positively stated, with only hints at the processes and labor by which they have been attained. Professor Gray of Mansfield College, in his *Critical Introduction to the Old Testament*[4], goes more into detail in his discussions and often gives

[2] *The Fundamental Christian Faith.* The Origin, History and Interpretation of the Apostles' and Nicene Creeds. By Charles Augustus Briggs, D. D., D. Litt., Professor in Union Theological Seminary. New York: Chas. Scribner's Sons. $1.50.

[3] *The Literature of the Old Testament.* By George Foot Moore, Harvard University. New York: Henry Holt & Co. 50 cents.

[4] *A Critical Introduction to the Old Testament.* By George Buchanan Gray, D. D., D. Litt., Professor of Hebrew and Old Testament Exegesis in Mansfield College, Oxford. New York: Chas. Scribner's Sons. 75 cents. (This volume is in the Series of "Studies in Theology.")

contending views about mooted questions. The volume is written in a style perfectly intelligible to bible students who are unable to read Hebrew, and it will satisfy the needs of those desiring some introduction to the methods and literature, as well as the results of critical work in this field. Another American scholar contributes a volume of literary excellence and vitality in the form of *A History of the Literature of Ancient Israel*[5]. Professor Fowler quotes freely from the Old Testament and similar writings in other ancient literatures. He has used the results of critical research without specifically recounting them and has on this basis traced in a most inviting way the literary development of the Hebrew people. This splendid volume furnishes the most convincing proof of the value of studying the Old Testament, as other masterpieces of literature are studied. From Germany we have the most elaborate and substantial introduction to the Old Testament that has been written since such works began to garner the results of critical research. Professor Steuernagel is one of the younger group of Old Testament scholars and commentators who preserves an open mind, but does not run after the latest critical fad. His new *Einleitung*[6] is both thoro and careful. Not only the canonical books, but also the apocrypha and pseudepigrapha are fully and often minutely discust. While the author has not attempted a complete bibliography the references to the literature are abundant and include English and American works. This ponderous tome of more than eight hundred large pages will doubtless prove to be a standard for many years to come.

Taking these four works on Hebrew literature as representative, we may note some things in regard to Old Testament questions and problems that seem at least for the present generation of scholars definitely settled. In the first place the fact that two of these books are prepared for readers interested in literature as such, rather than in a collection of sacred writings, and that the other two follow the same critical processes in the name of religion, fully warrants the statement of Professor Moore that biblical questions hereafter are to be "approached in the same way in which we should deal with similar questions in any other literature; critical problems, whether in sacred texts or profane, can be solved only by the application of the established methods of historical criticism." Not only must literary and historical problems be so solved, but without these solutions one cannot understand the life, literature, history and religion of the Hebrew people. It is impossible to grasp fully the literary and historical values in the Pentateuch without first distinguishing the different layers of narrative represented by J, E, D and P. This analysis is fundamental to any adequate study of these books. The four volumes we have been considering agree in making J the oldest of these narratives, written somewhere about the ninth century B. C. E comes next in point of age and was early united with J. D comprises the larger part of Deuteronomy and originated in the time of Josiah about 625 B. C. While the Priestly document, designated by P, covering many of the levitical laws, contains older sections, its narrative portions and final form are all post-exilic. So much seems to be definitely settled in Pentateuchal analysis. All our authors agree that Isaiah is a composite work, the product of several writers living at different periods, and that the latter half of the book is entirely exilic or post-exilic. They place the book of Daniel in the Maccabean period and find that many of the psalms belong to the same era, and that all received their present form after the exile. They regard the Song of Solomon as a late collection of poems in praise of the delights of human love; Esther and Jonah as imaginative stories from the Persian or Greek period, and Joel, Job and Proverbs as post-exilic compositions. Chronicles, Ezra and Nehemiah are all from the hand of the same priestly writer who freely molds the facts or invents new ones to suit his theories of religious development. It is safe to say that no competent body of

[5] *A History of the Literature of Ancient Israel, from the Earliest Times to 135 B. C.* By Henry Thatcher Fowler, Ph. D., Professor of Biblical Literature and History in Brown University. New York: Macmillan Co. $2.25.

scholarship to-day disputes these conclusions.

When one reads and studies the writings of the Hebrew prophets, poets and sages, under the guidance of these critical and comparative surveys, he must realize more completely the immense contribution the men of ancient Israel have made to the life and thought of the world. Viewed in the light of its historic origins, its worldwide relationships and its inherent worth, it is not too much to say with Professor Fowler that Israel's "literature is not only the deposit of milleniums of Semitic history, but something unique in itself—inadequately symbolized by the fine metal—rather the finest flowering of the whole Semitic race."

The Making of a Soul

The charm of *Queed* is present in the new novel by Henry Sydnor Harrison, and this young American has once again imagined and clothed in ready-made serge a hero quaint—unique even—and in some ways altogether detached from society in general. Dr. Vivian, the slum doctor of the tale *V. V.'s Eyes* (Houghton, $1.30), is in another sense very far from detached; for his faith in humanity is boundless, like his love of individuals; and one of the characters justly remarks, on page 505, "He believed in miracles, and so they were always happening to him." But one doesn't mind the fact that Mr. Harrison's story runs to more than 500 pages. One is under the spell of the kindliness of hero and author, too, and the fascination of the latter's sincere and often dramatic romance. For it *is* a romance, with an American Sir Willoughby, the fashion-plate hero, and Vivian as the real hero; and a heroine upon whose depiction Mr. Harrison has lavished great earnestness, preceded by remarkable observation and analysis, Carlisle Heth, beautiful daughter of ambitious parents, is a flesh-and-blood creation; and Dr. Vivian breathes into her (with Mr. Harrison's help) the one thing that she lacked for twenty-something years—a soul. And we are grateful for the Cooney family—Carlisle's poor but cheerful relations. We know them, oh, so well: and are better for the knowing.

There is, in compensation for the fact that there is rather less of humor than in the earlier volume, more seriousness of purpose. Not that the novelist is too serious. But whereas *Queed* was chiefly notable for its delightful echoing of life in old-fashioned Richmond, with many pleasing character studies and little absurdities of incident, the newer book is from cover to cover a drama of American society in the making and unmaking; of industrial evolution and pollution from high sources, and the complexity of the relations of our good instincts and bad. The personality of the Southern beauty who is, when all is said, the most solid figure here, develops, under the influence of the quixotic slum-doctor, far more plausibly than Queed's did under the charming guidance of Miss Charlie. And Mr. Harrison, for all his whimsicality, has firmly grasped a vital theme in the awakening of this "society girl" to newer ethics, finer aspirations. Some readers will be amazed that it has been possible for Mr. Harrison to make the record of social, civic and commercial life in a Southern town of these United States so palatable a fiction. The touch is light, in spite of the lavished care—the author is said to have worked over his manuscript during two long years; and one is thankful that the story of V. V. and Miss Carlisle Heth fell into Mr. Harrison's hands rather than into those of the late David Graham Phillips. Come to think it over, however, Mr. Phillips did try to tell this story, or one something like it. The plot is not a new discovery. But the tale is none the less fresh.

And we recommend it unreservedly. Even the sentimentalist attracted by the somewhat cheap title will not be wholly disappointed; in sentiment the novel is nowise wanting. But the lover of Meredith need not, on the other hand, fight shy of V. V. because of the sentimentalist's jostling presence. Mr. Harrison's novel is a distinguished achievement; its elements of tragic irony are nowise depressing. Rather is the story heartening and the moral sound. Reader, you will make no mistake in looking into *V. V.'s Eyes*, and looking steadily.

A Book on Stock Exchanges

The New York Stock Exchange and the trading in securities which is facilitated by it have been attacked recently by the Pujo committee of the national House and in various projects of legislation at Washington and Albany. *The Stock Exchange from Within* (Doubleday, Page & Co., $1.50), by William C. Van Antwerp, a New York broker and a member of the Exchange, is a defense and an explanation. He hopes, his preface says, that it may dull the sharp edge of misinformed criticism, and strengthen the hands and hearts of loyal friends of a greatly misunderstood institution. Mr. Van Antwerp was former-

ly a journalist. There is proof in his book that he has made himself familiar with the history of exchange trading, and has carefully studied the writings of economists, here and abroad, which relate to his subject.

In one chapter he sets out to answer the question whether such an institution as the New York Exchange is really needed and serves the public interest, or is merely a means for the promotion of gambling. The uses and abuses of speculation are considered in another. Here he explains why it is difficult to enforce the recommendation of the Hughes commission for an increase of the margins required on brokers' contracts with trading customers. What are called short sales, those made by traders who foresee or expect a decline of prices, are the subject of an interesting chapter, in which the steadying effect of such sales is pointed out. In this part of the book may be found a history of Germany's attempt to prevent such transactions by legislation. There has recently been a movement at Washington and in the New York Legislature for the compulsory incorporation of the Exchange. Mr. Van Antwerp summarizes the arguments against incorporation. They were presented a few months ago by the New York Merchants' Association and other organizations at Albany, where they prevented the passage of an incorporation bill.

It is shown that the Exchange has fought against what are called bucket shops. Since the book was published, Mr. Van Antwerp—as a member of a committee of the Exchange, we think—has made a tour of investigation and has reported the existence of many of these so-called "branch offices" of the Exchange in New York and other states. Recent prosecution by the national Government has not suppress them. He narrates the history of panics here and in Europe, and especially that of the American panic of 1907, showing what were, in his judgment, the causes of it, and earnestly opposing those who assert that this notable disturbance was manufactured by wicked financiers for their own profit.

For beginners in the broker's business, and for all who want to know how that business is done, there are full explanations. In the closing chapters are histories of the London Stock Exchange and the Paris Bourse. An appendix of thirty pages contains the entire report of the commission appointed by Governor Hughes (now a justice of the Supreme Court) in 1909, which devoted six months to a careful inquiry concerning the New York Exchange. It has been very difficult to obtain copies of this memorable and excellent report, and we are glad that it has been placed in this volume.

To those who know nothing about Mr. Van Antwerp it should be said that as a journalist he exhibited, in connection with anonymous writings that attracted much attention and were effective for reform, a profound dislike for unjust practices and for misconduct in the management of great corporations. We are confident that he is thoroly sincere in what he says in this book. It should be read by all in whose minds hostility to the New York Stock Exchange has been excited, and who desire to hear an intelligent and earnest defense. The author's numerous references make the work a guide to a library of authorities.

Literary Notes

Jerome D. Travers, amateur champion of the United States, 1907, 1908 and 1912, signs *Travers' Golf Book,* published with forty-eight illustrations by the Macmillan Company, $2. The illustrations from photographs and the occasional diagrams are of decided practical value and the exposition is quite simple enough for any one who has driven off a few times under the eyes of an initiate.

If Englishmen are the proverbial travelers it is true also that they are more leisurely in describing their travels and that their publishers put their travels up in thicker, more unwieldy volumes than publishers in other lands dare do. H. M. Tomlinson having spent part of two years aboard a tramp that steamed from Swansea to Para and up the Amazon and Madeira Rivers to the Barbados, Jamaica and Tampa, has told all about it in *The Sea and the Jungle* in some 350 pages, using a style much like that of other Englishmen we know. (Imported by Dutton, $2.50.)

In these days of arctic and antarctic exploration it is well to know something of the manner of life in regions where the only annoyance never afforded by travelers is that of heat. The brothers Leith—C. K. and A. T.—give a vivid and readable account of *A Summer and Winter on Hudson's Bay*—in summer by canoe and sail boat and in winter by dog sledge. The volume is without any literary art, but it has the air of actuality which comes of personal experience. There are pleasant glimpses in it of the Esquimaux and Indians of the Northern regions—very likeable people with many good qualities. The authors undertook the trip for scientific purposes, but its results from this point of view are only slightly indicated in their book (Madison, Wisconsin).

SURVEY of the WORLD

The Australian Capital Named

When we published, September 12, 1912, the story of the selection of a site for the capital of the Australian Commonwealth, the future city had not even a name and there was much discussion as to what it would be called. Some argued for a native name, such as Myola, meaning "a meeting-place." Others brought forward various local celebrities as worthy godfathers. The decision lay with the Federal Government and the secret was so well kept that there was great curiosity as to what name Lady Denman would find in the golden case handed her at the christening of the capital on March 12.

A strange group was that which stood on the pedestal of the monument marking the center of the city-to-be. Of the three men, the most conspicuous by reason of gold braid and cocked hat was "His Excellency the Right Honourable Sir Thomas Denman, Baron, P. C., C. C. M. C., K. C. V. O., Governor General and Commander-in-Chief of the Commonwealth of Australia," so his name reads on the cornerstone. But this inscription lies like an epitaph. It is a shame to play such a trick on the archeologists of the future. The men who really laid the stone and ruled the Commonwealth were the two who stood beside him: Andrew Fisher, Scotchman by birth and twenty years ago an engineer in a Queensland mining town, now Prime Minister, and King O'Malley, Canadian by birth, but hailing from California and Tasmania, now Minister for Home Affairs.

Just at noon Lady Denman opened the case and announced, "I name the capital of Australia Canberra."

So the Government, altho it represents the Labor party and is supposed to be radical if not revolutionary, fell back here upon solid British conservatism and decided to let well enough alone. Canberra is the name the place has borne ever since it was settled some fifty years ago. On the early papers it is spelled "Canbury," as if it were of English origin, altho there is an awful rumor afloat that it is an aboriginal word meaning "laughing jackass." Even if this is true it is not so bad as it seems, for the bird that goes by that name is a characteristic Australian species of kingfisher whose only fault is that it has too big a voice and uses it too much. The voice really would fit the emu better. To satisfy the refined taste of the younger generation of Australians an effort has been made to prove that the term is really derived from the French *jacasse*, a chatterbox. But the bird does not chatter; it undeniably brays and it may be presumed that the Australian pioneers knew more about jackasses than they did about French.

Having given the capital a name, the next step is to write poetry about it. No rime for Canberra has yet been discovered; but otherwise the Australian muse is doing her level best. A guinea prize, offered by the Sydney *Bulletin* for the best sonnet, brought out sixty entries, of which the following was adjudged the finest:

CANBERRA

(BY NINA MURDOCH)

She, who should bear her as a bounteous queen,
Like some poor suppliant beggar-maiden stands
Out on the barren plain, with empty hands;
No flashing jeweled stream with silver sheen
Girdles her waist, but in its stead a mean
Brown belt of stagnant waterholes. And lands
Far distant will make mock to see thick bands
Of dust, where a bright fillet should have been.

Haply the years with cunning fingers swift
Will weave this beggar maid a costly gown
Of borrowed splendor, and to deck her hair
Will bring a flashing diadem for gift.
Yet tho she wear fine raiment and a crown,
What power can make a barren woman bear?

This is not at all the proper spirit in which to hail the queen city of the Commonwealth. But most of the other poems are quite as pessimistic as to its prospects. Here is one that did not get any prize:

Hush-a-bye, dear Baby-town:
(Other towns must toil and play,
You can slumber day by day.)
Hid away from Fortune's frown,
And our foemen—white and brown,
(Who in search of spoil would stray,
Where a brooklet winds its way?)
Sleep well on your fern-clad down!

Hush, O dear one, do not cry
For more water. By-and-bye
You shall drink your little fill,
You shall have all gold can buy,
And as we each want supply,
We shall deem you dearer still.

Judging by the way she is being treated by her elder sisters, Cinderella would have been a more appropriate name than Canberra. But our Washington, of which we are now so proud, past thru the same pe-

riod of contempt. Perhaps, too, these poets all belong to the opposition party and the Labor poets are still to hear from.

EDWIN E. SLOSSON.

Competing Profitably with Silkworms

European manufacturers of artificial silk gained large profits in 1912, and the industry is growing. (Methods of artificial silk making were described in the Survey of the World for February 27, 1913.) The net earning of the Belgian company, at Tubize, were about $500,000. This company, which has branches in Hungary and Russia, recently expended $530,000 for improvements and extensions, and increased its daily output by 3300 pounds. The largest of all the companies, which is situated at Elberfeld, in Germany, had a net profit last year of $886,000, altho it is capitalized at only $1,200,000. Its dividend is to be increased from 36 to 40 per cent. The capital was doubled two years ago by a stock dividend. This company has a subsidiary corporation in France, which paid 22½ per cent, and another, paying 10 per cent, in Austria.

There are now in various parts of the world 33 companies making artificial silk by the viscose process, which is displacing other processes by lower cost of production. It is well protected by patents, the owners of which receive a royalty of about 50 cents a pound. A French company that uses it had a net profit last year of $316,600 on an output of 550,000 pounds. This company is enlarging its plant, intending to multiply its output by four, because, its officers say, the demand for its silk, to be used for wearing apparel, upholstery, curtains and hangings, is growing rapidly. Estimates of the cost of production (royalty included) by the three processes that have been used are as follows: Viscose, 65 cents a pound; cuproammonium, $1.05; Chardonnet, $1.31.

Violets as a Pest

A queer relationship of good and evil in plants has come to light in investigating the "red spider,"—that serious pest of cotton-culture in certain parts of the South. Nothing would seem more commendable in a village housewife than to make her dooryard pretty with borders and beds of violets; yet by doing so she runs a serious risk of destroying her husband's cotton crop, for these violets are probably the original source, and are now the chief sustaining agent, of the mite which spoils the cotton-plant with the "rust" which sometimes kills a whole field of it.

As soon as the infested cotton dies, or becomes untempting in the fall, the mites migrate to other plants, most of which fail the insects by dying in the early frosts. Upon two, however, they survive during the winter, to the mere cold of which they seem indifferent. One of these is the pokeweed, on the winter buds of whose fleshy roots they continue to feed. Most of the infection in fields remote from villages may be traced to a pokeweed, or a clump of it, whence the mites have traveled, after spring revival, multiplying rapidly as they advance. But violets seem to be their natural harbor, and, as these remain green all winter in the South, they can live upon them easily. Various remedies are recommended, but the principal one is either to dig up all the violets in the cotton country or else spray them with an insecticide. But who wants a bouquet of violets bedewed with Paris green or London purple?

The Martyrs of the Antarctic

Commander Evans, before the Royal Geographical Society at Albert Hall, told of his last parting from Captain Scott:

"On January 3 Captain Scott came into our tent and told us that he was sure he could reach the Pole if my party gave up one man and made the return journey shorthanded. On January 4 the last supporting party, consisting of Lashley, Crean, and myself, marched south to latitude 87.34 with the Polar party, and, seeing that they were traveling rapidly yet easily, we shook hands all around and said good-bye. Up to this time no traces of the successful Norwegians had been seen and we all fondly imagined that our flag would be the first to fly at the South Pole. We gave three cheers for the Southern party as they stepped off, and then turned our sledge and commenced our homeward march of nearly 800 miles. We frequently looked back until we saw the last of Captain Scott and his four companions, a tiny black spot on the horizon. Little did we think that our three cheers were the last appreciation they would ever know."

The Polar party covered the 145 geographical miles there remained in a fortnight, following the tracks of Amundsen's dogs from latitude 88. The Englishmen reached the pole January 17, 1912, fixing the spot by means of a four-inch theodolite. They differed from Amundsen's reckoning, as shown by his flag, by half a mile. And on the nineteenth they started homeward.

Their fatal progress is a part of history. After the death of Seaman Evans from severe concussion, the explorers pushed northward with pluck, but with diminishing energy. "Their best march on the barrier was only nine miles, and in the later stages their marches dropped to three miles. The

depots were 65 miles apart, and contained a week's provisions. They must have known that their slow progress was not good enough, but they could not increase their speed over such bad surfaces. The temperatures fell as they advanced instead of rising as expected. And we find them recording a temperature of minus 46.2 one night.

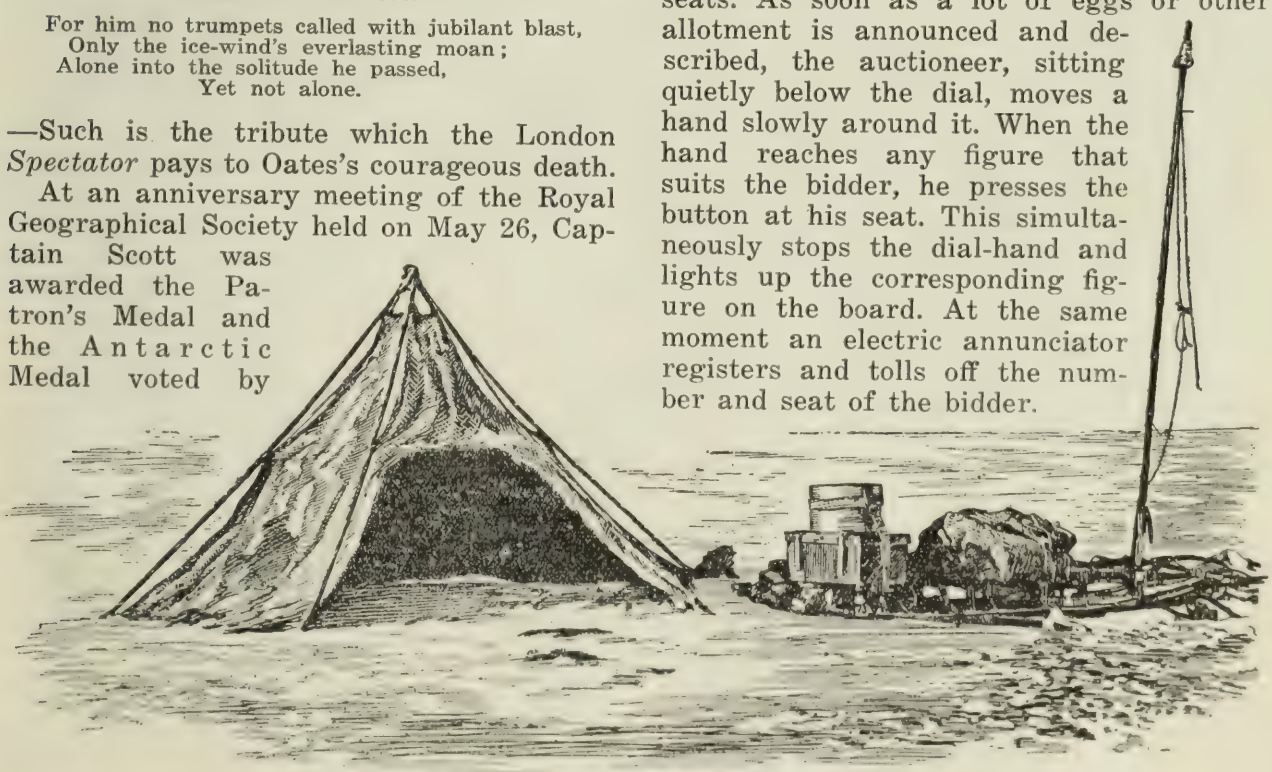
"Poor Oates's feet and hands were badly frost-bitten. He constantly appealed to Dr. Wilson for advice. 'What could he do?' Poor gallant soldier, we thought such worlds of him. Wilson could only answer, 'Slog on.' On March 17, which was Captain Oates's birthday, he walked out to his death in a gallant endeavor to save his comrades, and as our dead leader wrote, 'It was the act of a brave man and an English gentleman.' He always lived as he died, a magnificent man.

"Scott, Wilson and Bowers fought on until March 21, only doing about 20 miles in four days, and then they were forced to camp 11 miles south of One Ton Depot. They were kept here by a blizzard which was too violent to permit them to move, and on March 25 Captain Scott wrote that message to the public: 'Had we lived, I should have had a tale to tell of the hardihood, endurance, and courage of my companions which would have stirred the hearts of Englishmen. *These rough notes and our dead bodies must tell the tale.*'"

It was not in the fury and the foam,
The swift, earth-shaking tumult, and the shout
Of close-knit squadrons riding hard and home,
That he went out.

For him no trumpets called with jubilant blast,
Only the ice-wind's everlasting moan;
Alone into the solitude he passed,
Yet not alone.

—Such is the tribute which the London *Spectator* pays to Oates's courageous death.



At an anniversary meeting of the Royal Geographical Society held on May 26, Captain Scott was awarded the Patron's Medal and the Antarctic Medal voted by the Society in 1904. Lady Scott was presented with a silver casket in which to keep these awards. She will herself design a bronze statue, to be erected at Cheltenham by public subscription, to Dr. Wilson, the scientist who accompanied her husband to the pole. Lord Curzon, President of the Royal Society, said that Scott's dash to the Pole was, in its fatality, a great drama. No attempt will be made to disturb the bodies of the heroes. The British Museum will publish the scientific notes of the expedition.

Electric Auction Sales

In order to do away with the immense amount of noise, disorder and confusion that accompany auction sales, a Holland inventor has devised an electric method which is so successful that such sales in The Hague and other cities are now conducted in silence and comfort.

The customary selling of eggs by auction that prevails in Holland is usually a weekly affair in the Dutch agricultural centers. The eggs are auctioned off in 2500 lots. With this new plan each bidder sits in a numbered seat and is given a push button connected with a large dial.

The auctioneer is stationed in front of this large dial, upon which are prices ranging from the lowest to the highest. There is also a large wall board which contains a similar set of numbers which can be electrically lighted, also connected with the seats. As soon as a lot of eggs or other allotment is announced and described, the auctioneer, sitting quietly below the dial, moves a hand slowly around it. When the hand reaches any figure that suits the bidder, he presses the button at his seat. This simultaneously stops the dial-hand and lights up the corresponding figure on the board. At the same moment an electric annunciator registers and tolls off the number and seat of the bidder.

THE TENT IN WHICH CAPTAIN SCOTT DIED

From a photograph in the London *Daily Mirror* taken by the search party after the snow had been cleared away. When the tent was first sighted on November 10, 1912, snow covered all but the peak.

Then the auctioneer slowly and deliberately resumes his methodical twisting of the dial-hand. As it revolves the next bidder can register a higher bid, and so on until the auction sale is over.

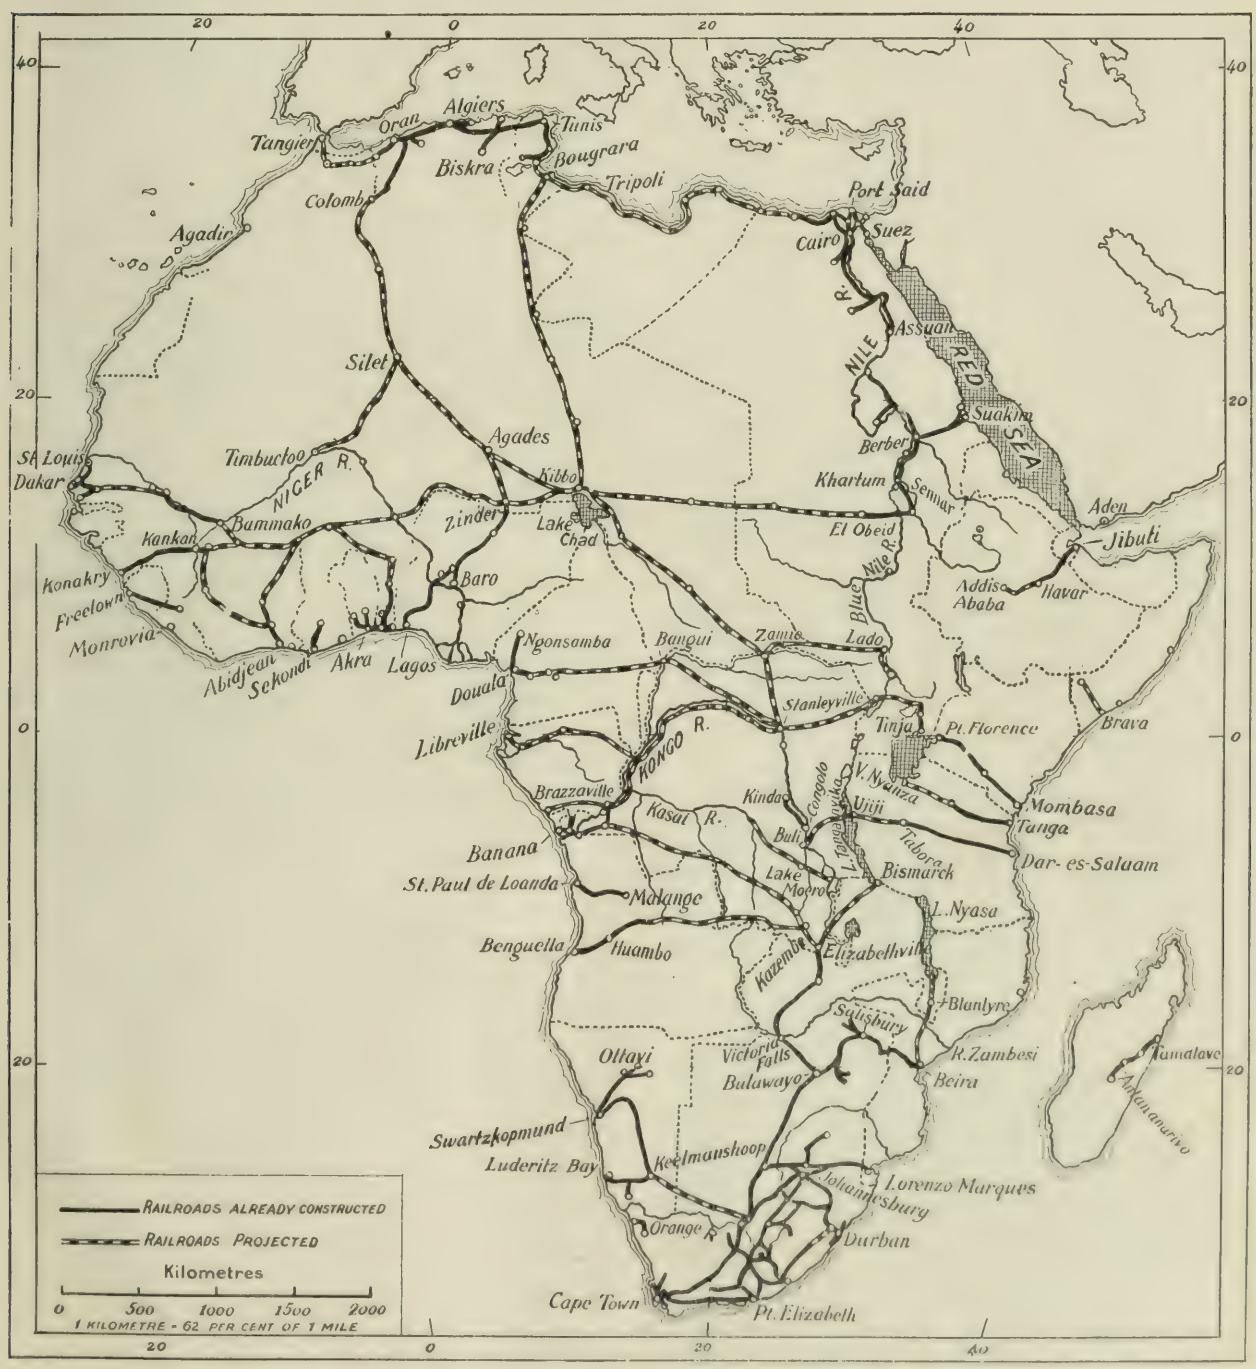
Railway Plans and Progress in Africa

Altho a few miles of rails were laid in Africa before 1880, nearly all the work which this map shows by its solid lines has been accomplished since that date, chiefly within the present century. Egypt has now 2500 miles of railroad, Algeria-Tunis 3125 miles and South Africa almost 12,000 miles. To connect these two poles of population and business, the "Cape-to-Cairo line," a combination of railways with navigation of lakes and rivers along the great depression in east central Africa, lacks only some 900 miles of being continuous.

Two other north-and-south lines have been sketched and in part constructed. One, the westernmost, is Berthelot's projection across the Sahara to Lake Chad, by way of Timbuctu, of the Algerian line from Oran now resting at Colomb. To the fertile and populous shore of this great central lake of the Sudan is directed also a second trans-Saharan line, known as Bonsard's, from Tripoli thru the oases along the ancient caravan trail. This will be the shorter of the two, and give the most direct route to the upper Kongo region, while the Berthelot line will afford a northern outlet to the various roads striking inland thru Senegambia and Nigeria, where civilization is extending rapidly under neighborly French and English control and energy.

From Lake Chad a line is projected southward to the Kongo at Stanleyville, crossing the great Ubangi River near the head of navigation, and making accessible a healthful, populous, and resourceful district. From Stanleyville, the central point of transportation and commerce in the Kongo Free State, where the river makes its great bend from north to west, it will soon be possible to go by steamboat or train to any part of South or East Afrcia. The distance by rail between the Mediterranean and Stanleyville will be about 3750 miles. This railway to Lake Chad and across the Sahara would open to traffic the forests, cattle ranges and fertile uplands of the Belgian interior, now restricted to the uncertain movements of the river-boats; and compartively short additions southward (likely, indeed, to be made first) would connect it with Lake Tanganyika and the growing transportation system of Rhodesia.

Several east-and-west transcontinental routes have been begun. One plan is to complete a coast line from Tangier to Port Said, a third of which already exists. It would connect all the Mediterranean seaports and make available broad tracts of farming-land now useless because too far from the infrequent ports; and it would stimulate industry and trade in many secluded oases.



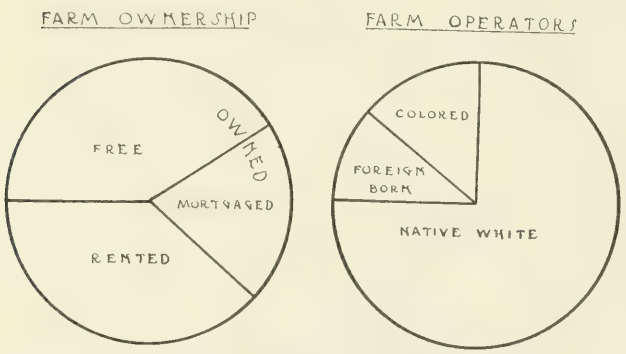
A Sudanese transcontinental line will certainly be constructed soon, which will connect the various railroads pushing inland from the Atlantic ports between Dakar and Lagos, and carry their traffic to and from Suakim on the Red Sea. Its greatest length would be about 4500 miles. No serious obstacles would be encountered by the engineers anywhere along the line, since there are no mountains to be surmounted, and the grades would be light. Hence it ought to be able to make rates upon freight so low that it would become a profitable route for shipments between the Orient and North or South America. One-fifth of this lay-out is now in operation, reaching westward via Sennar to El Obeid, between which and Kibbo, on Lake Chad, lies the thickly populated, arable and pastoral region of the Egyptian Sudan, and eastward from the coast to the northern border of Nigeria.

A third cross-country route will continue the British line from Mombasa to Victoria Nyanza, and from that lake across Uganda, one of the most promising parts of British East Africa, over the foothills of Mt. Ruwenzori and down-stream, thru valuable forests, to Stanleyville. This route will open a region of probable mineral as well as known woodland wealth, and will be extremely picturesque and attractive to tourists and sportsmen. It is further proposed to build a line from Stanleyville down the Kongo to meet the existing rails from Banana to Brazzaville, with a branch passing over to the Gaboon valley and down it to Libreville. It is also proposed to run a line from Stanleyville over to and across the Ubangi Valley, and thence across the French Kongo to Duala, the port of Kamerun. It seems probable that this equatorial transcontinental railway will be the first to be realized. The great need and its comparative shortness (altho in places it will be difficult to build) favor its early completion along one or both of its western extensions.

Reference to the map will show how greatly these lines and their feeders will, when constructed, shorten journeys and haulage from one part of the continent to another, or to Europe, as compared with the present round-about means of travel;

and any one familiar with the geography and resources of the southern half of Africa will appreciate what a wealth of opportunity and of material will be made available by their construction and "linking up." A single short but important link, now in preparation, is an illustration.

Nyasaland is a district west and south of Lake Nyasa, settled by British immigrants who cultivate cotton, tobacco, coffee, and other crops. For some years they have had a railroad from their principal town, Blantyre, to the navigable part of the Shire River, by which the overflow of the lake reaches the Zambesi. The colony soon came to the limit of its progress, however, because its products had to go out first by rail to Port Herald, then by barge down the Shire to Kaia, then by boat down the main river to Chinde, and finally in lighters or small freight carriers to Beira, before really starting on their voyage to a European market. Machinery and other supplies came in by the same slow and costly method; and the worst of it is that annually the water is so low in the Shire that



RAILROADS INVADING THE AFRICAN HINTERLAND

Note the three projected transcontinental systems, one along the Barbary coast from Tangier to Port Said, one across the Sudan from various Atlantic terminals to Suakim on the Red Sea, and one under the equator from Libreville and Banana to Mombasa. Stanleyville will be the railway center of central Africa. In South Africa, the only important link yet to be built is that connecting the German road at Keelmanshoop with the English system.

for many weeks at a time boats cannot pass up or down at all. Now a railway is about to be built from Beira directly into Nyasaland, and this productive colony will at once resume its prosperity and progress.

Farm Ownership

Of the 6,361,502 farms in the United States in 1910, about five-eighths were operated by owners and three-eighths by tenants. The small remainder, amounting to less than one per cent, were operated by

WHAT THE FARM CENSUS SHOWS

hired managers. In New England a larger proportion of farms were operated by owners than in any other section of the country, while in the Southern states about helf of the farms were rented. The average number of acres in farms operated by the owners is 151.6 and in farms operated by tenants, 96.2. In both cases there has been practically no change in size since 1900.

Of the farms which were owned by the operator almost exactly two-thirds were free from mortgage and one-third were mortgaged. The proportion of farms owned free from mortgage is higher in the Southern than in the Northern states. The average value of the farms operated by their owners in this country is $6289, while the average size of the mortgage is $1715. The indebtedness is therefore 27.3 per cent of the value.

Ninety-five per cent of the farm operators of the United States are native whites, 10.5 per cent are foreign-born whites and 14.5 per cent colored. The percentage of farm owners is somewhat different. Among this class 80.1 per cent are native whites, 13.8 per cent foreign-born whites and 6.1 per cent are colored. Of farm tenants 66.2 per cent are native whites, 5.0 per cent foreign-born whites and 28.8 per cent colored. This brings out the interesting comparison that there are more than twice as many farms owned by foreign-born whites as by colored, while more than five times as many farms are rented by colored as by foreign-born whites. The number of negro farmers has increased more rapidly during the past decade than that of white farmers.

It may be of interest at the present time to know that in 1910 there were 2215 farm operators who were Japanese, while in 1900 their number had been 39. Among the Chinese the number of farm operators has decreased from 938 in 1900 to 636 in 1910. Considerably more than half of the foreign-born farm operators in the United States came from Germany and the Scandinavian countries. Altho 14 per cent of the foreign-born whites in the United States in 1910 were born in Ireland, only 5 per cent of the foreign-born farm operators were from that country.

WILLIAM B. BAILEY

Assistant Professor of Political Economy, Yale University.

A Mysterious Gas

X_3 it is provisionally called by its discoverer, Sir J. J. Thomson, of Cambridge University. This is in accordance with the definition given by a high-school girl in her algebra examination. In reply to the question "What is the meaning of X?" she answered, quite correctly, "X is something you use when you don't know what you are talking about." Well, Professor Thomson does not know what he is talking about. He only knows that he has got a gas that does not correspond to anything hitherto described.

He gets it by the same means as Roentgen got his x-rays, that is, by the action of the kathode rays. The kathode rays consist of a stream of negatively electrified corpuscles in a tube almost completely exhausted of its gas. When they strike against the glass on the other side of the tube there they start up the x-rays by which we can see the shadow of our bones. But if the kathode rays are focussed on a little piece of metal the bombardment of this by the innumerable corpuscles moving with almost the velocity of light, heats it to the melting point and drives out of the metal all of the occluded gases such as hydrogen and carbon dioxid. Among them comes the mysterious stranger, a stable gas which may be preserved in a glass tube and has an atomic weight of 3. The atomic weight Professor Thomson determines by an ingenious method of his own, the most delicate process of analysis known to man; for every element and compound in a mixture of gases, too small to be seen or weighed, records its weight and electric charge upon a photographic plate. Those interested will find it described in *Nature* of May 29.

This unknown gas, X_3, might be thought a form of hydrogen, that is, H_3 instead of ordinary hydrogen which has two atoms to the molecule and is represented by H_2. Thus we have ozone, O_3, as well as oxygen, O_2. But ozone is a much more active gas than ordinary oxygen and so we should expect that H_3 would be less stable than ordinary hydrogen. On the contrary, X_3 is so stable that it will not combine with oxygen as hydrogen does to form water. The Russian chemist Mendeléef, thirty years ago, conducted a scheme, the periodic law, which was designed to include all possible elements, not only those that were then known but all that might be discovered in the future. He provided a pigeon-hole for an element with an atomic weight of three but prophesied that it would be still more active than fluorin. It would then be such an energetic element that it would eat its way out of a glass tube like a rat out of a wooden trap. But X_3 does not show any such active disposition.

We might even go so far as to imagine that the new gas was manufactured out of the metal by the bombardment of the electrified corpuscles, for recent investigations have got us accustomed to the idea of the transmutation of elements. But Professor Thomson has found that the gas is not given off from new-made metals at all. He obtained the largest amount of X_3 from a piece of lead from the roof of Trinity College Chapel, several hundred years old. On the other hand, lead freshly precipitated from a lead acetate solution produced no X_3 when subjected to the action of the kathode rays. So the new element or compound must for the present be symbolized by X_3, meaning in this case not a superior quality, as in the case of cloth or ale, but a triple mystery.

The Stefansson Expedition

"The sensational aspect of the Canadian arctic expedition is that, if it should prove as successful as it conceivably may, it will close forever the chapter of geographical discovery, for the only place on the whole earth where there can possibly be land of any considerable extent the very existence of which is unknown to us is the unexplored area of a million or so square miles that is represented by white patches on our map, lying between Alaska and the north pole."

So writes Vilhjálmar Stefánsson, in the New York *Times*, of the expedition which the Canadian government is sending under his direction to spend three winters and four summers in scientific observation and exploration in the Arctic.

The steam whaler "Karluk" put out from Victoria, B. C., on June 17, in charge of Capt. Robert Bartlett, who sailed the "Roosevelt" for Peary. On board were most of the big party of fifteen scientists who compose the working staff; Mr. Stefánsson and the remaining members will join them at Nome on July 8.

All sorts of investigations are on the program. The anthropologists, among whom Mr. Stefánsson himself is numbered, will study the archeology and ethnology of the Eskimo; their special problem will be to determine the present and former limits of human occupation. In the summer they will hunt for the remains of Eskimo villages. The "blond Eskimos" discovered by Mr. Stefánsson on his last expedition will be carefully studied and perhaps caught in moving pictures for all the world to see. But nobody will try to "civilize" them: Mr. Stefánsson wrote in THE INDEPENDENT for December 28, 1911, just what he thought of such attempts. ("The Indian and Civilization.")

Then the geology and zoology of the whole region from Alaska to Coronation Gulf is to be worked over, and specimens secured; and the geographers will map unexplored coasts and plot the continental shelf by soundings.

There may be available trade routes between the islands off the coast, and copper and other metals in them: the expedition will look for both. But the most alluring possibility is that this uncharted stretch of Arctic sea may yield new and unknown lands, even in sophisticated 1913.

VILHJALMAR STEFANSSON

—Leo Cheney, in *Punch.*

MILITANT SUFFRAGIST (after long and futile efforts to light a fire for her tea-kettle). "And to think that only yesterday I burnt two pavilions and a church."

Fifty Years Ago

From **The Independent,** June 25, 1863.

Prof. Wolcott Gibbs, an able chemist, has been chosen Rumford Professor at Harvard University. Columbia College a year or two since refused to appoint him to a chemical professorship. Because he did not understand chemistry? No; because he was a Unitarian! This is as if you should refuse to get your clothes of the best tailor because he did not make jack knives to suit you.

Mr. Cyrus W. Field has gone to England in furtherance of his favorite Atlantic Telegraph enterprise. Both ends of the proposed telegraph line are to be under the control of England. No American is a real friend of his country who will give a cent to help England at present to such a tremendous military engine as that.

Poster—"Only a fence."—*Stanford Chaparral.*

THE WEEK

The Tariff Bill

The Senate committee completed its work on the House tariff bill, and it was laid before the Democratic caucus. There is a long list of changes. Nearly all of these are reductions. They will reduce the estimated revenue by about $5,000,000, but a new tax on brandy used in fortifying wines will add $7,000,000, and one of 5 cents a bunch on bananas may yield $2,000,000. The House bill's provisions concerning wool and sugar were not materially changed.

That part of the bill which imposes an income tax was modified by lowering the exemption limit from $4000 to $3000, for unmarried persons. It is proposed that, for married persons, there shall be an addition of $1000 for a dependent wife or husband, and one of $500 for a dependent child, but only two such children are to be taken into account. Senator Hitchcock asked the committee to attach an amendment embodying Attorney-General McReynolds's project for a graduated tax on corporations and manufacturers engaged in the tobacco business, but the amendment was rejected. Parts of the administrative sections which offended foreign manufacturers and exporters have been excluded or improved. The proposed reduction of 5 per cent on goods imported in American ships was cut out.

In the lobby investigation there has been much testimony as to work done and money expended in relation to sugar duties, the beet sugar industry striving to preserve the duty, and certain refiners seeking the removal of it. Many letters were produced and read. But nearly all of this testimony related to what was done in past years. Some of the letters, for example, were written in 1907, 1908 or 1909. Large sums were expended, mainly in publicity projects, and there was a movement for the purchase of a Chicago newspaper. The same committee will inquire as to a statement recently made by Robert S. Lovett, chairman of the Union Pacific Railroad Company, that he was approached by persons claiming to be able to exert influence in Congress and in the Department of Justice in connection with the suit which involves a dissolution of the Union Pacific and Southern Pacific combination.

Washington Notes

John L. McNab, Federal District Attorney at San Francisco, resigned last week and at the same time complained in a long and bitter dispatch to the President that he had been driven to do this because the Attorney-General, against his protest, had ordered a postponement of the trial of M. I. Diggs and Andrew Caminetti, indicted under the White Slave act. Caminetti is a son of State Senator Caminetti, recently appointed Commissioner of Immigration. Friends of the defendants had been boasting that the District Attorney would be restrained by political influence. It appears that the postponement was ordered at the request of Secretary Wilson. The elder Caminetti wanted to be present at the trial of his son, but the Secretary desired him to remain in Washington for the present. Therefore he asked for the postponement.

Among the nominations made last week were the following: Thomas Nelson Page, of Virginia, Ambassador to Italy; Dr. Henry Van Dyke, of New Jersey, Minister to the Netherlands; Meredith Nicholson, of Indiana, Minister to Portugal; Pleasant A. Stovall, of Georgia, Minister to Switzerland; John B. O'Rear, of Missouri, Minister to Bolivia; Thomas Ewing, Jr., of New York, Commissioner of Patents. The Ambassadorship at Vienna has been offered to Maurice F. Egan, now Minister to Denmark.

Trust Questions

It was understood at Washington last week that the President would sign the Sundry Civil Appropriation bill, which has a paragraph providing that no part of the money assigned to the Department of Justice shall be expended in prosecuting combinations of farmers or workingmen for violation of the Anti-Trust law. He was intending, however, to attach an explanatory memorandum, expressing his disapproval of this exemption (on account of which the same bill was vetoed by Mr. Taft) and pointing out that there are other funds controlled by the Department which can be used, if needed, in the prosecution of such offenders. The bill carries appropriations amounting to $118,000,000, for the

fiscal year which will end on the 30th inst., and, it was said, he did not feel that he would be justified in causing the failure of it. He has received from organizations and individuals hundreds of protests against approval of the bill.

For some months past the agents of the Department of Justice have been inquiring concerning the National Wholesale Jewelers' Association. Witnesses testified before a grand jury in New York, last week, where indictments for violation of the Sherman act are sought. The Keystone Watch Case Company is striving to reach a settlement with the Government in the pending suit (under the Sherman act) for a dissolution of that corporation.

Panama

Water was admitted at the Gatun locks for the first time on the 14th, to test the valves. The result was satisfactory. The engineers are considering the expediency of washing away the hills that overlook the Culebra cut by hydraulic mining machinery, to relieve the pressure which causes slides there.

It will be necessary in the near future to provide for the passage of railway trains across the Canal route. The construction of bridges high enough to avoid contact with the masts of ships is said to be out of the question, and tunnels would cost too much. It is expected, therefore, that cars will be carried on large floats or barges propelled by steam.

It is said at Washington that the arbitration treaties will not be renewed by the Senate in their present form. Senators Chamberlain and O'Gorman have been urged to withdraw their opposition, but in vain. They will insist, it is reported, that if the treaty with Great Britain be renewed, a clause shall be inserted expressly providing that the exemption of our coastwise shipping from the payment of canal tolls shall not be submitted to arbitration.

The Philippine Islands

At the end of four days of fighting, on the island of Jolo, the rebellious Moros were subdued and dispersed. Fourteen men on the American side were killed, and twenty-five wounded. Eleven of those who lost their lives were soldiers in companies of the Philippine Scouts and two were privates in the regular army. The fourteenth was Captain Taylor A. Nichols. In a report to the War Department Governor General Forbes says that General Pershing exhausted all the virtues of patience before attacking the rebels, and that the punishment of them was required in the interest of good government.

A son of Emilio Aguinaldo, the revolutionary leader, arrived at Kobe last week, and proceeded to Tokio. He went to Japan secretly, the dispatches say, and in Japanese dress. It is reported that he seeks to make some use of our dispute with Japan, having in mind the independence of the Philippines. The elder Aguinaldo, however, has been living quietly on his farm, and Delegate Quezon says he is taking no part in any movement against American rule. The Delegate also said that his people looked to the United States for their independence, and preferred the rule of the United States to that of any other foreign Power. "If independence should be granted to them," he added, "and if you should afterward have war with the Far East, you will find the Filipinos fighting for you and your flag."

The death rate in Manila has recently been the lowest on record, owing, it is thought, to improved water supply, the new sewer system and modern sanitary regulations. Since January 1 there have been eight cases of bubonic plague and seven deaths.

Mexico

Reports from Mexico show that the rebels are still gaining. When the capital of Zacatecas was taken, some time ago, a majority of the 200 Federal soldiers there were killed. Forced loans were obtained from citizens by the victors. Those who refused to pay were killed. The city has since been evacuated. At Jerez, also in Zacatecas, the rebels proclaimed Paulino Martinez provisional President. He is the publisher of a Mexican paper in El Paso. The capture of Matamoras, which is near Brownsville, Tex., was followed by an attempt to bribe the rebel commander there, General Blanco. He says that an emissary from Huerta offered him $300,000 if he would join the Government's forces. The emissary was put to death. In the South there are states that desire to set up an independent government, and others whose people talk of seeking annexation to Guatemala. The Governor of Campeche has revolted with 800 men. There has been hard fighting in Sonora, north of Guaymas. Didier Masson, the French aviator, past over the Federal trenches at Ortiz in his aeroplane, dropping bombs, and thus killed, it is said, fifty-two men. Federal victories in Nuevo Leon and Tamaulipas have been reported at the capital.

At the suggestion of Felix Diaz, his compact with Huerta, allowing him to name

half the members of the Cabinet, was annulled. General Mondragon, Minister of War, and three other Ministers at once retired from office. Mondragon's successor is General Blanquet. Huerta is now in full control. There is much testimony as to a growth of anti-American sentiment. This is due to President Wilson's failure to recognize Huerta's Government. Many Americans are leaving the country. Others are appealing to Washington for protection. From one end to the other, the condition of the country is deplorable. Our Government's policy has not been changed. Huerta is not regarded as a constitutional President and therefore his Government will not be formally recognized. President Wilson waits for the election in October and the restoration of peace.

Cuba

The Cuban House was left without a quorum, last week, owing to the withdrawal of Conservatives, because of the Liberals' refusal to comply with President Menocal's request for a postponement of the debate on a bill authorizing him to provide for arbitration of the English, French and German claims for damages suffered during the revolution. He opposes the bill. His enemies say his opposition is due to a desire to prevent the flotation in London of bonds in support of a projected railroad, for which a concession was granted by President Gomez to the latter's friends, the head of the present Cabinet having formerly been counsel for a railroad company that is striving to prevent the construction of the proposed road.

It is expected that the sugar crop will be 2,200,000 tons. There was a record of 2,066,845 tons up to June 1, against 1,662,798 tons on the same date last year.

President Menocal has revoked the Gomez concession to the Port Improvement Company, a corporation which was to improve several harbors and to be paid in part by taxes on imports.

South America

In Argentina, the Anglo-Argentine beef companies decided, on the 16th, to reduce prices by 25 per cent to meet the competition of the American companies in the London market. Five days later nearly all of them gave notice that their plants were to be closed. Representatives of the Armour and Swift interests denied that there had been any attempt to make a monopoly or that Trust methods had been used by them. In the London House of Commons, last week, the British Government declined to send a special commissioner to Argentina, to make inquiry about the beef business. It was said, however, that the Government was carefully watching the situation.

A delegation from the Boston Chamber of Commerce was entertained last week in Buenos Ayres. In Rio de Janeiro the visitors were guests of the Government. Dr. Lauro Muller, Brazil's Minister of Foreign Affairs, came from Washington to New York, last week, and was the guest of honor at several dinners. At one his hosts were 200 exporting manufacturers, who gave him a gold cup. He attended another, to which he was invited by 200 members of the Chamber of Commerce. One of the speakers was Senator Root, who said that the maintenance of peace was sometimes endangered by the failure of a people to observe the rules of international courtesy. "We must learn civility," said he; "we must learn that a policy of peace cannot be sustained by insults." Dr. Muller visited West Point and then went to Chicago, where he was very hospitably entertained.

In England

The Marconi debate in the House of Commons closed on the 19th. Lord-Chancellor Lloyd-George and Attorney-General Sir Rufus Isaacs were vindicated by a vote of 346 to 268 on a Liberal amendment to a motion on the subject of the ministers investments in wireless. Before the vote was taken the Prime Minister made a speech deploring the partisan calumnies which have marked this episode, and the "disgraceful appeals to racial and religious animosities." "The ministers have admitted their error," Mr. Asquith reminded the House, "but their honor is unstained." The reference to their admission applies to speeches which Sir Rufus and Mr. Lloyd-George made on the 18th. Sir Rufus Isaacs confessed that his failure to disclose all the facts in the case in the course of the debate last October was now proved a mistake. Mr. Asquith, in his speech, paid a tribute to the zeal and integrity of Lord Murray of Elibank, the former chief whip, associated with Isaacs and Lloyd-George in the Marconi speculations.

Militant suffragets have mutilated some 300 volumes in the library of St. John's College, Cambridge, and destroyed the east wing of the Gatty Marine Laboratory, at St. Andrew's University, Scotland; also a part of the Church of St. John at Southend, England. These crimes were committed last week. The prison authorities released, on the 21st, owing to ill-health resulting from a hunger strike, Laura Ger-

aldine Lennox, formerly sub-editor of the *Suffragette*. The woman was sentenced to six months' penal servitude on June 17. Three other militants were released the same day, for the same reason. It is said that Mrs. Pankhurst, who was recently released again, can swallow no food owing to her serious condition. Judgments against the Pankhursts and Pethick Lawrences granted tradesmen whose windows have been smashed amount to $7000.

At a race-meeting at Ascot on June 19 Harold Hewitt, an Englishman aged forty years, and said to be a sufferer from religious mania, rushed on the track, waving a flag and flourishing a revolver at one of the jockeys. The madman did not injure the rider, who was jockey for August Belmont, a New Yorker, but he himself received a kick in the head from which he is likely to die. There is no evidence that Hewitt was interested in the suffrage movement.

On June 11 Mr. Asquith's speech on the Finance bill in the House of Commons was interrupted when a bag of flour was hurled at him from the Strangers' Gallery. Pamphlets followed. The manifestant uttered cries of "Remember Miss Davison!" Mr. Asquith was unhurt, and quite cool; a male suffragist was the perpetrator of the incident.

On the evening of the same day the Premier, in refusing a demand of the Laborite members for the abolition of the taxes on food and the substitution of taxes on unearned incomes and large estates, delivered a lecture to the Laborites on the duty of workers to bear a fair share of the country's expenses. He contended that the workingmen benefited by the army, the navy, the civil service and other Government departments as much as any other classes. He added:

"I do not think that there is any doctrine more fatal to the root of the principle of finance than that a democratic government should be concerned with the constant amelioration, at great expense to the community, of the social conditions of the less favored classes of the country at the cost of other classes."

The French Army

On June 16, the general debate on the French army bill was closed, the vote being 435 to 125. A motion to postpone discussion of the articles in the bill till after the general election was voted down, 149 to 412. Socialist orators maintained that the Government was anxious to increase the length of service in view of the occupation of Morocco, or owing to an agreement with Russia concluded last summer. Premier Barthou denied both statements. M. Etienne, the Minister of War, again explained that the Government, on learning that the German army was about to be increased from 700,000 to 870,000 men, was compelled to take the present step. On June 18, M. Jaurès, the Socialist leader, addrest the Chamber for two hours, attacking the new three-year service bill, and urging the abandonment of the regular army and the establishment of a national militia.

Heavy sentences were past on June 21 on the mutineers who took part in the demonstration at Rodez against the plan to extend the period of army service to three years. The demonstration at Rodez was more serious than at other places. It was quelled only by Major Angelby seizing a rifle and threatening to shoot the first man who left the barracks. Three of the soldiers were condemned by the court martial to five years' imprisonment, one to four years, three to three years, one to two years, two to one year, one to six months and two to four months.

Syndicalist agitation is held responsible for the anti-military campaign in France, and the Premier told the Senate, on May 28, that the General Confederation of Labor was illegal in its actions, and that if the Government's investigations into army troubles did not supply sufficient evidence in that regard the Ministry would demand fuller powers to deal with the Confederation.

Various Items

M. Poincaré, President of the French republic, following the example of his predecessors since the establishment of the "cordial understanding" between Great Britain and France, has planned a visit to England and was to have reached Spithead June 24 on board the battleship *Courbet*. The President was to be accompanied by M. Pichon, Minister for Foreign Affairs, and other officials, and his British visit was to continue until June 27. A large fleet of British war vessels was ordered to receive the President at Spithead and to fire a royal salute. At Portsmouth the Prince of Wales and the Duke of Connaught, Governor-General of Canada, were to receive the President and conduct his party to London. The French parliament has voted $57,000 for the President's traveling expenses.

The renewal of fighting in Morocco which resulted in violent rioting at Barcelona in 1909 is again arousing socialistic and anarchistic demonstrations in northern Spain.

Twenty men accused of complicity in the assassination of the Turkish Grand Vizier Mahmud Skevket Pasha, were sentenced

to death on the 22d after trial by court martial and were executed on the 23d.

The members of the new radical cabinet that took office at Copenhagen on the 21st refused to wear uniforms or decorations or to accept the title "excellency." The wife of the Premier, M. Zahle, who is a lawyer, is an official parliamentary shorthand writer and intends to continue her work, for which she is paid a salary of $825. While her husband is Premier she will present this amount to the shorthand writers' fund.

The adoption of an electoral reform bill whose provisions conflict with those of the measure sent up by the Chamber of Deputies is the French Senate's contribution to the Government budget of difficulties. A joint committee of the Houses to reconcile the divergences of the two bills is the most likely expedient.

The Constitutional Committee of the Storthing has decided unanimously to introduce a bill bestowing the franchise upon Danish women for all elections. The Radical majority in the Storthing assures the passage of the bill.

Women in Denmark, by a bill past in 1907, already enjoy the franchise to the extent that those who have paid their taxes for the year preceding, or whose husbands have paid for them, are qualified to vote at any election. This enactment added about 300,000 to the electorate. Women may also be elected to the Storthing, and may fill most public offices except those in the government, church, army and navy.

Italian Notes

In a battle at Attangi (Ettangi) on the 19th one Italian officer and nineteen soldiers were killed, and more than 200 wounded. The Tripolitan Arabs who effected these losses were, however, routed.

In spite of Socialist opposition, the Italian Parliament has voted $20,000,000 for the occupation of Tripoli and Cyrenaica. Most of the 80,000 men now in Libya, as Italy has renamed the country, are concentrated in Cyrenaica and are preparing for a vast sweeping movement. The occupation of Libya is still costing the country $200,000 a day, but the war enthusiasm is not dead.

Replying to a proposition made by twenty-five Deputies that women be allowed to vote at municipal elections, the Premier repeated his contention that owing to the low level of education among women in Italy the question of woman suffrage was premature. He added that the matter would better be left in abeyance until the next general election, when Parliament will represent 8,000,000 instead of 5,000,000 voters.

The Balkan Savages

News from the Balkans is bellicose. The latest Bulgarian reply to Servia's note demanding a revision of the treaty between these countries is tantamount to a refusal to do so. An attack by the Bulgars on the Servians and Greeks on the River Vardar in Macedonia is reported to be imminent. The coöperation of the Greeks and Serbs has been effected, and three brigades of Montenegrin infantry are advancing thru Macedonia to join the Serbs at the front.

Bulgaria, in a note sent to Greece, has assumed the same attitude as that adopted toward Servia. She declines to cease the concentration of her troops on the Greek lines or to demobilize her forces unless Greece consents to a joint occupation of the disputed territory. According to reports current at Salonika Bulgaria will require another ten days to complete the concentration of her forces against Servia and Greece. Skirmishes between the opposing armies are reported. Bulgaria has, according to an Austrian despatch, definitely declined the Russian Emperor's invitation for a meeting of the Balkan premiers at St. Petersburg.

The Servian Government is said to have decided to inform Russia that. in view of the Bulgarian attitude as regards the concentration of troops in Macedonia, and on other points, a meeting of the Balkan premiers at St. Petersburg would be futile. Count Tisza, the Hungarian Premier, made a speech in the Hungarian Chamber on the 19th in which he exprest his fear for the independence of the Balkan states, and insisted on the right of the latter to settle their differences as they chose, either by war, mediation or arbitration. Their decision, said Count Tisza, must be perfectly free or otherwise the solution of the difficulty would amount to intervention. "Such a solution," he went on, "we could not accept. We will not allow any Power to obtain special privileges in the Balkans."

It was announced at Paris on the 19th that the Foreign Office had given leading French bankers to understand that the Government would strongly disapprove of any loan being made to Servia or Bulgaria until peace is absolutely assured.

What was believed to be a plot to blow up the palace of the King of Greece at Salonika was discovered on the 22d on the seizure of three carts of fruit at the city gates. Under the sacks of fruit a quantity of explosives was concealed, and the supposed conspiracy is attributed to Bulgarians. Travelers arriving at Athens from Salonika state that Macedonia is overrun by Bulgarian bands led by officers disguised as peasants.

IN THE INSURANCE WORLD

BY W E. UNDERWOOD

Get Insurance Knowledge

No person in this country is to be found fault with because his knowledge of insurance generally is of a superficial character. We are a busy people, and most of us find ourselves fully occupied in mastering and practising the principles of the callings in which we are trying to make a living. Here, if anywhere (it is "every man to his trade." Compared with the workers of the principal producing nations of Europe, we are not thoro; we think we lack time for that. Minutes are money, and we are coiners. We are specialists in quantity and the appearance of goods. Our manufactured articles are comely rather than enduring.

But this devotion of every man to his own business so closely as to leave him no time for the acquisition of information in other directions, or which deprives him of opportunities to secure a correct working idea of the nature of other lines of business upon and to which his own may be dependent or related, has its disadvantages. As an illustration, the merchant or manufacturer knows little of insurance. He depends on a specialist in that line for such service as he may require, and generally does not know whether he is being well or poorly served. And, on the other hand, the insurance man knows little, probably nothing, of his customers' lines of work. It is an agreed state of mutual indifference and ignorance which more often than not results in serious misunderstandings and hostility.

It is to this lack of knowledge respecting the common principles of the insurance business that unwise legislation on that subject is due. The buyers of insurance, for example, do not realize that every burden placed on an insurance company is automatically and instantaneously shifted to their own shoulders. Insurance is nothing more than a distributor—of losses and expenses. The money for carrying it on comes from but one source: the policyholders. It is a business, not a philanthropy. Only those who use its service pay the costs.

The more a man of intelligence learns about insurance the greater becomes his appreciation of it. As a general thing, newly appointed insurance commissioners are harsh and arbitrary in their rulings. This disposition gradually disappears and in a few years we find the same man trying to be a counsellor and guide to the insuring public, endeavoring conscientiously to lead them wisely in the matter of insurance legislation. Robert Lynn Cox, general counsel of the Association of Life Insurance Presidents, in his seventh annual legislative report, just issued, discussing the increase of life insurance legislation during the season of 1912-1913, says of the work done in that connection by insurance commissioners: "The supervising officers of the different states, in their official capacity and also thru the medium of their national convention, are potent factors for good in this respect."

The informed among those officials understand the conditions and appreciate the difficulties consequent upon the enactment of burdensome laws. Supervision of the business by the state finds cheerful acceptance in all insurance offices; most of them would strongly oppose its discontinuance; but the tendency for several years past has been to exceed that function and to invade the jurisdiction of the companies' directors and managers. As the successful conduct of an insurance company requires the services of trained underwriters and skilful financiers, the unwisdom of state interference in operation is plainly apparent. Let the buyers of insurance understand the conditions, let them take time enough to secure just a bare knowledge of how the business is conducted, let this information become general and the cost of the service will decline.

Systematized Misinformation

Dr. Paul S. Fox, of Athens, Mich., favors THE INDEPENDENT with a circular letter he has issued in which he impeaches the sincerity of life insurance company officials in their campaign of opposition to the taxation proposed by the Congress, as provided by the income tax section of the Wilson-Underwood bill. Dr. Fox ironically observes that the companies appear to object strongly to the measure "on the ground that ultimately the tax will come out of the pockets of the policyholders." While this looks plausible, he continues, and even granting it to be true, he believes the tax is just and ought to be laid. He evidently does not

believe that the companies are actuated by any sense of fidelity to policyholders' interests, and adds: "It seems strange that if this tax will come out of the pockets of the policyholders, that the companies are so fearfully concerned about it. The companies," he continues, "are leaving no stone unturned to bring their side of the controversy before the dear people. But with all the agitation the people themselves show no interest; they do nothing, and fail to get excited."

Of course, if Dr. Fox seriously and sincerely entertains the belief that the officers of life insurance companies are opposing the proposed taxation because they "prefer to do their own taxing of the people, instead of letting the government do it," and if, as he intimates, he does not think it will add anything to the expense which policyholders must bear, his position is comprehensible, if not warranted. He is only mistaken. He fails utterly to support the exprest belief that the tax is just and ought to be laid. He doesn't attempt to do so. As a matter of fact, his entire communication bristles with bald assertions.

He jumps at a bound from the tax proposition to the "awful scandals" and "awful looting of life insurance funds in times past," making no effort to connect the two subjects, the obvious motive being, as it appears, to recall something of a discreditable character against the companies to strengthen his statements.

In the same reckless manner he says, "Life insurance companies as a rule carry too much surplus." He fails to say how he obtained that information, and omitted to provide anything by way of proof. We are not sure that he knows what he means by the word surplus. If he is including in that fund the deferred dividends carried on the old tontine contracts, we are quite certain that he doesn't know; for under the departmental rulings all those earnings are written up against the companies as liabilities, and must be carried as such in their annual reports.

Now let us examine his claim. He says that life insurance companies as a rule carry too much surplus. He forgot to tell us what amount would be sufficient, therefore we are unable to arrive at his idea of a safe margin. The records of the companies transacting business in the State of New York will perhaps be regarded as representative of "life insurance companies as a rule," as specified by him. There are thirty-four such, and at the end of 1912 their combined assets were $4,137,121,015 and their combined surplus $129,864,635. That is to say, they have on hand $103.14 for every $100 they owe. That doesn't seem to us to be an unreasonably large overplus. Not enough to permit the managerial extravagance the good doctor seems to think is prevalent.

And that brings us to the corporate expense accounts. They are pictured as of somewhat royal proportions. We are reminded of "palatial buildings," "princely salaries," general extravagance and prodigality "instead of thrift and frugality." After reading over the schedule which follows, we are set wondering if many lines of business are operated at so small a cost. The ratios quoted represent *the total expense* of doing business in 1912, calculated on *total income*. We will use twenty prominent companies for the illustration:

PER CENT OF TOTAL INCOME.

State Mutual, Mass.	13.07
Travelers'	14.91
Union Central	14.26
Union Mutual	14.63

Included in the above list are some of the largest companies in the world; and all of those which lead in the amount of business done annually; those occupying the "palatial office buildings," and employing officers at "princely salaries." It will be noticed, too, that the big ones, those which are supposed to be the most prodigal in their use of policyholders' money, have the lowest expense ratios.

We are afraid that Dr. Fox has either learned too little about life insurance, or suppressed too much in his circular letter. Either his knowledge is superficial or he is disingenuous. At any rate, he has on this occasion disseminated as much misinformation as could be crowded into a closely typed letter sheet.

Notes

Having failed in the courts to establish a fire insurance trust in Cleveland, Ohio, the County prosecutor will take his case before a joint committee of the legislature, which is investigating the matter.

The next annual convention of the International Association of Casualty and Surety Underwriters will occur at the Chateau Frontenac, Quebec, July 8 to 11, inclusive.

FINANCE & TRADE

Tennessee's Bonds

Tennessee failed for a second time, last week, to sell $11,458,000 of forty-year 4 per cent bonds for the refunding of a part of the state's bonded debt which matures on July 1. At the first offering, about three weeks ago, there were bids for only a small part of the amount, and the highest of them was only 86¼, or $862.50 for a bond of $1000. On the 17th, at the second offering, there were bids for only $1,565,000, in the neighborhood of 87½. Therefore the Legislature has authorized the Government to borrow on notes which are to run for two years, bearing interest not exceeding 6 per cent. Bonds also will be sold, but authority for increasing the interest rate to 4½ per cent has been given.

Many recent offerings of municipal bonds have been failures. Tennessee cannot expect to sell 4 per cents for prices higher than those which were shown in the bids. Probably her 4½ per cents will not sell at par. There have been excessive borrowings here and abroad for public purposes. The capital available has been restricted by hoarding or by the direct effect of war. Owing to the increased cost of living, there is a demand for an interest return considerably higher than the average that was attractive or acceptable a few years ago.

The Market for Securities

The recovery which followed Secretary McAdoo's announcement, week before last, that the Treasury was ready to issue emergency currency in response to applications, was not sustained last week on the Stock Exchange. At the beginning of the week the Supreme Court's additional decision in railroad rate cases caused some weakness. Thereafter, until Saturday, however, there was but little change, altho the new currency bill, the failure of Tennessee's bond sale, and a decline of iron and steel prices exerted an unfavorable influence upon prices. Prices fell on Saturday because of dispatches indicating that the Eastern railroad companies' application for permission to increase freight rates by 5 per cent had been rejected by the Interstate Commerce Commission. Transactions for the week amounted to 1,695,855 shares, against 3,490,870 in the week immediately preceding, and the net losses of the active issues ranged from 2½ to 5½ points. Trading in Reading, Union Pacific and Steel was nearly one-half of the week's business.

The railroad companies have regarded their application with much confidence. It has not been finally rejected by the Commission, altho the Commission's action pointed to such a conclusion. On Saturday, the Commission issued an order denying the companies' application for a reopening of the old rate case of two years ago. An hour or two later there was a second order which practically revoked the first one and which directed that an investigation be made. An hour later this second order was rescinded. But this was done for technical reasons, the Commission saying that its conclusions would be announced formally within a few days, when an order in correct form would be issued. It is reported that there is a division of opinion in the Commission. The companies expect, however, that there will be an inquiry and that they will have an opportunity to present their arguments.

Notes

The *Financial Chronicle's* annual estimate shows an increase of 1,196,000 acres, or about 3¼ per cent, in the cotton acreage. About 500,000 have been added in Texas, where nearly one-third of the entire acreage is found.

Another of the former subsidiaries of the great Oil Trust declared a large stock dividend last week. The capital of the Solar Refining Company was increased from $500,000 to $2,000,000, and the stock dividend to the shareholders is 300 per cent.

Reports recently completed show that on the lines of the Pennsylvania Railroad in 1912, when 837,121 trains were moved 40,000,000 miles, carrying about 100,000,000 persons, four passengers were killed in two train wrecks. By falling from trains in motion, twelve lost their lives, three were killed while trying to board moving trains, and eight were struck by trains at stations. In the last five years, only sixteen passengers (out of nearly 500,000,000 carried) have lost their lives on the Pennsylvania lines east of Pittsburgh in train accidents. This is a good record.
